CASE 1579.—Lieutenant Michael Dolan (retired), while 1st Sergeant of Co. E, 2d Infantry, and 25 years of age, was wounded at the battle of Fredericksburg, December 13, 1862. He was carried to the hospital of the 2d division of the Fifth Corps, whence Assistant Surgeon W. R. Ramsey, U. S. A., reported that "a musket ball penetrated the left shoulder; simple cold-water dressings were applied, and the patient was sent to a base hospital." On December 16th, the patient entered Hammond Hospital, at Point Lookout, under the care of Acting Assistant Surgeon John Stearns, jr., who transmitted the following report, and published a duplicate of it.[1] "A minié ball entered left shoulder just inside acromial process of scapula and lodged just below the head of the humerus, splitting off about an inch of that bone at this place. Patient was much prostrated, and confined to bed long after entrance to hospital. When placed under ether for examination, the motion of joint was so good that it was pronounced uninjured. A second examination proved the extent of injury, but his condition did not warrant an operation until March 6, 1863, when the joint was exposed by flap-incision and about two inches of the humerus was removed, with the head. In a week after he was about as usual, and in four weeks from time of operation the wound had healed, the patient progressing most favorably. An opening was made on the inner and posterior aspect of the arm to facilitate the escape of pus, which was slight and of perfectly healthy character. April 5th, everything progressing favorably." This operation was performed by Acting Assistant Surgeon John Stearns, jr., who contributed the specimen (FIG. 471) to the Museum. The catalogue of 1866, page 105, erroneously accredits the donation to Assistant Surgeon C. Wagner, U. S. A., who was in charge of the hospital. In February, 1863, Mr. Dolan was appointed 2d lieutenant of the 2d Infantry. July 23, 1863, he was transferred to the Annapolis General Hospital. Surgeon B. A. Vanderkeift, U. S. V., reports that he resumed duty August 11, 1863. He was promoted to a first lieutenancy January 31, 1866, and retired, "for incapacity resulting from wounds received in the line of duty," December 15, 1870. In January, 1868, Mr. Dolan visited the Museum and permitted a photograph of the injured shoulder to be made. The picture is numbered 192 of the *Surgical Series of Photographs*, Vol. IV, p. 42. A reduced copy of it is presented by FIGURE 472. At this date, the lieutenant had a very useful arm.

FIG. 472.—Cicatrix after an excision for shot injury. [From a Museum photograph.]

CASE 1580.—Private Freeman S———, Co. I, 37th New York, aged 21 years, was wounded in the right shoulder in one of the battles before Richmond, June 30, 1862, and the ball was excised on the field. He was captured and incarcerated for three weeks, and then exchanged and sent to the Fourth and George Streets Hospital, Philadelphia. He was treated by Professor S. D. Gross, who forwarded the specimen from the case, represented in the adjoining wood-cut (FIG. 473), with the following report: "The patient, a stout, muscular man, received a gunshot wound of the right arm and shoulder. A round ball entered the back behind the vertebral border of the scapula, passed beneath the scapula, through the neck of the humerus, and emerged in front of the arm, four inches and a half below the head of the humerus. He was greatly debilitated when he arrived at our hospital on the 27th of July. On the 1st of August, I exsected the head of the humerus along with nearly four inches of the shaft of the bone, which was completely comminuted, some of the splinters being driven in among the muscles. The greater portion of the shaft adherent to the head was necrosed at the time of the operation. In this case I made a single perpendicular incision, which was afterward united by metallic sutures. A considerable portion of the wound healed by the first intention, but there was a great deal of discharge for several weeks from the lower angle. Not a really untoward symptom occurred, and Snow was discharged from the hospital, October 20, 1862, in excellent health and flesh. The parts were perfectly cicatrized, and he had a very good use of the limb. A large amount of callus was thrown out from the extremity of the humerus." The specimen consists of the head and outer portion of the shaft of the right humerus, three and a half inches in length, excised two months after the injury. The articular surface was not involved, but the surgical neck was comminuted by a round ball. The specimen shows only the head and the large fragments attached. (See *Surgical Series of Photographs*, Vol. III, p. 24.) On October 25, 1862, Snow was discharged the service and pensioned. Examiner Nelson Peck, of Lyons, New York, reported, in 1863, that the upper arm was useless, but that "he had some use of the forearm and hand." The pensioner went to reside in Cambridge, Massachusetts, and his pension was successively increased, on January 6, 1866, and August 5, 1872, from $8 to $15, and then to $18 per month. He was paid on March 4, 1874.

FIG. 473.—Exsised head and part of the shaft of right humerus. *Spec.* 387.

[1] STEARNS (J., jr.), *A few Cases of Excision of the Elbow and Shoulder Joints*, in *Boston Med. and Surg. Jour.*, 1863, Vol. LXVIII, p. 252.

The two following cases are remarkable for the extent of consecutive removal of necrosed or carious portions of the shaft, with retention of the functions of the forearm. They may be compared, in regard to this feature, with the case of Cleghorn, described on page 568, where necrosis of the diaphysis and condyles followed a primary excision:

CASE 1581.—Private J. P. Kegerreis, Co. B, 2d Pennsylvania Heavy Artillery, aged 19 years, was wounded at Petersburg, June 17, 1864, and was treated in the hospital of the Ninth Corps, at City Point, until July 3d, when he was transferred to the 1st Division hospital at Alexandria. Surgeon Edwin Bentley, U. S. V., recorded: "Shot through right shoulder, the ball entering in front of the clavicle two inches from the acromial end, passing through the surgical neck of the humerus, and out near the centre of the deltoid muscle. November 19th: Excision of the upper part of the humerus, under chloroform, by a perpendicular incision from the acromion, through the deltoid, five inches in length, exposing the shaft of the bone, and sawing through the latter with a chain saw, and then disarticulating the head of the bone; length of bone removed, four and a half inches; long head of biceps not divided. He recovered slowly. At the time of operation, there was anchylosis of the shoulder, with slight swelling laterally, and much swelling in front; pus was discharging freely through the openings made by the ball, and at an incision in the anterior surface. The patient's condition was not very good; his constitution had evidently suffered from the excessive discharge from the wound; tongue coated; pulse 70; appetite poor. November 21st: Slight chill in the morning; pulse 120; beef tea. November 23d: Chill at 5 a. m.; pulse 128; at 1 p. m., another chill; pulse 130. Five grains of sulphate of quinia were given every eight hours, and milk punch. November 24th: Pulse 116; milk punch, beef tea, chicken broth. November 26th: Locally, water dressings and poultices, when painful. Opiates have been given to relieve pain and procure sleep. There has been gradual improvement since last date, and now, January 1, 1865, the patient sits up." On February 26th, this man was transferred to Sickel Barracks, and thence discharged, May 29, 1865, and pensioned. Dr. H. W. Sawtelle reported from the Pension Bureau, where the pensioner was then employed in clerical duty: "Pensioner states that, about one year after he left the service, nine fistulous openings discharged; the arm from elbow to shoulder becoming greatly enlarged, and his general health rapidly failing. December 17, 1867, Dr. J. L. Suesserott, of Chambersburg, removed a sequestrum of about six inches by enlarging the orifice from which it pointed, extending from the point of resection to the elbow, the patient being under the influence of nitrous oxide gas. He returned to his home, a distance of twenty miles, on the same day, no untoward symptoms occurring, and is now enjoying excellent health. The sinuses were all healed by April 1, 1868, and never reopened. The elbow joint is anchylosed in a semi-flexed position, and firm ligamentous union has taken place in the arm, so that the subject is able to lift about 135 pounds with the injured limb. Eleven well-marked cicatrices appear on the arm and side. The temperature of the limb is normal." The excised head, with a sequestrum of the shaft, is represented by the wood-cut (FIG. 475); it was presented to the Museum by Dr. Sawtelle. In April, 1868, Mr. Kegerreis called at the Museum, and a picture of the injured limb was made, and numbered 289 of the *Surgical Series of Photographs*, Vol. VI, page 39. (See FIG. 474.) This pensioner is still (May, 1875) employed as a clerk in the Pension Bureau, using his right arm with comparatively slight inconvenience.

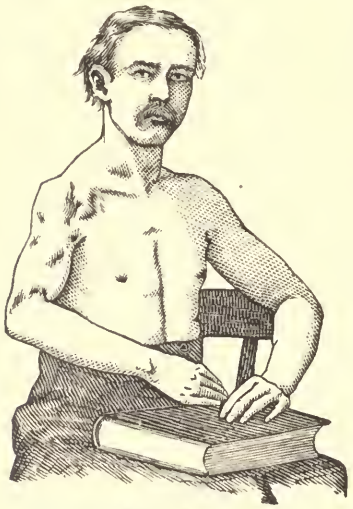

FIG. 474.—Cicatrices six years after an excision of the upper part of the humerus, followed by necrosis of the shaft. [From a Museum photograph.]

FIG. 475.—Excised carious upper end of right humerus, with a tubular sequestrum from shaft. *Spec.* 5711. ¼.

FIG. 476.—Carious head and greater part of right humerus removed in three successive operations.

CASE 1582.—Private George P———, Co. B, 44th Illinois, aged 27 years, wounded in the arm at Chickamauga, September 19, 1863, was treated in hospitals on the field, and at Nashville, Louisville, Jeffersonville, Madison, and Quincy, arriving at the latter place July 27, 1864. Surgeon D. P. Brinton, U. S. V., reported that "a conical bullet had passed directly through the right humerus, at the upper third, in front. On admission, there was erythematic inflammation about the shoulder; it appears as though the bone might have been split into the joint. Simple dressings were applied to the wound, and tincture of iodine to the integuments about the shoulder; special diet given. August 6th, an opening was made from which pus flowed freely; wound still suppurating." He was discharged the service September 29, 1864, for disability on account of "gunshot wound of the right arm," and pensioned. The subsequent history of the case was furnished by C. M. Clark, late surgeon 39th Illinois, who reported: "Parce entered the Soldiers' Home Hospital, Chicago, in January, 1865, with caries of the upper third of the humerus, involving the head of the bone, with free discharge of pus from distinct sinuses on the dorsal surface of the arm. An operation for excision of the head was performed, April 7, 1865, by Dr. E. Andrews, when the head of the bone and a portion of the shaft were removed measuring three and three-quarter inches in all. The wound did not heal readily, erysipelas occurring, with considerable sloughing. I first saw the case June 16, 1867, at the time I took surgical charge of the Home. The arm was then swollen and painful, with discharge of sanious pus; denuded bone could be felt when the probe was introduced, and the patient was anxious for another operation, saying that he could not survive such torture as the limb constantly gave him. He was placed on full and

nutritious diet, with stimulus, receiving great benefit and gaining largely in flesh and strength. On August 2, 1867, he was placed under the influence of chloroform, and two and a half inches of the bone were removed by longitudinal incision on the outer surface of the arm. The bone removed was greatly diseased and shell-like in structure; the medullary cavity was greatly increased in diameter, and its contents bleeding very freely when section was made. The space occupied by bone prior to the previous operation was filled with cartilaginous matter, with some few points of ossific deposit. The wound was dressed after the usual manner, with sutures, adhesive strips, splint and bandage, and plenty of cold water. Several of the stitches were removed on August 7th, at which time the wound was doing nicely. By September 1st, the wound had nearly healed, and the man expressed himself as feeling first rate, and was able to use the arm to some extent. On September 15th, he had a chill, with subsequent fever, and from this date the arm became painful and commenced again to discharge. The probe detected more dead bone, and another operation was decided upon, which was performed October 3, 1867, when three inches more of the bone were removed, the portion removed presenting the same characteristics as the former piece. The wound healed readily, and ceased entirely to trouble him. In March, 1868, he could use the arm to some advantage, feed himself with it, and take off his hat. He left the Home in the latter part of March and went to his residence, since which time I have not heard from him." The specimen (FIG. 476) consists of the head and a portion of the shaft of the right humerus, removed in three operations, and in all eight and three-quarter inches, and was contributed by Dr. Clark, who performed the last two operations. A Board of Examiners, composed of W. C. Lyman, F. A. Emmons, and E. O. F. Roler, of Chicago, reported, September 15, 1873: "Removal of entire shaft of the right humerus, including the head of the bone and the condyles below; slight use of fingers; disability total." The pensioner was paid to March 4, 1874.

§ *Unsuccessful Operations.*—The excisions of the head with adjacent portions of the shaft reported as secondary procedures, and resulting fatally, were twelve in number:

CASE 1583.—Private Frederick K———, 14th Infantry, aged 31 years, was wounded at Spottsylvania, May 12, 1864, and entered Lincoln Hospital, Washington, on May 26th. Acting Assistant Surgeon A. Ansell reported: "When admitted, his wounds were healing very kindly, and he continued to do well until June 22d, when the limb began to swell, the lips of the wound having a phagedenic appearance, and he complained of severe pain in the shoulder. June 24th: He was removed to the operating room and the injury was examined under ether, when the shaft of the humerus was found to be so fearfully comminuted that resection was at once performed, by Assistant Surgeon J. C. McKee, U. S. A. The head and three and a half inches of the shaft were removed, and the wound was dressed with water dressings. He continued to do well until June 28th, at noon, when severe rigors supervened, accompanied by pain in the limbs, cough, and vomiting of bilious matter. His countenance became dull; he was at times delirious; the pulse was quick, small, and thready. Ordered five grains of carbonate of ammonia and fifteen grains of chlorate of potash every two hours, alternated with ten grains of sulphate of quinia in half an ounce of brandy. His respiration was hurried, at 40 a minute; he had pain in the left thorax; there was loud, small, and large crepitation in this region. The patient continued in this way, gradually failing, and expired at noon, June 30, 1864." The *post-mortem* examination was made by Acting Assistant Surgeon H. M. Dean, who forwarded the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 109, *Spec.* 2719), with the following report: "Examination eight hours after death: Body not much emaciated. Had been wounded through the upper third of the arm. From the looks of the wound the ball entered two inches below the joint on the posterior surface, and was cut out immediately above the insertion of the pectoralis major muscle. Five and a half inches of the upper part of the humerus had been excised. Ligatures were still attached. The wound was in a sloughing condition, and there was no appearance of granulation. The glenoid cavity was normal. The upper extremity of the lower part of the humerus was denuded of its periosteum for one and a quarter inches."

CASE 1584.—Private T. T. P———, Co. A, 3d Michigan, aged 20 years, was wounded at Fair Oaks, May 31, 1862. He was sent to Christian Street, and thence to Haddington Hospitals, Philadelphia, and transferred, March 31, 1863, to Satterlee Hospital. Acting Assistant Surgeon J. H. Packard reported: "Wounded by a ball of unknown character, passing through the left humerus from before backward, about four inches below the articulation of the shoulder. Several sinuses existed both in front of the arm and behind it, leading to dead bone. The orifice of exit of the ball had entirely closed. Pending arrangements for his removal to a Michigan hospital at Detroit, I proposed to him the extraction of the dead bone from his arm, and he readily consented. Accordingly, on the 9th of April, he was placed under the influence of chloroform, and the sinuses were laid open posteriorly so as to expose the affected portion of the bone. It was now found that the whole of the upper part of the humerus was so degenerated as to forbid all hope of its again becoming of use. The posterior incision was therefore continued transversely through the deltoid, so as to form an external flap, which, being raised up, the head of the humerus was freed from its articular connections, and the bone cut through below with bone nippers. Very little bleeding ensued, only three vessels needing ligation. Cold water was applied locally, and opium given to allay pain and promote sleep. He did very well until the night following April 16th, when he had what was considered a chill, followed by fever, with delirium and sweats. These symptoms proved the next day to have been the precursors of inflammation of the right lung. April 17th, I saw him at 6.30 P. M., and ordered six cut cups over the lower part of the right lung, beef essence and milk punch, with a febrifuge and anodyne mixture. Wound doing very well. On the 18th, Dr. Da Costa saw him, in consultation with me, and advised a mixture containing carbonate of ammonia, acetate of morphia, syrup of senega, and tincture of veratrum viride. Pulse ranging above 120; some delirium constantly; aggravated at night. 20th, Drs. Da Costa and Page saw him with me. His pulse was 136; tongue moist; slightly coated white. Bowels confined, abdomen excessively tympanitic, interfering with respiration, already impeded by the inflammation of the lung. I ordered an injection of spirits of turpentine, sixty drops in two ounces of starch water, every two hours; the brandy and milk to be given every hour. After two of the enemata, he became decidedly more comfortable, and his bowels were three times moved quite freely. All this time, the wound continued to do well. At two o'clock P. M., by order of the surgeon in charge of the hospital, the treatment was changed; a mixture of tincture of ergot, one ounce, and tincture of camphor, half an ounce, being prescribed, one drachm to be given every two hours. The brandy, etc., to be continued. April 21st,

some pain toward the base of the left chest; respiration more limited; pulse 136; countenance very unfavorable; delirium constant; no additional distention. No change in the treatment. 22d, Drs. Stille, Da Costa, and Halsey were ordered to consult with me in regard to the case. Upon examination, we found the pneumonia to have involved the left lung as well as the right. The physical signs of effusion into the pleuræ were also present. The patient's general condition was very bad; his pulse rapid and windy; his respiration impeded; his countenance anxious; his restlessness constant. The following treatment was ordered: half an ounce of brandy, with one and a half ounces of milk, every two hours at least; two ounces of beef essence every two hours; half a grain of aquæous extract of opium every three hours; the anterior surface of the chest to be painted with tincture of iodine. The patient, however, sank rapidly, and died the same day, at about five o'clock P. M." The following report of the *post-mortem* examination was made by Professor Joseph Leidy: "No restoration of the bone existed. Diagnosis of case, pneumonia; body large and rather fat; heart healthy; right pleural cavity contained about a quart of pus, the left about a pint of serum; right lung with comparatively recent pleurisy; the lower lobe covered with soft, yellowish, ragged pseudomembrane, and more or less adherent to the phrenic and costal pleuræ. More moderate pleuritic inflammation, with thin pseudomembrane, and partial attachments of the upper and middle lobes. Pleurisy of the left lung in a large circumscribed patch on the convex surface, about the size of the hand; the patch being adherent by recent pseudomembrane to the costal pleura. Both lungs, but especially their lower lobes, were affected with lobular pneumonia. The indurated masses, about the size of hickory nuts, were cream colored and infiltrated with pus. Some of the masses had broken down into cavities filled with pus. The bronchial mucous membrane throughout was inflamed. The abdominal viscera were all healthy. The lobular pneumonia was most probably metastatic inflammations and embolical in their origin." The specimen, No. 1875 of the Surgical Section, contributed by the operator, consists of "the head and three and a half inches of the shaft of the left humerus excised ten and a half months after injury, for perforation by gunshot of the surgical neck, followed by necrosis of the internal structures and a decided deposit of new bone internally. The specimen shows a portion of the shaft to have been removed by a trephine, of which there is no account in the history."—*Cat. Surg. Sect.*, 1866, p. 109.

TABLE XXXVI.

Summary of Twelve Fatal Cases of Secondary Excisions of the Head and Portions of the Shaft of the Humerus for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	*Bennett, O. A.*, Sergeant, I, 11th Virginia.	May 16, 1864.	Minié ball grazed the head of the humerus and emerged near the spine of the scapula.	June 29, 1864.	Four inches of the humerus, including the head, removed through a vertical incision.	Died July 6, 1864.
2	Cushing, W., Pt., B., 40th New York, age 24.	May 5, 1864.	Musket ball passed through the surgical neck of the right humerus, comminuting the head of the bone considerably.	June 11, 1864.	Excision of the head and three inches of the shaft through a straight incision, by A. A. Surg. H. B. Knowles.	Died July 16, 1864.
3	Kase, F. M., Pt., 14th Infantry, age 31.	May 12, 1864.	Comp'd comminuted shot fracture of the head and upper portion of shaft of the right humerus.	June 24, 1864.	Excision of the head and three and a half inches of the shaft, by Asst. Surg. J. C. McKee, U. S. A.	Did well until June 28. Rigors, vomiting, delirium. Died June 30, 1864, of pyæmia. *Spec.* 2719, A. M. M.
4	Henry, G., Sergeant, E, 35th Massachusetts.	Sept. 17, 1862.	Anterior portion of the surgical neck and lower portion of both tuberosities of right humerus carried away by shot.	Oct. 21, 1862.	Excision of the head and one-half inch of the shaft, by Asst. Surg. C. A. McCall, U. S. A.	Died November 3, 1862, of pyæmia. *Spec.* 330, A. M. M.[1]
5	Merriman, J., Pt., E, 155th Pennsylvania, age 26.	May 5, 1864.	Shot wound of right shoulder, fracturing the scapula and involving the shoulder joint.	June 15, 1864.	Excision of the head and one inch of the shaft, by Asst. Surg. W. F. Norris, U. S. A.	Died July 14, 1864; asthenia. *Spec.* 3559, A. M. M.
6	Minot, E. G., Pt., M, 1st Maine Artillery, age 25.	June 16, 1864.	Musket ball lodged in and fractured the head of left humerus and a part of the shaft.	Aug. 10, 1864.	Excision of the head and two inches of the shaft through incision over joint, by A. A. Surg. W. C. Flowers.	Died September 17, 1864, from pyæmia.
7	Peterson, T. F., Pt., A, 2d Michigan, age 20.	May 31, 1862.	Musket ball perforated the left arm from before backward, about two inches below the acromion.	Apr. 7, 1863.	The head and three and a half inches of the shaft exsected, by A. A. Surg. J. H. Packard.	Died April 22, 1863, of pneumonia. *Spec.* 1875, A. M. M.
8	Robinson, L., Pt., E, 4th Colored Troops, age 29.	Sept. 29, 1864.	Shot fracture of the head of left humerus; portion of shaft and coracoid process of scapula also fractured.	Nov. 10, 1864.	Excision of the head and two inches of the shaft, by A. A. Surg. O. Warner.	Died November 14, 1864. *Spec.* 4003, A. M. M.
9	Spitler, S., Pt., K, 49th Ohio, age 19.	May 27, 1864.	Left humerus shattered below surgical neck without opening the joint; ball perforated left thorax.	July 19, 1864.	Head and four inches of shaft resected, by A. A. Surg. H. C. May.	Died July 26, 1864, of exhaustion. *Spec.* 3369, A. M. M.
10	Stiles, L. H., Pt., G, 9th Massachusetts, age 30.	Jan. 10, 1864.	Comp'd comminuted fracture of surgical neck of the left humerus by minié ball; same ball comminuted the lower maxilla.	Feb. 16, 1864.	Excision of the head and two and a half inches of the shaft through a V-shaped incision, by Surgeon O. A. Judson, U. S. V.	Died February 27, 1864; pyæmia. *Spec.* 2112, A. M. M.
11	Sweat, J., Pt., B, 58th Illinois.	April 9, 1864.	Shot fracture of left humerus by a minié ball.	May 20, 1864.	Excision of the head and one inch of the shaft through a vertical incision, by Surgeon J. G. Keenon, U. S. V.	Died May 24, 1864, of pneumonia.
12	Welch, J., Pt., C, 61st New York, age 20.	May 5, 1864.	Conoidal ball passed through the head of the left humerus, deeply grooving it.	Aug. 27, 1864.	Excision of the head and one inch of the shaft, by A. A. Surg. W. P. Moon.	Died Mar. 4, 1865, of pneumonia. *Spec.* 3618, A. M. M.

In seven of eleven cases in which the point was referred to, the operations were on the

[1] COUES (E.), *Excision of Head of Humerus*, in *The Med. and Surg. Reporter*, Philadelphia, 1862–3, Vol. IX, p. 231.

left side. Pyæmic infection appears to have been the most frequent cause of death. In eight of the cases, pathological preparations of the injured bones were transmitted to the Museum.

Excisions of the Upper Part of the Humerus for Shot Injury of Undetermined Date.—In nineteen of the five hundred and seventeen cases of excisions of the head with adjacent portions of the shaft of the humerus, after shot fracture, it was impracticable to ascertain the intervals between the dates of injury and of operation, either by the operators' or hospital reports, the pension examiners' reports, or by any other accessible sources of information. The recoveries, and the fatal cases, of which there were two only, will be summed up in a single tabular statement:

TABLE XXXVII.

Summary of Nineteen Cases of Excision of the Head and Portions of the Shaft of the Humerus for Shot Injury, in which the Intervals between the Injuries and Operations were not ascertained.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Cromie, J., Captain, F, 12th New York, age 30.	June 27, 1862.	Shot fracture of right shoulder joint.	.....	Upper half of the humerus resected, by a Confederate surgeon, while a prisoner.	Disch'd April 7, 1863; pensioned. "Arm almost useless." Died August 9, 1870.
2	De Bank, W., Pt., D, 20th Connecticut, age 31.	May 3, 1863.	Comp'd comminuted fracture of head of the left humerus by a conoidal ball, which also wounded the lung and intercostal artery; aneurism.	.....	Head and more than one-third of the shaft removed while a prisoner at Richmond.	Disch'd Nov. 11, 1863; pensioned. Died January 30, 1864.
3	*Enbank, J. N.*, Sergeant, C. S. Artillery.	Sept. 14, 1863.	Gunshot wound of the right shoulder.	.....	Excision of three inches of the upper extremity of humerus, including the head.	Recovered; furloughed January 12, 1864.
4	Faunce, P. C., Pt., I, 6th Ohio Cavalry, age 20.	May 4, 1864.	Shot fracture of left shoulder joint.	1864.	Head and about three inches of the shaft of humerus excised.	Disch'd Dec. 9, 1864; pensioned.
5	Fleming, J. A., Pt., G, 21st Illinois.	Dec. 31, 1862.	Comminuted shot fracture of the head and neck of right humerus.	.....	Head and a portion of the shaft, about three inches in all, removed, by Surg. R. G. Bogue, 19th Illinois.	Disch'd May 23, 1863; pensioned.
6	*Gill, R. C.*, Pt., H, 13th Alabama, age 24.	May 12, 1864.	Musket ball passed through the left shoulder joint.	.....	Head and three inches of shaft of humerus excised.	Recovered; retired Feb. 13, 1865.
7	Hunter, N., Pt., C, 22d Michigan.	Sept. 19, 1863.	Shot fracture of right humerus; also wound of chest.	1863.	Excision of the upper third of the humerus.	Died October 8, 1863.
8	Kessler, C., Pt., I, 2d Wisconsin, age 26.	July 21, 1861.	Shot fracture of left shoulder, involving head of humerus.	1861.	Excision of the head and four inches of shaft, by Surgeon R. B. Bontecou, U. S. V.	Disch'd Feb. 4, 1862; pensioned.
9	*Knot, F. R.*, Pt., G, 7th Virginia Cavalry.	.....	Shot fracture of the head and neck of the humerus.	May 31, 1864.	Excision of the head and four inches of shaft, by Surgeon C. B. Gibson, C. S. A.	Never rallied. Died May 31, 1864.
10	*Quarier, M.*, Sergeant Major, 22d Virginia, age 26.	May 15, 1864.	Shot fracture of the shoulder joint.	1864.	Excision of the head and upper part of shaft of humerus.	Recovered; retired Dec. 3, 1864.
11	Ruggles, J., Pt., D, 121st Ohio, age 21.	Sept. 20, 1863.	Fracture of the head of left humerus by a minié ball.	.....	Removal of the head and one inch of shaft of humerus.	Disch'd Oct. 28, 1864; pensioned.
12	*Saulsburg, J. L.*, Sergeant, D, 66th Georgia, age 19.	.....	Shot fracture of upper portion of humerus.	.....	Excision of the head and five inches of shaft of humerus.	Recovered; retired Dec. 3, 1864.
13	Scott, J. F., Pt., A, 21st North Carolina, age 24.	Aug. 28, 1862.	Fracture of upper portion of left humerus by a minié ball.	.....	Excision of the head and two inches of shaft of humerus.	Retired Feb. 18, 1865. Anchylosis of joint.
14	Shiney, A., Pt., I, 18th Massachusetts, age 33.	Aug. 30, 1862.	Shot fracture of left shoulder joint.	1862.	Excision of the head and three inches of shaft of humerus.	Disch'd Dec. 24, 1862; pensioned.
15	Shinn, W., Pt., K, 30th Illinois, age 30.	May 16, 1863.	Shot fracture of right humerus.	1863.	Excision of the head and a portion of the shaft of humerus.	Disch'd Oct. 15, 1863; pensioned.
16	Smith, T. B., Corporal, B, 93d Illinois, age 20.	May 16, 1863.	Shot fracture of upper third of left humerus.	.....	Excision of the head and a portion of the shaft of humerus through a straight incision.	Disch'd Oct. 7, 1864; pensioned.
17	*Taylor, G. W.*, Pt., B, 53d North Carolina, age 24.	May 30, 1864.	Gunshot wound of shoulder, with fracture of upper portion of humerus.	1864.	Excision of the head and three inches of the shaft of humerus.	Furloughed July 16, 1864, cured.
18	*Taylor, J. D.*, Pt., I, 3d Alabama Cavalry, age 19.	July 3, 1864.	Shot fracture of left humerus.	.....	Excision of head and upper extremity of shaft of humerus.	Recovered; retired Feb. 3, 1865.
19	*Williford, J. W.*, Pt., A, 43d North Carolina.	May 23, 1864.	Shot wound and fracture of the right arm.	.....	Excision of the upper half of the humerus.	Retired March 14, 1865.

EXCISIONS AT THE SHOULDER; PARTS NOT DEFINITELY DISTINGUISHED.—In thirty-nine of the eight hundred and eighty-five excisions at the shoulder for shot injury, the extent of bone removed was not precisely specified, and this and other imperfections in the reports precluded their distribution in the foregoing subdivisions. It is possible to state, however, that such dates were furnished as proved that twenty-seven of these operations were primary, and for the most part field cases. The recoveries and fatal cases will be tabulated together on the following page.

TABLE XXXVIII.

Summary of Thirty-Nine Cases of Excisions after Shot Injury involving the Shoulder, in which the precise Portions of Bone removed have not been ascertained.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Allen, E., Pt., A, 59th New York.	July 3, 1863.	Shot wound of right shoulder..	July 3, 1863.	Resection of the shoulder joint.	Died July 15, 1863.
2	Anderson, M., Pt., E, 19th Illinois.	Sept. 19, 1863.	Shot wound of the left upper extremity.	Sept. 19, 1863.	Resection of the shoulder joint.	Died Sept. 29, 1863.
3	Barcroft, L. S., Pt., B, 18th Ohio.	Dec. 31, 1862.	Shot wound of the shoulder....	Dec. 31, 1862.	Excision.....	Died February 5, 1863.
4	Barr, H., Pt., K, 117th New York, age 45.	Sept. 29, 1864.	Gunshot wound	1864.	Excision of the shoulder joint..	Died October 1, 1864, while a prisoner at Richmond.
5	Baufman, G., Pt., 1, 73d Ohio, age 32.	Mar. 19, 1865.	Shot wound of right shoulder joint.	Mar. 19, 1865.	Excision at the shoulder.....	Died March 28, 1865.
6	Bennett, D., Pt., G, 8th Pennsylvania Cavalry, age 31.	1864.	Shot wound of the shoulder....	1864.	Resection of the shoulder joint.	Died May 22, 1864, while a prisoner at Richmond.
7	Day, A., Pt., C, 23d Massachusetts, age 22.	1864.	Shot fracture.....	1864.	Resection of the shoulder joint.	Died May 31, 1864, while in the hands of the enemy.
8	Day, W. H., Pt., F, 17th Maine.	July 3, 1863.	Shot fracture of right shoulder joint.	1863.	Resection of the shoulder joint	Died August 31, 1863.
9	Day, W. H., Pt., 4th New York Battery.	July 3, 1863.	Fracture of left shoulder joint by a shell fragment.	July 3, 1863.	Excision of the shoulder joint..	(?)*
10	Douglas, E., Pt., B, 93d Illinois.	Nov. 25, 1863.	Fracture of snoulder by a conoidal ball; also wound of chest.	Nov. 25, 1863.	Excision, by Surg. J. R. Mohr, 10th Iowa.	Died December 20, 1863.
11	Eaton, W., Pt., C, 4th Massachusetts.	June 14, 1863.	Shot wound through left arm and left lung.	June 17, 1863.	Resection of the shoulder joint.	Died June 21, 1863.
12	Edel, E., Pt., M, 13th Pennsylvania Cavalry.	Oct. 12. 1863.	Shot wound of the left shoulder.	1863.	Resection of the left shoulder..	Died November 3, 1863.
13	Ellis, J., Pt., D., 81st Illinois.	May 22, 1863.	Fracture of right shoulder by musket ball.	May 22, 1863.	Resection of shoulder	Died June 19, 1863.
14	*Fay, E.*, Pt., I, 5th North Carolina.	July 3, 1863.	Shot fracture of left shoulder joint.	1863.	Resection at the shoulder.....	(?)
15	*Fussel, J. P.*, Pt., I, 9th Georgia.	Aug. 30, 1862.	Shot wounds involving right shoulder joint.	1862.	Resection of right shoulder....	Died September 11, 1862.
16	*Gray, W.*, Pt., D, 10th Alabama.	.....	Gunshot wound of the right shoulder joint.	.....	Resection of joint.....	(?)
17	Green, C. B., Pt., A, 26th Massachusetts, age 25.	1864.	Wound of left shoulder joint..	1864.	Resection of shoulder.....	Died June 24, 1864.
18	Hains, A., Pt., D, 91st New York.	June 14, 1863.	Severe buckshot wound of left shoulder.	June 18, 1863.	Resection of shoulder joint, by Surgeon W. G. Provost, 159th New York.	Died June 24, 1863.
19	*James, J.*, Pt., D, 6th Virginia.	1864.	Gunshot wound of right shoulder.	1864.	Resection of the right shoulder joint.	Died August 6, 1864.
20	Kelly, J., Pt., K, 18th Wisconsin.	May 14, 1863.	Wound of left upper extremity.	May 16, 1863.	Excision of the left shoulder..	Died May 20, 1863.
21	Lamb, J., Pt., D, 30th Ohio.	June 17, 1863.	Wound of left shoulder.....	June 17, 1863.	Resection of shoulder	Died August 13, 1863.
22	*Lynch, J. B.*, Lieutenant, G, 58th Virginia, age 33.	May 3, 1863.	Wound of left shoulder joint...	May 3, 1863.	Resection of shoulder joint by deltoid flap.	Died June 1, 1863, of hæmorrhage.
23	Mitchell, C. T., Pt., 19th Indiana Battery.	Oct. 8, 1862.	Shot wound of the shoulder....	Oct. 8, 1862.	Resection of the shoulder joint.	Died Oct. 15, 1862, of hæmorrhage.
24	Narigan, J., Pt., E, 80th Ohio, age 22.	Nov. 25, 1863.	Shot wound of the chest, involving the shoulder joint.	Nov. 25, 1863.	Excision of the shoulder joint, by Surgeon E. J. Buck, 18th Wisconsin.	Discharged September 24, 1864; pensioned.
25	*Pitt, L. N.*, Lieutenant, B, 2d North Carolina.	1863.	Gunshot wound of left shoulder.	1863.	Excision of the shoulder joint..	Transferred to general hospital, November 2, 1863.
26	Ream, B., Lieutenant, C, 7th Iowa.	Nov. 7, 1861.	Wound of right shoulder joint; also wound through lung.	Nov. 7, 1861.	Excision of the shoulder joint..	Died November 21, 1861.
27	Riley, V., Pt., C, 90th New York.	June 14, 1863.	Gunshot wound of the right shoulder.	June 14, 1863.	Resection of the shoulder joint.	Died June 24, 1863.
28	Ritchie, P., Corporal, K, 99th Pennsylvania.	Oct. 28, 1864.	Shot fracture of left shoulder; ball lodged in the dorsum of scapula.	Nov. 13, 1864.	Shoulder joint excised; thirty pieces of bone removed.	Disch'd July 1, 1865; pensioned.
29	*Scoggins, J. B.*, Pt., K, 56th Georgia.	.....	Wound of right shoulder joint.	.....	Resection of the shoulder joint.	(?)
30	*Simmons, W. T.*, Pt., B, Palmetto Sharpshooters, age 22.	Oct. 7, 1864.	Shot wound of right shoulder joint.	Oct. 8, 1864.	Resection of the right shoulder joint.	Furloughed November 1, 1864.
31	*Stansil, I.*, Sergeant, C, 8th South Carolina.	July 3, 1863.	Gunshot wound of left shoulder.	July 3, 1863.	Resection of the shoulder joint.	Died July 18, 1863.
32	Thoman, M. A., Lieut. Col., 59th New York, age 33.	July 2, 1863.	Wound of right shoulder.....	July 2, 1863.	Resection of the shoulder joint, by Surg. N. Hayward, 20th Massachusetts.	Died July 11, 1863.
33	Wagner, J., Pt., G, 93d Illinois.	Nov. 25, 1863.	Shot fracture of right shoulder.	Nov. 25, 1863.	Excision of the shoulder joint, by Surgeon E. J. Buck, 18th Wisconsin.	Died November 29, 1863.
34	*Watson, W.*, Pt., F, 5th South Carolina.	Oct. 29, 1863.	Shot fracture of humerus and scapula.	Oct. 29, 1863.	Resection of the shoulder joint, by Surgeon A. K. Fifield, 29th Ohio.	Died January 9, 1864.
35	*White, W. P.*, Pt., A, 36th Alabama.	Nov. 25, 1863.	Gunshot wound of left shoulder.	Nov. 25, 1863.	Resection of the shoulder joint, by Surgeon A. T. Hudson, 26th Iowa.	(?)
36	Winnacht, A., Pt., D, 32d Indiana.	Jan. 1, 1863.	Gunshot wound of left shoulder joint.	Jan. 1, 1863.	Resection of left shoulder joint.	Died February 24, 1863.
37	*Winningham, J. W.*, Corporal, Hart's Battery.	.....	Wound of left shoulder joint...	.....	Excision of the left shoulder...	(?)
38	Wright, W., Pt., G, 184th Pennsylvania.	June 22, 1864.	Shot fracture of left shoulder joint.	June 22, 1864.	Excision of the joint on the field, by Surgeon G. Chaddock, 7th Michigan.	Died July 10, 1864.
39	Wykert, E., Pt., B, 18th Ohio.	Dec. 31, 1862.	Wound of shoulder.....	1863.	Resection of the shoulder joint.	Died March 28, 1863.

* The interrogation marks denote those cases in which the ulterior results were not learned.

There were three recoveries after primary operations, and twenty-two fatal results; in two primary cases the terminations are unknown. There were seven cases with fatal results, and five with undetermined results, among the operations of unknown date.

Concluding Observations on Excisions at the Shoulder after Shot Injury.—The opinions regarding this operation expressed in the preliminary surgical report,[1] derived from the results of five hundred and eight determined cases, require some serious corrections, and other very slight modifications, since the additions made to the statistical data, and the more exhaustive analysis the entire material has undergone. The following consolidation will facilitate a review of the subject:

Table XXXIX.

General Numerical Summary of the Eight Hundred and Eighty-five Excisions at the Shoulder, after Shot Injury, enumerated in the Seventeen preceding Tables.

Parts of Shoulder Joint Excised.	Primary.				Intermediary.				Secondary.				Undetermined.				Totals.			
	Recovery.	Fatal.	Result not stated.	Total.	Recovery.	Fatal.	Result not stated.	Total.	Recovery.	Fatal.	Result not stated.	Total.	Recovery.	Fatal.	Result not stated.	Total.	Recovery.	Fatal.	Result not stated.	Aggregates.
Head, or Head and Shaft, with portions of either Scapula or Clavicle, or of both.	17	2	1	20	5	6	....	11	8	2	....	10	1	....	....	1	31	10	1	42
Partial Excisions of the Head of Humerus	3	....	....	3	3	....	....	3	6	....	....	6	1	1	....	2	13	1	....	14
Head of Humerus	119	56	....	175	21	34	....	55	13	13	....	26	12	4	1	17	165	107	1	273

	355	160	3	518	120	104	....	224	65	27	....	92	31	14	6	51	571	305	9	885

In eight hundred and seventy-six cases the results as to fatality are known; in eight hundred and thirty-one of them, the stages at which the operation succeeded the injury are also determined. In three instances, the period of operation was stated, but not the final result; and, in six, both factors were wanting. The ratio of mortality in five hundred and fifteen primary excisions,[2] in which the results were ascertained, was 31.06 per cent., or more than 7 per cent. higher than indicated by the preliminary report. The terminations of each of the two hundred and twenty-four intermediary[3] operations were traced, and the death-rate amounted to 46.4 per cent., a sufficiently significant indication of the hazard attending operative interference during the inflammatory stage. The results of ninety-two

[1] *Circular* 6, S. G. O., 1865, p. 55. In this report, 575 excisions at the shoulder were reported, 252 primary, and 323 consecutive. The results, however, of 43 of the former, and of 25 of the latter, were undetermined; and the mortality rates of 23.8 for primary, and of 38.5 for consecutive, operations was deduced from 210 primary and 298 consecutive excisions, or 508 operations with ascertained results. Further investigation has disclosed that a large proportion of the 67 then undetermined cases eventually had a fatal result. The ratios of mortality now given may be regarded as near approximations to precise truth, inasmuch as the results as regards recovery or fatality are known in all save 9 of the 885 operations.

[2] There were 518 cases in the five groups into which the operations of this order were subdivided; the result was not ascertained in 3 instances. See Tables XXI to XXV inclusive, and Tables XXXI and XXXII. In the five groups, the fatality was distributed as follows: In the true excisions at the shoulder, in which portions of the scapula or clavicle were removed with the upper extremity of the humerus, there were but 2 deaths in 19 operations, or 10.5 per cent.; the partial primary excisions of the head were successful. Of 175 decapitations, 56 were fatal, or 32 per cent.; in 293 primary excisions of the head and portions of the shaft, the mortality rate was 27.3; in 25 primary cases in which the extent of exsected bone was not specified, the fatality reached the formidable ratio of 88 per cent.

[3] A slight deviation was made, in tabulating the excisions, from the practice heretofore pursued by the editor in former publications in regard to the classification of amputations. Excisions practised on the day of injury, on the next day, *and also on the third day*, were rated as primary, whereas primary amputations were limited to those done within 48 hours from the reception of the injury. The distinction was made because the stage of reaction appeared to be longer delayed in the cases selected for excision than in the graver instances of injury demanding the ablation of the limb. In the four subordinate groups of intermediary operations the mortality rates were: For 11 shoulder joint incisions, 54.5; three partial excisions of the head without fatality; 55 decapitations, 61.8; for 155 excisions of head and portions of shaft, 41.3 per cent. These cases were likewise subdivided into four groups. The excisions of head with portions of clavicle or scapula had a mortality of 20; all 6 of the partial excisions were successful; 26 decapitations gave a fatality of 50; in 30 secondary operations of unknown extent, the ratio of mortality was 24 per cent.

secondary operations were also determined in every instance, and furnished a ratio of mortality of 29.3. Uniting the two groups of cases of consecutive operations, the mortality-rate was 41.4, instead of 38.5, per cent. as computed in Circular 6, from a series of cases numerically inferior to the present by almost one-third, and comprising nearly 12 per cent. of cases with unknown results. Of fifty-one excisions after shot fracture at the shoulder, enumerated in the foregoing table, some of the essential dates could not be ascertained,[1] although the final results were verified in forty-five cases, the latter series giving a ratio of mortality of 31.1 per cent.

Grouping the eight hundred and seventy-six excisions in which the results as to fatality were established,—for this point was determined in all save nine of the eight hundred and eighty-five operations,—the aggregate mortality was three hundred and five, or 34.8 per cent.[2] in the eight hundred and seventy-six determined cases. Even assuming that these nine cases all terminated fatally, the general numerical result would be but very slightly modified.

A more exhaustive analysis of these cases would be instructive, and, indeed, imperative, could it be accomplished without excluding the consideration of other kindred topics of equal importance. It would be interesting to inquire, for example, into the causes of a greater mortality after primary decapitations of the humerus after shot injury, than in excisions involving portions of the shaft as well as the head of the bone; and many similar questions might be profitably examined if there was space for their discussion.

It cannot be denied that the foregoing statistics give a very extended view of the merits of the operation of excision at the shoulder after shot injury, as compared with expectant treatment and with ablation at the joint, yet they do not comprise all the information on the subject that has been accumulated.

In addition to the foregoing examples which occurred either to Union soldiers or to Confederate soldiers treated in Union hospitals, the editor has been enabled to consult the record of a large number of Confederate cases, compiled by Dr. Howell L. Thomas, of Richmond, who, with great kindness, has contributed the register containing these observations to the archives of the Office of the Surgeon-General of the Army, at Washington. Access to many of the larger military hospitals of the Confederacy, and to the files of the Surgeon-General's Office, at Richmond, afforded Dr. Thomas unusual facilities for accumulating these data, yet he regretfully records, as quoted in a preceding volume of this work (PART I, VOL. 2, page 456, *Note* 2), the manifold imperfections of the reports, and meagreness of the record.[3] It is impracticable, from the facts detailed in these returns, to segregate, to any large extent, the primary and consecutive operations; and, in nearly half of the cases, the results are left to conjecture. Under these circumstances, it has been deemed inexpedient to attempt to group this series with those derived mainly from the reports of the Union surgeons. The total number of cases of excisions at the shoulder for shot fracture, recorded by Dr. Thomas, is two hundred and seventy-four; but seventy-three of these refer to cases treated at Union hospitals, and have been included in the preceding

[1] In most of these cases the dates either of the injury or of the operation were specified, one or the other being omitted, thus rendering it impracticable to determine the interval between the two. The single operation in this category involving the scapula was successful; 1 of the 2 partial excisions was fatal; 16 determined decapitations had a death-rate of 25 per cent.; 19 excisions of the upper extremity of the humerus had a mortality-rate of 10.5; the 7 determined cases in which the parts of bone removed were unspecified, all proved fatal.

[2] The mortality was distributed, in the five subdivisions, as follows: Excisions of head or head and shaft, with parts of clavicle or scapula, 40 determined cases, death-rate 24.3; in 14 partial excisions there was but 1 fatal case, or 7.14 per cent.; 272 decapitations gave a death-rate of 39.33; 517 excisions of head with upper part of shaft had a death-rate of 30.56; and 32 excisions of unspecified parts of the shoulder joint had a mortality of 90.6 per cent.

[3] "Brevity is a very commendable feature in clinical reports," says Dr. THOMAS; but conciseness must not be insisted on at the expense of completeness, else the cases may be robbed of all interest and the greater part of their value.

tabular statements.[1] There remain two hundred and one cases, of which the results have been definitely traced in seventy-five, a group including forty-three fatal cases and thirty-two recoveries. Twenty-three cases are returned as "furloughed," and probably a large proportion of these eventually survived, although some very grave cases were allowed to leave the hospitals for treatment at home. In one hundred and three cases, no satisfactory account of the results of the operations is afforded; hence it is not feasible to estimate the ratio of mortality in this interesting series. It is unnecessary to recapitulate the seventy-three instances already tabulated; they presented a very favorable percentage of recoveries. Of the remainder, a descriptive tabular statement is appended:

TABLE XL.

Summary of Two Hundred and One Cases of Excision at the Shoulder, after Shot Injury, practised in the Confederate Army.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REPORTER.
1	*Ahrens, H.*, Pt., I, 1st Arkansas, age 35.	July 21, 1864.	Shot through the head of right humerus.	July 21, 1864.	Head excised	Surgeon S. T. Turner, 6th and 7th Arkansas.
2	*Alexander, M. B.*, Pt., A, 5th Tennessee, age 25.	July 8, 1861.	Fracture of the right humerus at surgical neck.	July 8, 1864.	Shoulder joint excised	Surgeon J. M. Brannock, C. S. A.
3	*Allen, A. A.*, Pt., D, 8th Georgia.	Oct. 7, 1864.	Wound in left shoulder joint	Oct. 8, 1864.		Died November 19, 1864. Surg. P. F. Browne, C. S. A.
4	*Allen, R.D.*, Pt., C, Ashcraft's command.	July 7, 1864.	Wound of left shoulder joint	July 7, 1864.	Lisfranc's method	Surgeon J. Button, C. S. A.
5	*Allison, C. E. L.*, Lieut., A, 6th Florida.	Sept. 20, 1863.	Wound of shoulder joint	1863.	Head of humerus excised	Secondary hæmorrhage Nov. 1st; necrosis; recovered. Surg. F. Hawthorne, C. S. A.
6	*Anderson, A. C.*, Sergt., G, 7th Texas, age 26.	July 22, 1864.	Comp'd comminuted fracture of head and shaft.	July 22, 1864.	Head and four inches of shaft excised.	Asst. Surg. D. T. Richardson, C. S. A.
7	*Autry, D.*, Pt., I, 51st North Carolina, age 30.	May 20, 1864.	Fracture of head of humerus	May 22, 1864.	Five inches of bone, including head, excised.	May 31st, doing well. Surgeon J. H. Pottinger, C. S. A.
8	*Appleberry, F.*, Pt., C, 51st Tennessee.	July 22, 1864.	Fracture of upper portion of right humerus.	1864.	Head and neck and upper eighth, through longitudinal incision.	Doing well. Surg. L. C. Pynchon, C. S. A.
9	*Arrington, J. W.*, Pt., I, 12th North Carolina, age 20.	May 10, 1864.	Shot fracture of the head of the humerus.	May 10, 1864.	Excision of the head and two and a half inches of shaft.	May 20th, secondary hæmorrhage. Surg. R. J. Hicks, 23d North Carolina.
10	Asbell, W., Pt., C, 1st Delaware.	May 6, 1864.	Musket ball fractured head of humerus and second rib.	May 22, 1864.	Head excised through straight incision.	Died May 22, 1864. Surg. R. A. Lewis, C. S. A.
11	*Beam, B. M.*, Pt., H, 33d Virginia, age 19.	May 3, 1863.	Shot wound through the upper third of humerus.	May 3, 1863.	Head excised	Surg. S. D. Smith, C. S. A.
12	*Bean, T. J.*, Lieut., K, 16th Mississippi.	1864.	Shot wound of left shoulder joint.	1864.	Excision of shoulder joint	October 16th, transferred. Surg. S. E. Chaille, C. S. A.
13	*Beardin, W. P.*, Pt., C, 44th Georgia, age 23.	May 6, 1864.	Shot fracture of head of the humerus.	May 6, 1864.	Excision of head; secondary hemorrhage June 1; amputation at the shoulder joint.	June 30th, nearly healed. Confederate Surgeon Cabell.
14	*Bell, E.*, Pt., H, 21st North Carolina, age 37.	June 7, 1864.	Wound of right shoulder; ball lodged in the bone.	June 7, 1864.	Excision of shoulder joint	August, 1864, recovered. Asst. Surg. R. O'Leary, C. S. A.
15	*Belter, S. H.*, Pt., G, 5th Texas, age 30.	May 5, 1864.	Shot fracture of right humerus.	May 5, 1864.	Removal of the head and three inches of shaft.	July 29, 1864, furloughed. Asst. Surg. H. C. Chalmers, C. S. A.
16	*Blackwell, G.*, Pt., C, 57th North Carolina, age 25.	May 5, 1863.	Head of humerus split by a conoidal ball.	May 5, 1863.	Removal of head and neck thro' straight incision into deltoid.	Died. Surg. C. S. Morton, 57th North Carolina.
17	*Blevins, S.*, Pt., G, 30th North Carolina, age 17.	June 3, 1864.	Shot wound of the left shoulder joint.	June 3, 1864.	Excision of the head and upper third.	Retired March 31, 1865. Surg. O. F. Manson, C. S. A.
18	*Bostick, J. L.*, Lieut., 19th Arkansas, age 35.	July 22, 1864.	Shot fracture of right humerus and wound of posterior portion of chest.	July 23, 1864.	Head and superior third excised.	Died, July 31, 1864, from internal hæmorrhage. Surgeon W. E. Brickell, C. S. A.
19	*Bowlin, S. C.*, Pt., Corbett's Battery, age 29.	May 15, 1864.	Comp'd comminuted fracture of head of the left humerus; grapeshot wound of thigh.	May 16, 1864.	Head and three inches of shaft excised.	Died June 8, 1864. Surg. G. G. Crawford, C. S. A.
20	*Boyd, J. B.*, Lieut., E, 9th Tennessee, age 27.	1864.	Shot fracture of right shoulder.	Primary	Shoulder excised	February 3, 1864, nearly well. Surgeon D. Dupré.
21	*Brandon, C. C.*, Pt., K, 13th Mississippi.	July 1, 1862.		Primary	Shoulder joint excised	Died July 15, 1862. Surg. G. W. Carrington, C. S. A.
22	*Brantley, J. M.*, Pt., A, 48th North Carolina, age 22.	Aug. 25, 1864.	Head of the left humerus and spinous process of the lumbar vertebra.	Sept. 18, 1864.	Head excised through straight incision.	Furloughed Oct. 8, 1864. Surg. F. Foulkes, C. S. A.
23	*Breeden, J. H.*, I, 59th Virginia, age 18.	Aug. 28, 1864.	Fracture of the head of left humerus.	Aug. 28, 1864.	Head excised	Surgeon R. S. J. Peebles, C. S. A.
24	*Brown, J. R.*, Sergt., Wyatt's Artillery, age 22.	June 3, 1864.	Through head of the right humerus.	On field	Head and four inches of shaft	July 30, 1864, doing well. Surg. E. M. Seabrook, C. S. A.
25	*Broox, J. A.*, Pt., F, 3d Georgia, age 28.	May 6, 1864.	Wound of shoulder joint	May 6, 1864.	Shoulder joint excised	Doing well. Surg. W. F. Shine, 3d Georgia S. S.
26	*Bunks, F. M.*, Pt., K, 13th Arkansas, age 20.	Aug. 31, 1864.	Head of humerus	Sept. 7, 1864.	Head and two inches of shaft excised.	Transferred Sept. 17, 1864. Surg. S. E. Chaille, C. S. A.
27	*Bush, J. P.*, Sergt., B, 2d Georgia, age 19.	July 20, 1861.	Fracture of head of humerus	July 20, 1861.	Head excised	Surgeon W. H. Doughty, 2d Georgia.

[1] These seventy-three cases may be referred to as follows: Two in TABLE XXII; sixteen in TABLE XXIV; four in TABLE XXV; one in TABLE XXVI; two in TABLE XXVII; two in TABLE XXX; twenty-five in TABLE XXXI; eleven in TABLE XXXII; four in TABLE XXXIII; two in TABLE XXXV; one in TABLE XXXVI; one in TABLE XXXVII; two in TABLE XXXVIII.

28	*Campbell, J. W.*, Pt., E, 48th Virginia.	Aug. 9, 1862.	Right humerus fractured within and external to shoulder joint.	Aug. 20, 1862.	Two and a half inches, including head, by Surg. W. Hay, C. S. A.	December 16, 1862, considerable motion of limb.
29	*Carpenter, J W.*, Pt., I, 24th South Carolina, age 21.	May 16, 1864.	Shot wound of shoulder joint..	1864.	Head of bone excised.....	Surg. W. G. McKenzie, C. S. A.
30	*Carr, E. T.*, Pt., F, 20th North Carolina, age 39.	May 9, 1864.	Shot wound of shoulder joint..	May 9, 1864.	Shoulder joint excised.....	Died May 16, 1864. Surg. J. A. Bizzell, C. S. A.
31	*Carroll, T. H*, 27th Georgia.	June 27, 1862.	Shot fracture of upper part of humerus.	June 29, 1862.	Excision of the head.....	Recovered. Surg. J. A. S. Milligan, C. S. A.
32	*Champion, G. W.*, Pt., C, 2d Mississippi, age 23.	May 6, 1864.	Shot wound of shoulder joint..	1864.	Head and three inches of shaft removed.	Died, June 25, 1864, from erysipelas. Surg. J. R. Page, C. S. A.
33	*Clark, J. A.*, —— ——	July 1, 1862.	Shot wound of shoulder.....	July 1, 1862.	Excision of shoulder joint.....	Recovered. Surg. J. M. Halloway, C. S. A.
34	*Clemens, E. M.*, Sergeant, A, 12th Georgia, age 34.	June 14, 1864.	Humerus fractured extensively by shot.	June 14, 1864.	Head and neck and four inches of shaft removed.	July 18, 1864, furloughed. Surg. E. H. Smith, C. S. A.
35	*Clements, J. L.*, Pt., K, 6th South Carolina, age 24.	June 12, 1864.	Ball lodged in anatomical neck, splitting and comminuting surgical neck.	June 16, 1864.	Head and two inches of shaft removed.	October 26, 1864, furloughed; motion of hand and forearm perfect. Surg. J. L. Cabell, C. S. A.
36	*Cowdray, A.*, Pt., A, 30th Louisiana, age 34.	Aug. 7, 1864.	Shot fracture of right humerus	Aug. 7, 1864.	Excision of the shoulder joint..	October 30th, improving. Surg. A. H. Snead, C. S. A.
37	*Creamer, J. W.*, Pt., F, 12th Georgia, age 25.	May 10, 1864.	Fracture of head of humerus; two inches of bone on anterior surface broken off.	May 11, 1864.	Broken fragments removed by resection.	.. ..
38	*Dalton, J. W.*, Pt., G, 54th Virginia, age 35.	May 15, 1864.	Shot fracture of the head of left humerus.	May 16, 1864.	Head and three inches of shaft removed.	Secondary hæmorrhage; died May 28, 1864. Surg. G. G. Crawford, C. S. A.
39	*Darden, E.*, Pt., F, 8th Louisiana, age 19.	May 4, 1863.	Head of right humerus and portion of glenoid cavity.	May 5, 1863.	Head and humerus, and portion of cavity.	Surgeon J. H. K. Monmonier, C. S. A.
40	*Davis, H. C.*, Pt., B, 37th Alabama, age 39.	June 18, 1864.	Head of the right humerus, by minié ball.	June 18, 1864.	Two and a half inches, including head, excised.	Furloughed in July, 1864. Surg. S. E. Chaillé, C. S. A.
41	*Davis, J. S.*, Pt., F, 2d South Carolina, age 28.	Oct. 19, 1864.	Wound of shoulder joint.....	Oct. 19, 1864.	Shoulder joint excised.....	December 1st, doing well. Surg. A. R. Menn, C. S. A.
42	*Dees, R.*, Pt., E, 5th Alabama, age 31.	Sept. 19, 1864.	Ball split head of right humerus and chipped off portion of the glenoid cavity.	Sept. 28, 1864.	Head excised through surgical neck.	Doing well October 1, 1864. Surg. J. H. Murray, C. S. A.
43	*Dennis, J. M.*, Corporal, B, 4th Alabama.	June –, 1864.	Comminuted fracture of the left shoulder joint within capsule.	1864.	Three inches of bone from articulation.	Surgeon A. R. Erstine.
44	*Dougherty, J.*, Pt., D, 8th Louisiana, age 28.	Sept. 14, 1863.	Fracture of head of the left humerus; ball penetrated chest.	Sept. 14, 1863.	Portion of anatomical neck.....	Surgeon J. H. K. Monmonier, 8th Louisiana.
45	*Doyle, T.*, Pt., E, 2d Tennessee.	April 6, 1862.	Wound of left shoulder joint, followed by anchylosis.	Feb. 15, 1863.	Head of humerus excised.....	Returned to duty May 4, 1863. Surgeon P. F. Eve, C. S. A.
46	*Draper, L.*, Pt., B, 5th North Carolina.	July 1, 1863.	Head of humerus fractured....	On field	Head excised through straight incision through deltoid.	Surgeon R. J. Hicks, 23d North Carolina.
47	*Dutton, S. D.*, Pt., E, 20th Alabama, age 24.	Aug. 4, 1864.	Fracture of head of the right humerus.	Aug. 4, 1864.	Head, through straight incision.	Surgeon W. E. Cochran, C. S. A.
48	*Earnheart, T.*, Pt., Ramsey's Artillery, age 19.	June 23, 1864.	Head of right humerus fractured; joint involved.	Primary	Three and a half inches of bone.	Furloughed July 30, 1864. Surg. J. S. Brint, C. S. A.
49	*Edens, Z. P.*, Pt., G, 19th Arkansas, age 30.	Sept. 20, 1863.	Shot fracture of upper portion of right humerus.	Mar. 9, 1864.	Head and two inches of shaft removed.	Died March 29, 1864; erysipelas. Surg. G. G. Crawford, C. S. A.
50	*Edwards, J. A.*, Pt., A, 21st Georgia.	May 3, 1863.	Shot fracture of humerus, involving head of bone.	May 3, 1863.	Four inches of upper extremity removed by posterior external flap. (Lisfranc.)	Surg. L. G. Capers, C. S. A.
51	*Ellis, A. M.*, Pt., E, 1st Georgia, age 16.	June 15, 1864.	Musket ball chipped off head of right humerus and articular facet of scapula and lodged in joint.	June 15, 1864.	Head excised through linear incision.	Hæmorrhage from circumflex artery. Surgeon H. M. Darling, Stovell's Brigade.
52	*Ellison, A.*, Pt., D, 37th Mississippi, age 30.	July 22, 1864.	Shot fracture of head and two inches of right humerus.	July 22, 1864.	Removal of four inches of bone.	August 1st, doing well. Surgeon M. H. Nash, C. S. A.
53	*Erwin, W. B.*, Lieut., C, 9th Tennessee, age 28.	July 30, 1864.	Shot wound of head of right humerus.	July 30, 1864.	Head and three inches of bone removed through linear incision.	Gangrene; Sept. 30, 1864, not doing well. Surg. A. H. Snead, C. S. A.
54	*Farr, J. F.*, Lieut., H, 5th South Carolina.	May 10, 1863.	Ball passed thro' shoulder joint, fracturing head of humerus.	May 10, 1864.	Excision of head and one inch of shaft by White's method.	July 10, 1864, doing well. Surg. M. Bellinger, C. S. A.
55	*Fitzgerald, T. W.*, Capt., K, 12th Alabama.	May 3, 1863.	Fracture of right humerus at anatomical neck, extending into joint, by grapeshot.	May 13, 1863.	Head excised through straight incision; posterior circumflex ligated.	Typhoid symptoms; died May 16, 1863. A. A. Surg. E. H. Wood, C. S. A.
56	*Foltz, H. J.*, Pt., D, 7th Virginia Cavalry, age 34.	May 6, 1864.	Shot fracture of upper portion of left humerus.	1864.	Primary excision of head and three and a half inches of shaft.	July 16th, furloughed. Asst. Surg. F. B. Shuford, C. S. A.
57	*Fordhave, Z.*, Pt., F, 2d Georgia, age 40.	June 22, 1864.	Shot fracture of head of the humerus.	June 22, 1864.	Excision of head.....	Surg. J. M. Douglas, 2d Georgia.
58	*Frizzle, M. C.*, Corp., H, 19th Arkansas, age 22.	June 20, 186–.	Wound through right shoulder joint; fracture of head of bone.	June 20, 186–.	Head removed through single vertical incision.	Doing well August 1st. Surg. W. E. Bickell, 19th Arkansas.
59	*Fuller, W.*, Pt., D, 34th Georgia, age 26.	June 22, 1864.	Fracture of head of humerus..	June 22, 1864.	Head excised.....	Surg. W. E. Brock, 34th Georgia.
60	*Gabbert, J. M.*, Sergt., D, 5th Virginia, age 25.	Aug. 9, 1862.	Head and shaft of the right humerus fractured; erysipelas and diarrhœa.	Sept. 21, 1862.	Head and two inches of shaft..	Arm amputated; died next day. Surg. J. L. Cabell, C. S. A.
61	*Gardee, P.*, Pt., 43d North Carolina, age 19.	July 1, 1863.	Head of right humerus penetrated.	July –, 1863.	Head and surgical neck through V-shaped incision.	Died, July 26, 1863, from secondary hæmorrhage. Surg. J. L. Cabell, C. S. A.
62	*Garner, F. W.*, Pt., G, 5th Georgia, age 48.	Nov. 23, 1864.	Head of the humerus fractured; flesh wound of elbow.	Nov. 24, 1864.	Head excised through linear incision.	Erysipelas. Surg. D. Herndon, C. S. A.
63	*Gay, J.*, Corporal, H, 14th Georgia, age 30.	May 23, 1864.	Head and shaft of the humerus fractured.	May 24, 1864.	Head and three inches of shaft through V-shaped incision.	Surgeon F. B. Henderson, 14th Georgia.
64	*Gay, M.*, Sergeant, H, 50th Georgia.	May 6, 1864.	Head of humerus fractured....	May 6, 1864.	Head excised.....	Surgeon H. J. Parramore, 50th Georgia.
65	*Glenn, J. S. C.*, Sergt., K, 45th Alabama, age 40.	July 22, 1864.	Left humerus fractured.....	July 23, 1864.	Head and two and a half inches of shaft excised.	August 31st, doing well. Surg. C. L. Herbert, C. S. A.
66	*Goff, M.*, Pt., G, 17th Alabama, age 30.	July 28, 1864.	Fracture of head and anatomical neck of left humerus.	July 28, 1864.	Head and neck through straight incision, posteriorly.	Died August 14, 1864. Surgeon S. Y. D. Hill, C. S. A.
67	*Gordon, J. V.*, Pt., D, 16th Georgia, age 21.	Nov. 29, 1863.	Wound of right shoulder joint.	Nov. 29, 1863.	Resection.....	Asst. Surg. J. B. Clifton, C. S. A.
68	*Grader, J.*, Pt., E, 16th South Carolina, age 38.	July 22, 1864.	Right humerus fractured at the neck.	July 23, 1864.	Head excised.....	Surg. W. H. Cooper, 16th South Carolina.
69	*Graham, F. D.*, Sergt., K, 26th South Carolina, age 25.	May 20, 1864.	Upper third of the left humerus fractured.	May 21, 1864.	Head and four inches of shaft excised.	June 2d, secondary hæmorrhage. Surg. A. G. Lane, C. S. A.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Reporter.
70	*Gray, A. K.*, Pt., K, 21st Mississippi, age 26.	May 6, 1864.	Ball passed through surgical neck.	May 7, 1864.	Upper three inches of bone excised.	Died May 12, 1864. Surg. G. H. Peets, 21st Mississippi.
71	*Gray, J. F.*, Pt., G, 3d Arkansas, age 26.	May 6, 1864.	Wound of left shoulder joint...	May 7, 1864.	Head excised through a V-shaped incision.	Furloughed July 28, 1864. Surg. B. M. Lebby, C. S. A.
72	*Green, C. R.*, Pt., K, 32d Georgia, age 20.	Feb. 20, 1864.	Shot in head of left humerus..	Mar. 4, 1864.	Head excised.....	Died March 17, 1864. Surgeon J. S. Morel, C. S. A.
73	*Green, P.*, Lieut., E, 16th Tennessee, age 28.	July 20, 1864.	Comp'd comminuted fracture of upper third of humerus.	July 20, 1864.	Head through straight incision through deltoid.	November 1st, doing well. Surg. T. W. Leak, 16th Tennessee.
74	*Green, P.*, Pt., B, 25th Texas, age 28.	May 27, 1864.	Fracture of humerus, head and neck of scapula.	186–.	Head of humerus and head and neck of scapula.	Surgeon A. A. Lawrence, 25th Texas.
75	Green, P., Pt., 1st Ohio Battery, age 27.	May 28, 1864.	Compound fracture of right humerus, high up.	May 29, 1864.	Upper two-thirds, including the head.	Died July 5, 1864. Asst. Surg. G. G. Roy, C. S. A.
76	*Griffith, R. W.*, Pt., B, 45th Georgia, age 35.	May 3, 1863.	Upper third of humerus fractured.	On field	Head through straight incision through deltoid.	Erysipelas; died of pyæmia, June 1, 1863. Surgeon J. Chambliss, P. A. C. S.
77	*Haire, J. C.*, Sergt., D, 17th Georgia, age 26.	Sept. 19, 1863.	Fracture of head of humerus..	Oct. 9, 1863.	Four inches of bone, including head, removed.	Doing well. Surg. S. E. Chaillé, C. S. A.
78	*Hall, T. M.*, Sergt., A, 37th Mississippi, age 30.	July 28, 1864.	Wound in right shoulder joint	July 28, 1864.	Head of humerus excised.....	Died. Surg. J. A. Groves, C. S. A.
79	*Hankins, J. C.*, Pt., B, 38th Virginia, age 21.	May 16, 1864.	Shot fracture of surgical neck of right humerus.	May 17, 1864.	Head and five inches of shaft removed through perpendicular incision through deltoid.	Died from exhausting suppuration. Surg. S. E. Habersham, C. S. A.
80	*Hart, J.*, Pt., E, 63d Virginia, age 67.	Sept. 20, 1863.	Ball completely crushed head of humerus.	Oct. 16, 1863.	Two inches of bone removed...	Jan. 1, 1864, complete recovery. Asst. Surg. T. J. McFarland, C. S. A.
81	*Head, W. S.*, Pt., I, 17th Alabama, age 35.	Sept. 8, 1863.	Shot wound of left shoulder....	Sept. 8, 1863.	Head of humerus removed, together with fragments of bone.	Nearly well, and promises to have a useful arm. Surgeon D. L. Darden, C. S. A.
82	*Heywood, T. F.*, Pt., F, 44th North Carolina, age 33.	Oct. 14, 1863.	Neck of right humerus badly broken by shot.	Oct. 20, 1863.	Removal of the head through a V-shaped incision.	Furloughed Dec. 11, 1863, nearly well. Surg. J. L. Cabell, C. S. A.
83	*Hill, W. G.*, Lieut., I, 28th Alabama, age 28.	July 28, 1864.	Shot wound of shoulder, involving head of humerus.	July 28, 1864.	Removal of head thro' straight incision.	Asst. Surg. J. W. Graham, 28th Alabama.
84	*Hobard, J. H.*, Capt., Humphrey's Brigade, age 30.	May 6, 1864.	Shot wound of shoulder.....	May 6, 1864.	Resection of head of humerus..	May 31st, improving.
85	*Hogwood, A.*, Pt., G, 41st Virginia, age 28.	May 6, 1864.	Shot wound of the shoulder and hand.	May 7, 1864.	Head of humerus excised.....	June 30th, nearly healed; perfect use of forearm. Surgeon P. B. Baker, 41st Virginia.
86	*Holton, A. J.*, Sergt., A, 6th Alabama, age 24.	May 2, 1863.	Shot fracture of head of right humerus.	On field	Head excised	Died, July 27, 1863, of exhaustion. Surg. C. J. Clark, C. S. A.
87	*Horn, J. A.*, Pt., B, 19th South Carolina, age 21.	July 22, 1864.	Shot wound involving shoulder joint.	July 22, 1864.	Removal of injured head thro' straight incision.	Furloughed Sept. 28, 1864. Surgeon W. H. Rankins, 19th South Carolina.
88	*House, E. G.*, Pt., C, Cobb's Legion, age 19.	May 23, 1864.	Shot fracture of head of the humerus.	May 23, 1864.	Head excised at surgical neck.	Asst. Surg. H. S. Bradley, Cobb's Legion.
89	*Howell, W.*, Pt., H, 15th South Carolina, age 37.	June 24, 1864.	Comp'd comminuted fracture of humerus and scapula.	June 24, 1864.	Head of humerus and spinulæ of scapula.	Doing well; "have some fear of necrosis of scapula." Surg. J. A. James, 15th South Carolina.
90	*Hudson, B. F.*, Sergt., A, 4th Florida, age 28.	Sept. 20, 1863.	Fracture of head of the left humerus.	Sept. 25, 1863.	Head excised	Died November 29, 1863. Surg. C. E. Michel, C. S. A.
91	*Hudson, L.*, Lieut., K, 19th Alabama, age 36.	July 22, 1864.	Fracture of head of humerus..	July 23, 1864.	Head excised	August 31st, doing well. Surg. C. Foxey, 19th Alabama.
92	*Huff, J. T.*, Sergt., H, 53d Georgia, age 27.	July 21, 1864.	Wound through shoulder joint	June 21, 1864.	Joint resected	Died August 9, 1864.
93	*Jenkins, J. A.*, Lieut., C, 51st Tennessee, age 39.	July 20, 1864.	Comminuted fracture of head and neck of right humerus.	July 20, 1864.	Head and surgical neck excised thro' straight incision.	August 1st, doing well. Surg. S. V. D. Hill, C. S. A.
94	*Johnston, H. H.*, Sergt., B, 7th Texas.	Sept. 19, 1863.	Wound of right shoulder joint.	Oct. 14, 1863.	Head through perpendicular incision through deltoid.	Died Oct. 31, 1863, of pyæmia. Surg. W. P. Harden, C. S. A.
95	Jones, J., Pt., B, 121st New York, age 28.	May 10, 1864.	Fracture of head and surgical neck of humerus.	June 30, 1864.	Excision of four inches of bone.	July 1st, condition not good. Surgeon H. C. Chalmers, C. S. A.
96	*Johns, J. B.*, Pt., C, 18th Tennessee.	May 26, 1864.	Compound fracture of humerus.	May 26, 1864.	Head and six inches of shaft excised.	August 31st, doing well. Surg. J. F. Grant, C. S. A.
97	*Johnson, W. A.*, Pt., I, 44th Georgia, age 24.	May 10, 1864.	Ball passed through head of humerus, split bone for three inches, and shattered glenoid cavity.	June 29, 1864.	Three inches of humerus and detached fragments of scapula.	July 31st, pretty good use of arm. Surg. J. L. Cabell, C. S. A.
98	Kearns, P. J., Corporal, F, 114th Illinois, age 33.	July 14, 1864.	.....	July 14, 1864.	Shoulder joint excised.....	Died of pyæmia, Aug. 9, 1864. Surg. W. C. Cavenaugh, C. S. A.
99	*Key, D. L.*, Pt., D, 25th Arkansas, age 25.	June 28, 186–.	Shot fracture of left humerus..	186–.	Primary excision of shoulder joint and upper third of the shaft.	Asst. Surg. A. M. Walls, 25th Arkansas.
100	*Kidd, C. H.*.....	.....	Shot fracture of head of the humerus.	.....	Head removed	.....
101	*King, E. T.*, Pt., I, 47th Tennessee, age 22.	July 20, 1864.	Comp'd comminuted fracture of head and surgical neck of right humerus by conoidal ball.	July 20, 1864.	Head and neck removed thro' a straight incision posteriorly.	Recovered. Surg. S. V. D. Hill, C. S. A.
102	*Kinsey, E. T.*, Sergt., B, 3d Mississippi, age 40.	July 20, 1864.	Head of the humerus badly fractured by shot; tissues lacerated.	July 25, 1864.	Head and upper third of shaft removed by vertical incision through centre of deltoid.	Sept. 11th, doing well. Surgeon W. T. McAllister, C. S. A.
103	*Knight, W.*, Pt., C, 28th Tennessee, age 38.	July 7, 1864.	Compound shot fracture of the head of right humerus.	July 8, 1864.	Head removed through straight incision.	Oct. 31st, doing well. Surg. C. R. Wilson, 28th Tennessee.
104	*Lawson, J.*, Pt., A, Palmetto Sharpshooters, age 16.	May 10, 1864.	Shot wound implicating shoulder joint.	May 10, 1864.	Excision of shoulder joint by straight incision thro' deltoid.	June 1st, doing well; furloughed June 6, 1864. Surgeon A. G. Lane, C. S. A.
105	*Lee, G. W.*, Pt., H, 29th Alabama, age 27.	July 22, 1864.	Comp'd comminuted shot fracture of head of right humerus.	July 26, 1864.	Head and four inches of shaft excised.	August 1st, doing well; Sept. 5, 1864, furloughed. Surg. G. G. Crawford, C. S. A.
106	*Leslie, J.*, Pt., B, 14th Georgia, age 18.	May 3, 1863.	Musket ball lodged in head of humerus.	On field	Head and one and a half inches of shaft removed thro' straight incision.	May 9th, doing well; healthy granulations. Surg. J. Chambliss, C. S. A.
107	*Libbett, G. W.*, Pt., C, 35th North Carolina, age 19.	May 19, 1864.	Shot fracture of the humerus near shoulder.	June 1, 1864.	Head excised through straight incision.	Recovered. Surg. A. G. Lane, C. S. A.
108	*Long, H.*, Lieutenant, B, 6th Louisiana, age 28.	Sept. 19, 1864.	Compound shot fracture of right humerus near surgical neck.	On field	Head and two inches of shaft removed thro' vertical incision.	February 1, 1865, recovering; arm rapidly improving.
109	*Long, W.*, Pt., C, 13th Georgia, age 22.	Sept. 19, 1864.	Fracture of head of the right humerus.	Sept. 29, 1864.	Shoulder joint excised.....	October 30th, can use arm without trouble; furloughed Nov. 30, 1864. Surg. T. H. Fisher, C. S. A.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Reporter.
189	*Waring, M. H.*, Sergt., G, 3d Florida.	May 28.	Shot fracture of head of right humerus.	May 29.	Head removed.....	Surgeon J. T. Holden, C. S. A.
190	*Waterman, P.*, Pt., D, 20th North Carolina.	Sept. 14, 1862.	Shot comminution of head of humerus.	Sept. 14, 1862.	Three inches of upper extremity of humerus removed.	Surgeon R. J. Hicks, C. S. A.
191	*Webb, H.*, Pt., E, 4th Mississippi, age 34.	July 9, 1864.	Fracture of head of right humerus and scapula by a minié ball.	On field	Head of humerus and fractured portion of scapula removed.	Doing well. Aug. 1st, still in hospital. Surgeon C. A. Rice, 4th Mississippi.
192	*Westwood, W.*, Pt., Carter's Artillery, age 28.	Sept. 14, 1863.	Extensive comminution of upper part of left humerus.	Sept. 15, 1863.	Portion of head through a curvilinear incision from coracoid to insertion of deltoid.	Sept. 27th, hæmorrhage. February, 1864, recovered. Surgeon B. F. Browne, C. S. A.
193	*Whaley, I.*, Corp'l, H, 54th Alabama.	July 28, 1864.	Comminuted fracture of right humerus, splitting head from lesser tuberosity upward; fracture and comminution of the scapula one and a half inches above inferior angle.	1864.	Head and three inches of shaft and spiculæ removed.	Aug. 11th, hæmorrhage from deltoid branch. Aug. 12th, vessel ligated. Aug. 29th, prognosis favorable. Surgeon P. H. Otey, C. S. A.
194	*White, A. L.*, Pt., I, 7th Georgia, age 22.	Oct. 7, 1864.	Shot wound of right shoulder joint.	Oct. 8, 1864.	Excision of shoulder joint.....	Dec. 30, 1864, still in hospital. Surg. B. F. Browne, C. S. A.
195	*White, J. W.*, Lieut., I, 14th Alabama.	May 6, 1864.	Shot wound of shoulder joint..	May 6, 1864.	Excision of the head.....	Furloughed June 2, 1864.
196	*Williams, G. W.*, Pt., G, 10th Texas, age 27.	May 27, 1864.	Comp'd shot fracture of right humerus involv'g shoulder joint.	1864.	Excision of head and four inches of shaft.	Ass't Surg. T. C. Foster, 10th Texas.
197	*Williams, J. W.*, Pt., B, 19th Mississippi, age 24.	April 5, 1862.	Shot fracture of neck of the humerus; necrosis.	Feb. 18, 1863.	Thirteen pieces of bone with the articular head removed.	Duty. March 16, 1863, wound entirely healed. "Thinks he will ultimately regain the entire use of arm." Surg. J. Chambliss, C. S. A.
198	*Wilson, E. T.*, Pt., A, 6th Texas, age 28.	May 27, 1864.	Shot fracture of surgical neck of humerus.	May 28, 1864.	Head and portion of shaft removed; two small muscular arteries divided and ligated.	May 30th, doing well. Assistant Surg. R. A. Smith, 6th Texas.
199	*Wilson, J. H.*.....	186–.	Fracture of head of humerus...	Sec'd'y	Head excised	Recovered.
200	*Workman, W. J.*, Pt., G, 44th North Carolina, age 21.	June 1, 1864.	Wound through shoulder joint antero-posteriorly.	June 2, 1864.	Shoulder joint excised.....	Furloughed July 26, 1864. Surgeon R. A. Lewis, C. S. A.
201	*Youngblood, C. S.*, Pt., H, 2d Louisiana.	May 3, 1863.	Fracture of upper third of right humerus.	On field	Head excised	Died May 10, 1863. Surgeon J. A. Milligan, C. S. A.

The two hundred and one operations above enumerated may be summed up as one hundred and thirty-four primary, twenty-eight intermediary, and ten secondary excisions at the shoulder for shot injury, together with twenty-nine cases of the same subdivision, although of uncertain date. The undetermined results are in large proportion, as the cases appear in the tabulation;[1] but many of the reports, especially those of the field cases, indicate that the patients were "doing well" when last accounted for; and the series tends to corroborate the evidence in favor of primary excisions at the shoulder for shot injury derived from the experience of other wars.[2] The numerical statement of Dr. Chisolm[3] is

[1] The figures are as follows: *Primary*, 134; recovered, 21—furloughed, 17—fatal, 25—unknown, 71. *Intermediary*, 28; recovered, 4—furloughed, 5—fatal, 9—unknown, 10. *Secondary*, 10; recovered, 4—fatal, 2—unknown, 4. *Operations of Undetermined Date*, 29; recovered, 3—furloughed, 1—fatal, 7—unknown, 18.

[2] Thus LÖFFLER (F.) (*General-Bericht*, u. s. w., 1867, S. 288) observes: "From a statistical point of view, it is undoubtedly the duty of the field surgeon, in cases of shot wounds of the shoulder joint, to excise the joint during the first forty-eight hours after the reception of the injury. Has this period passed, operative interference should be deferred until the end of the period of inflammatory reaction. But statistical results are hardly necessary to convince the field surgeon of the advantages of primary resection. If resections of the joints are acknowledged to be a means of diminishing the ratio of mortality notoriously following abstention from operative treatment, it is difficult to see why the operation should be delayed until the aspect of the case has really become threatening. * * More astonishing still is the assertion that nothing is gained by a primary resection. Less danger to life and shortening of the period of confinement by disease are certainly advantages worthy of consideration. Uncertainty regarding the diagnosis and accumulation of labor during the first days following a battle, already encroach sufficiently upon the time for primary resection." STROMEYER (L.) (*Maximen der Kriegsheilkunst*, 1855, S. 694) remarks: "According to my view, in every well-attested case of injury of the bone with opening of the shoulder joint, resection is indicated as the only method which will prevent the threatening danger of a suppurative inflammation." SCHWARTZ (H.) (*Beiträge zur Lehre von den Schusswunden*, 1854, S. 205), treating of shot fractures involving the shoulder joint, and illustrating the subject by his experience in the Schleswig-Holstein war, emphatically declares (the italics are his own): "*All require the primary resection; the secondary should only be performed when the injury was overlooked in the first place, or if there was not time to resect during the first twenty-four hours.*" And, on page 207, he continues, after citing several excisions: "The last two cases teach obviously not only that anywise important cases of fractures of the humerus, extending within the capsular ligament, should be resected, but should be *primarily* resected." MACLEOD (G. H. B.), referring to excisions of the joints for shot injury (*Notes on the Surgery of the War in the Crimea*. 1858), avers: "So far as my observation went, primary excisions were much more successful than those done at a later date, both as regards the final results and the length of the period of convalescence." And DEMME (*Studien*, u. s. v., 1861, B. II, S. 224) argued to the same effect, and denies that excisions are more prejudicial to the transport of the wounded than unmolested shattered limbs: "The condition of the soft parts more than anything else speaks in favor of primary resection. There is no considerable infiltration, no carious destruction of the joint, no burrowing of pus nor softening of the fibrous tissues, no fatty degeneration of muscles,—complications that are likely to follow expectant treatment, directed to symptoms, complications that sometimes persist after secondary resection, rendering the complete restoration of the functions of the arm impossible. * * The advocates of secondary operations lay great stress upon the fact, that it is difficult to estimate the extent of operative interference requisite in recent shot injuries; that there is danger of too much or too little being removed. This objection may have some foundation; but to say that the transport of the wounded after the operation is more dangerous to patients, and more difficult, is an error, and I am convinced that the contrary is the fact."

[3] CHISOLM (J. J.) (*A Manual of Military Surgery*, Columbia, 1864, p. 377), in a "*Consolidated table of Resections, collated from records in the Surgeon-General's Office from June 1, 1862, to February 1, 1864,—prepared by Surgeon* H. BAER, P. A. C. S.," accounting for 41 primary and 27 secondary excisions at the shoulder, after shot injury, with a percentage of fatality of 31.7 and 25.9, respectively.

at variance with this conclusion, representing the secondary excisions at the shoulder as the practice to be most advantageously followed. Before discussing this question, it is proper to refer to the excisions at the shoulder for shot injury done elsewhere. Of these, more than four hundred well-authenticated examples have been published, besides several score of analogous operations, described by some authors as excisions or resections at the shoulder; but not thus recognized by other writers. Only in the last thirty or forty years has the operation come to be regarded as one of the legitimate regular procedures of military surgery. The cases belonging to this period are classified in the following tabular statement:

TABLE XLI.

Showing the Number of Excisions of the Upper Extremity of the Humerus for Shot Injury on the Occasions named, and from the Authorities quoted, with the Ratio of Mortality.

ACTIONS AND AUTHORITIES.	CASES.	RECOVERIES.	DEATHS.	RESULTS UNDETERMINED.	RATIO OF MORTALITY.

Apart from the references here tabulated, there have been published accounts, for the most part isolated, of particular instances of excisions at the shoulder for shot injury. Thirty-four of these, of which twenty-seven at least resulted favorably, are mentioned in the subjoined historical note.[1] An aggregate of four hundred and twelve cases is obtained by adding those included in the numerical statement on the preceding page. Or, laying

[1] Authors frequently mention THOMAS, of Pezenas, as the first who excised, in 1740, the head of the humerus; but it appears (SABATIER, *Mém. sur un moyen de suppléer à l'amputation du bras dans l'article*, in *Mém. de l'Institut National des Sci. et Arts*, Paris. An. XII (1804), p. 367) that THOMAS simply successfully *extracted*, for caries, in a girl, aged 4 years, a portion of the cylindrical part of the upper extremity of the humerus, about an inch and a half in length, and, the following day, the epiphysis forming the head of the humerus. The next case referred to is that of VIGAROUS, of Montpellier, said to have excised, in 1767 (GUTHRIE, G. J., *Gunshot Wounds*, 3d ed., 1827, p. 471, and PÉAN, J. E., *De la scapulalgie et de la résection scapulo-humérale*, Thèse, Paris, 1860, p. 45), the head of the humerus, for caries, in a lad of 17, who died shortly afterward; but, in a letter to M. SABATIER, an extract of which is published by the latter (*l. c.*, p. 373), M. VIGAROUS remarks: "Je n'ai point retranché la tête de l'os du bras." In 1768, CHARLES WHITE, of Manchester (*Cases in Surgery, with Remarks*, London, 1770, p. 57, and *Phil. Transactions*, 1770, Vol. LIX, p. 39), excised, for caries, the head of the humerus in a boy of 14; good motion of the limb being preserved. Three years later, in 1771, Dr. LENTIN (*Med. Chir. Bemerkungen*, 1771) successfully removed, for caries, the head and shaft of the humerus, with the exception of the lower two inches of the bone. From this time the operation was repeatedly and successfully performed by J. BENT, in 1771 (HUNTER, *Account of a Woman enjoying the Use of her right Arm after the Head of the os humeri was cut away*, in *Phil. Transact.*, 1774, Vol. LXIV, Part I, p. 353), who excised the head of the right humerus for caries, in a young girl, retaining perfect use of forearm;—by DANIEL ORRED, in 1778 (PERCIVAL (T.), *A Case in which the head of the os humeri was sawn off and yet the motion of the limb preserved*, in *Phil. Trans.*, 1779, Vol. LXIX, Part I, p. 6);—by MOREAU, the elder, in 1786 (MOREAU (P. F.), *Essai sur l'emploi de la résection des os*, Obs. I, 1816), in the case of a woman, aged 45, for caries; arm shortened two inches; good motion of forearm; and, by the same operator, in 1794 (*l. c.*, Obs., IV), in a widow, Moulin, aged 43, removing the head and shaft, 5½ inches in all; abscesses and fistulæ remained until her death, 10 years after the operation;—by the surgeon of the Cavalry regiment Berri, in 1789 (PERCY et LAURENT, Art. *Résection*, in *Dict. des Sci. Méd.*, 1820, T. 47, p. 546), in a boy, aged 13, for caries. Several other cases are mentioned by the last named authors (PERCY and LAURENT), but it is impossible to reconcile their statements in the above article with others made by them in the article *Humérus*, *Dict. des Sci., Méd.*, 1818, T. XXII, pp. 36, 37, a fact that, in a measure, may account for M. SABATIER'S silence regarding them. PERCY et LAURENT (*Dict. des. Sci. Méd.*, 1818, T. 22, p. 26) further declare: "Dès l'an 1794 nous présentâmes à feu notre collègue SABATIER, neuf exemples vivans de cette cure." [M. LEGOUEST (*De la Chirurgie mil. contemporaine*, in *Arch. gén de méd.*, 5e sér., 1859, T. XIII, p. 463) and Dr. R. M. HODGES (*The Excision of Joints*, 1861, p. 23) inadvertently cite nineteen operations, all accredited to PERCY.] PERCY complains that SABATIER, "le chirurgien, si justement célèbre fit dans la suite le sujet d'un mémoire où il ne jugea pas à propos d'en nommer l'auteur." But it is doubtful whether these cases were excisions, or mere removal of fragments; it would seem that at least some of them would have been reported in detail, especially as prior to that period no cases of excisions of the head of the humerus for shot injury are on record. The first case of excision for shot injury (the only series to be referred to hereafter in this note) that is reported in detail, is adduced by L. GROSBOIS (*Diss. sur l'amputation du bras dans l'article avec des remarques et observations sur la résection de l'extremité supérieure de l'humérus, etc.*, Paris, 1803, p. 34): Corporal Gaché, 18th regiment of the line, was shot through the right shoulder joint, at Roveredo, September 4, 1796; two days later he was admitted to the hospital at Verona. The head and a portion of the shaft were successfully excised by the author's brother, a noted surgeon in the French army. SABATIER, who is reported to have performed the operation of excision of the head quite frequently, describes, in his memoir to the Institute, the mode of operation, but does not claim to have practised it, although he carefully cites all authentic cases known to him. LARREY (D. J.), alleged to have operated in ten instances, remarks (*Rélation hist. et chir. de l'expédition de l'armée d'Orient*, 1803, p. 314, and *Mém. de Chir. mil. et camp.*, 1812, T. II, p. 174): "J'ai eu la bonheur de prevenir dix fois ces accidens, et d'éviter l'amputation qu'ils auraient nécessitée, en fesant l'extraction entière de la tête de l'humérus, ou des ses fragmens;" but his cases were, undoubtedly, not cases of excisions, but removal of fragments, etc., as he remarks elsewhere (*Mém. de Chir. mil. et camp.*, 1812, T. II, p. 172): "Mais je n'ai point à m'occuper de la résection de la tête de l'humérus que je n'ai pas eu occasion de pratiquer; il me suffira d'avoir fait sentir la différence qui exist entre cette opération et l'extraction de la tête de l'humérus, séparée par une fracture de son col, ou réduite en fragmens." The second authentic excision for shot injury was reported by M. PORET (*Obs. sur la résection de la moitié supérieure de l'humérus, après un coup de feu près l'articulation*, in *Jour. de méd. chir. phar.*, T. XXII, Juillet, 1811, p. 425), who excised the head of the humerus in the case of a soldier of the 95th regiment, who had been shot through the upper third of the humerus. The operation was performed on March 12, 1809, by M. PORET, in the presence of MM. LIXON, MANTEL, and FAYET. The patient recovered "toutes les fonctions se faisaient parfaitement bien." 3. According to JÆGER (*Operatio resectionis*, Erlangæ, 1832), WILLAUME, in 1812, successfully excised the head of the humerus. 4. MOREAU (P. F.) (*op. cit.*, 1816, Obs. 3) performed the operation on December 22, 1812, in the case of Sebastian Vilain, 65th of the line, who had been wounded in Spain, July 22, 1812; the head and four inches of the shaft were removed for caries; the patient recovered, with considerable use of the arm. 5. Dr. R. M. HODGES (*The Excision of Joints*, 1861, p. 24) records, on the authority of an eye-witness of this operation, that "In the United States it was first practised for gunshot wounds by Dr. Wm. Ingalls, of Boston, in the winter of 1812-13. The patient was a soldier in the United States Army, and he recovered with a tolerably useful limb. 6. Naval Surgeon BROWN, in 1814, excised the head of the humerus of Lieutenant Duncan of the Navy, wounded a few days before the battle of Plattsburgh, September 11, 1814, the patient recovering, with good use of the forearm. The case is detailed by Dr. H. HUNT (*Am. Med. Recorder*, 1818, Vol. I, p. 365). 7. 8. MANN (J.) (*Med. Sketches of the Campaign of* 1812, '13, '14, Dedham, 1816, p. 208) cites the cases of two seamen of Commodore McDonough's fleet, wounded at the battle of Plattsburgh, September 11, 1814, by cannon balls; the fractured heads of the humeri were excised. 9. 10. LEGRAND (de Brège) (*Diss. sur la résection de la tête de l'humérus*, 1814) twice resected the head of the humerus for shot wounds, in 1814. 11. MOREAU (P. F.) (*op. cit.*, 1816, Obs. 5) excised the head of the left humerus in the case of Gautier, aged 24, wounded June 16, 1815; little use of the arm was retained. 12. W. R. MOREL, as reported by Sir J. MCGRIGOR (*Case of Gunshot Wound of the Shoulder joint*, in *Med. Chir. Trans.*, 1816, Vol. VII, p. 161), resected the head of the humerus, in the case of Th. Ellard, 18th Hussars, wounded at Waterloo, June 18, 1815. Recovery, with "little motion in the shoulder, but all the variety of motion of which the forearm and hand are capable." GUTHRIE (G. J.) (*A Treatise on Gunshot Wounds*, 1827, p. 470), in his chapter on "Excision of the Head of the Humerus," cites various cases from the British campaigns, 1810–1815, but, with the exception of the case of Ellard, above cited, they are all cases of removal of loose fragments. While the conservative treatment, as carried out by THOMAS, BOUCHER, and others, was practised extensively by military surgeons, the excision of the bone, as performed by WHITE, MOREAU, and others, was little favored by the former, and, as late as 1820, the eminent HENNEN (*op. cit.*, 3d ed., 1829, p. 30) remarked, that it was "not generally adopted;" and added: "I have never seen it performed on the field, and, in hospital practice, I have only seen one case of it. * * Upon the whole, I am inclined to think that the excision of the head of the humerus will be found to be an operation more imposing in the closet than generally applicable in the field." 13. 14. 15. BRIOT (*Histoire de l'état et de progrès de la chir. mil. en France*, 1817, p. 16) remarks: "M. BOTTIN a opéré une cure semblable à Barcelonne; M. COURVILLE une a Mayence; MM. PERET et LAFAYE ont également réussi, dans un cas extrêmement compliqué, a conserver le bras à une jeune soldat qui était à l'hopital de St. Sébastien." 16. VERNET (*Letter autograph*, Bayeux, 1819) resected the shoulder joint for shot injury, but I have not been able to determine the result. 17. REYNAUD (YVAN) (*Résection de l'extrémité supérieure de l'humérus à l'occasion d'un coup de feu*, in *Arch. gén. de méd.*, 1827, T. XV, p. 464) excised the head of the humerus in the case of a marine, at Toulon, who had received two balls in the shoulder: "Là une nouvelle articulation s'est formée en 8 ou 9 mois, et aryourd'hui le malade peut exécuter des mouvemens dans tous les sens." 18. BRYCE (CH.) (*Three cases of Surgical Operations*, in *Lancet*, 1831, Vol. II, p. 742) relates the case of a soldier wounded at Phalerus, Greece, in May, 1827; resection of the head of the humerus was performed, but the patient died. 19. ROUX (J. N.), à Brignoles (*Gaz. méd de Paris*, 1836, T. IV, p. 72), in 1836, excised the head of the humerus for shot injury, and the patient recovered,

aside fourteen instances in which the results were unknown or only partially determined, a series of three hundred and ninety-eight excisions at the shoulder for shot injury is collected, with two hundred and forty-two, or somewhat more than sixty per cent. of recoveries. Operations by Larrey, Percy, Guthrie, and others, referred by many writers to this category, have not been added to it, either because the operators explicitly declared that the cases could not be considered examples of formal excisions, or on account of some ambiguity in the records, or hazard of duplicating identical instances.[1] Although the period of operation in this series could not be determined with precision in more than half of the cases, the imperfect analysis was very favorable to primary excision.

Of the nine hundred and fifty-one completed observations of this operation reported from the American war,[2] there were six hundred and three recoveries, a percentage of 63.4. The distribution of these cases according to the period of operation is minutely explained on page 599, and it clearly appears that the mortality of the consecutive operations exceeded that of the primary in a proportion greater than ten per cent. The concurrent testimony of two such large bodies of facts affords a strong presumption in favor of primary excisions, although many surgeons entertain an opposite view.[3] There would probably be less difference of opinion if a ternary, instead of a binary, classification of operations[4] were more

with good use of forearm and some use of arm. 20. BADDELY (P. T. H.) (*Proceedings of Surgical Society of Ireland*, in *Dublin Med. Press*, Dec. 14, 1842) relates the case of a Hindoo soldier, aged 21, who had shot himself in the shoulder; secondary excision of the head of the humerus; recovery, with complete use of forearm and hand; can elevate the arm almost to a right angle with the body. 21. LERICHE (*Mém. de la Soc. d'emulation de Lyon*, 1842) successfully performed the operation. 22. STRATTON (TH.) (*Case of Gunshot Wound and Excision of the Head of the Humerus*, in *Edinb. Med. and Surg. Jour.*, 1846, p. 30) successfully excised the head of the humerus in a Chippewa Indian boy, aged 6, shot in the shoulder, in 1841; an intermediary operation. 23. WILLIAMSON (G.) (*Notes on Gunshot Injuries, etc*, in *Dublin Quart. Journal*, 1859, Vol. XXVIII, p. 81) cites the case of John Morgan, shot at Idaliff, September, 1842; the head of the humerus was excised on June 22, 1841; patient "gradually regained power of motion in the arm." 24. Dr. BEITH, of the Royal Navy (*Gunshot Wound through the Shoulder Joint. Excision of the Head of the Humerus; Recovery, with Hinge-like Movement of the Articulation*, in *Lancet*, 1856, Vol. I, p. 207). 25, 26. WILLIAMSON (G.) (*loc. cit.*, p. 81) cites two successful cases from the Indian mutiny, 1858, one a primary, the other a secondary operation. 27. DYAS (W. G.) (*Resection of the Head of the Humerus for Gunshot Wounds*, in *Chic. Med. Jour.*, 1859, Vol. XVI, p. 764) removed the head of the humerus, shattered by gunshot, in the case of W. B——; the result is not stated. 28. MATTHEW (T. P.) (*Stat. San. and Med. Reports of the Army Med. Department*, London, 1861, p. 399), in 1859, successfully excised the head of the humerus in the case of Fraser, 93d regiment. 29. EVE (P. F.) (*Nashville Jour. of Med. and Surg.*, July, 1860), the case of a young man, aged 16, accidentally shot in the shoulder; head of the humerus excised; recovery, with good use of limb, being able to raise the arm to a level with the clavicle. 30. v. PITHA (PODRAZKI, *Ueber Schusswunden*, in *Oester Zeitschrift für prakt. Heilkunde*, B. VII, 1861) removed the head and portion of the shaft of the right humerus for shot injury; patient "does, with the fingers of this arm, the finest carving." 31. Chief Surgeon RIEDL (*Allgemeine Militairärztl. Zeitung*, 1864, Nos. 17, 18) removed the head of the humerus in the case of a soldier who had attempted to commit suicide; recovery, with good use of forearm and tolerable good use of arm. 32. Surgeon RUDGE, 9th Bengal Artillery (*Brit. Army Med. Dept. * * Reports*, 1866, Vol. VI, p. 520), in 1865, excised the head of the humerus of a sapper shot through the axilla. The patient recovered, with good use of the forearm, and, "in fact, with very little exception, the entire use of the arm had been restored." 33. FITZGERALD (J. W.) (*Western Jour. of Med.*, 1869, Vol. IV, p. 112), in 1868, successfully removed the head of the left humerus, in a girl of nineteen, for comminuted shot fracture. 34. MINER (W. W.) (*Excisions Involving the Joints of the Upper Extremity*, in *Buffalo Med. and Surg. Jour.*, 1871, Vol. XI, p. 82) excised "the head, with the upper and middle two-thirds of the humerus," for gunshot injury of the shoulder; recovery, with perfect use of forearm, but very little motion of arm. I have endeavored in this note to refer only to isolated cases of excisions of the upper extremity of the humerus for shot injury, and the large number of cases collected from publications on special campaigns have been grouped in tabular form, see TABLE XLI, p. 607.

[1] All this is explained, at as great length as space will allow, in the preceding note. I must say, however, that notwithstanding the disclaimer of the illustrious LARREY, several of his operations appear to me to have been excisions at the shoulder for shot injury, in the strictest sense. I cannot find, in either of PERCY'S three articles, that he ever practised this operation after injury, although he collected a number of cases of excision for disease, and presented some of the recovered patients to the institute, and deserves much credit for his earnest advocacy of resections. The operations attributed by some writers to SABATIER, refer simply to those cases collected by PERCY. There are many other well known, authenticated cases, which, at first sight, might appear to be omitted in TABLE XLI; but are, for the most part, grouped under the heads of the different campaigns, as the operations by Professor LANGENBECK, STROMEYER, SCHWARTZ, etc., in the Dutchies, those of MM. BAUDENS and LEGOUEST, in the Crimea.

[2] The gross aggregate is one thousand and eighty-six operations, of which in one hundred and thirty-five instances the ultimate results were unknown or only partially known. While regarding the importance of such naked numerical statements and comparisons as vastly overrated, they appear to afford the only feasible mode of presenting in a small compass the results of such large numbers of cases.

[3] Thus SOCIN (A.) (*Kriegschir. Erf.*, 1872, S. 155), treating of excisions at the shoulder after shot fracture, while admitting that he has had no personal experience on the subject, opines that "primary resection should be confined to those cases in which extensive splintering of the bone can be diagnosticated;" but adds: "Should the considerably more favorable mortality-rate, observed in the American War (Circular 6), be confirmed, the field of primary resection should be extended, as, as a matter of course, the vital prognosis should be preferred to the functional." And BILLROTH (T.) (*Chir. Briefe aus den Kriegs Lazarethen*, u. s. w., 1872, S. 210) contends that "primary resection is only to be practised when the splintering in the joint is very extensive." HODGES (R. M.) (*Exc. of Joints*, 1861, p. 29) strongly presents the arguments of the advocates of deferred operations. For the views of the writers on the other side, see the note on page 606.

[4] SWINBURNE (J.) (*Conservative Surgery*, in *Med. and Surg. Reporter*, Philadelphia, 1862–3, Vol. IX, p. 377) observes: "Now authors divide operations into primary and secondary. My experience induces me to make still another division, which is primary, secondary, and tertiary; the tertiary corresponding with the secondary operations of authors. It must be remembered that the stage which I designate as secondary is one of congestion and inflammation, where the capillary, small arteries, and veins become large reservoirs, and all the parts as a mass of distended blood vessels possessed of imperfect vitality. If, in this condition, any operation is performed, reparation goes on slowly, if at all; perhaps mortification and extensive sloughing of all the parts take place, and death follows, either from pyæmia, gangrene, exhaustion, or shock to the sensitive nervous system.

generally adopted.[1] It is a general rule, applicable to all excisions and amputations, that those practised during the intermediary or inflammatory stage are by far the most dangerous, and should never be performed except as compulsory operations. *If the patient survives this period* he generally attains a condition in which operations are tolerated even better than in full health, and the ratio of mortality of the true secondary or ulterior operations is less than that of immediate or primary operations. But how many patients perish in the experiment. Alcock has well observed that the mode in which authors have defined the several periods has had no small share in producing discrepancy of opinion on the subject.

Of the entire aggregate of one thousand and eighty-six excisions at the shoulder joint, reported from the American war, seven hundred and thirty-nine were practised on Union, and three hundred and forty-seven on Confederate soldiers. The mortality-rates of the completed cases[2] was 35.7 per cent. on the Union, and 39.4 per cent. on the Confederate side. In the latter group, however, the ratio is of little value, since the terminations of nearly two-fifths of the cases are unknown, yet, could they be ascertained, might greatly diminish or largely augment the proportion of deaths.

The side on which the excision was practised was recorded in eight hundred and seventeen instances. Four hundred and two were on the right, and four hundred and fifteen on the left side. One hundred and forty-six, or 36.6 per cent. of the former, and one hundred and twenty-four, or 29.8 per cent of the latter, proved fatal; conclusions that reverse the inference of the celebrated Herr Esmarch, suggested by his earlier experiences in Schleswig-Holstein, that "the operation on the left side seems to give less favorable results than on the right."[3]

The slight numerical predominance of shot injuries of the left shoulder, too uniform in the various subdivisions to be accidental, has been ascribed to the exposed position of the left shoulder in firing, in the troops composing the great bulk of an army. Dr. George C. Harlan,[4] who served, with great distinction, with the cavalry, throughout the war, has

[1] We are indebted to BOUCHER for the proposition of a three-fold division of operations, according to the period at which they are performed. It appears in the second of his celebrated memoirs on shot wounds, published in 1753, in the second volume of the memoirs of the old French Academy of Surgery, at page 466. It is worth while to give a literal translation of his definitions: "I distinguish," he says, "three periods in which amputation may be practised: *Firstly*, the time immediately succeeding the infliction of the injury and preceding the development of complications. It is known that, after wounds by firearms, tension, inflammatory swelling, pulsations, acute pains, fever, etc., which are the ordinary consequences, do not appear immediately, and that these symptoms are more or less slow in presenting themselves, according to the size and complication of the wound, the temperament and constitution of the patient also having their influence. *Secondly*, the period when complications, being more or less developed, are more or less liable to affect the animal economy. *Thirdly*, the time when the grave complications have relaxed their violence, or have absolutely calmed down; the period that M. FAURE requires in order to be able to operate with advantage." It must be remembered that BOUCHER'S judgment was formed after an immense experience of field surgery, at Ramilies and Fontenoi, and many other of the great battles in the Low Countries. RUTHERFORD ALCOCK (*Notes on Med. Hist. of the British Legion in Spain*, 1838, p. 66), quoting these definitions, declares that: "Against this division of periods nothing can be urged: they are distinct, successive, and easily appreciated, constant in their order, and generally with intervals very sufficiently marked." At the present day this classification is adopted by Drs. LOEFLER, LEGOUEST, BECK, BILLROTH, and many others.

[2] The result as to fatality was determined in seven hundred and thirty-six of the Union cases, the deaths numbering two hundred and sixty-three, or 35.7 per cent. In the series of three hundred and forty-seven Confederate cases, the terminations were ascertained in all but six of the one hundred and forty-six instances enumerated in the tables from XXII to XXXIX inclusive, and in seventy-five of the cases in TABLE XL, or in two hundred and fifteen Confederate cases altogether, with eighty-five deaths, or 39.4 per cent. The results of the large number of one hundred and thirty-two undetermined cases might, as has been already remarked, seriously modify these proportions.

[3] ESMARCH (F.), *Über Resectionen nach Schusswunden*, Kiel, 1851, S. 49: "Auffallend ist es, dasz nach den statistischen Berechnungen die Operationen des linken Armes für das Leben des Verwundeten gefährlicher zu sein scheinen als die des rechten. * * * Darnach würde sich die Sterblichkeit bei den Operationen am linken Arm zu denen am rechten, wie eins zu drei verhalten; indessen sind zu einem solchen Schlusse natürlich grössere statistische Untersuchungen erforderlich, da diese Verhältnisse von Zufälligkeiten abhängen können."

[4] In a letter to the editor, dated March 31, 1868, Dr. G. C. HARLAN, of Philadelphia, formerly Surgeon 11th Pennsylvania Cavalry, and chief medical officer of the Cavalry Division of the Army of the James, wrote: "I see you attribute the greater frequency of wounds of the left shoulder to the fact that it is advanced in the act of firing. [Referring to a remark on page 56, of Circular 6, S. G. O., 1865.] The rule seems proved by the exception: that in cavalry, the reverse is the case, so far as I have seen. You will notice that, in the cases I send you, the right side is the one injured in every instance. I can recall several others in which the case was the same. The right being the sword arm, is, of course, advanced in a charge, as well as in the use of the pistol." The reader may recall the case described by LARREY, of a famous swordsman, who had received a sword thrust in the left flank. The location of the wound puzzled LARREY, until he discovered that the grenadier was left-handed. Many other illustrations might be given of the effect of position on the location of wounds.

made the ingenious observation, that this rule is proved by an exception; since it can be shown that, in the cavalry, where the sword or pistol arm is advanced, the *right* shoulder is more frequently the seat of operation.

It is of interest to observe the steady increase in the relative frequency of excisions at the shoulder as the war progressed and the surgeons acquired experience.[1] The earnest recommendations of the medical directors doubtless had some share in leading the operators to resort to excision rather than amputation whenever practicable.[2]

The utility of the limb after excision of the shoulder joint for shot injury, though greater, in the majority of cases, than might be inferred from the reports of the pensioners, is generally less than is recovered in some instances of anchylosis after disease. Mr. Holmes, in his excellent paper on excisions, well describes the amount of motion obtained.[3] I have observed but two instances in which the power of abduction was nearly if not completely restored.[4] In the majority of cases that I have examined, motion in flexion, extension, and adduction was tolerably well preserved. I have met with no instance of true anchylosis.[5] In a large proportion of the cases, the functions of the forearm and hand were but slightly, and, in many, not at all impaired. Those who argue that the limb is useless after an excision at the shoulder because it dangles by the side, display a superficial appreciation of the considerations to be taken into account. Apart from the inestimable value of even a partial use of the hand, the mere weight of the limb, though its motor functions be completely destroyed, is of advantage in preserving the equilibrium of the body, and avoiding the distressing deformity consequent on ablation.

Pyæmia,[6] often accompanied by suppurative inflammation of the medullary cavity of the shaft, was the most frequent cause of death; and consecutive hæmorrhage next in

[1] In 1861, there were but two excisions at the shoulder for shot injury: Dr. BONTECOU's successful case from the first battle of Bull Run (p. 597), and the unsuccessful case of Lieutenant Ream (p. 598), reported by Dr. J. H. BRINTON, from Belmont. In the case of Corporal K——, New York Volunteers, which furnished the Museum with Specimen 347, Section I, beautifully figured at page 113 of the Surgical Catalogue of 1866, a case that might be regarded as almost a typical one for decapitation of the humerus, Dr. GOURLEY advocated that treatment in the consultations held at the time of the accident, July 26, 1861; but he was overruled, and reminded of HENNEN'S dictum. In 1862, there were 116 excisions at the shoulder, the partial return of shot wounds numbering 49,730. In 1863, there were 191 such operations, from a return of 55,377 shot wounds. In 1864, there were no less than 498 operations, the total return of shot injuries being 110,782. In 1865, with 18,320 cases of shot injury, there were 74 excisions at the shoulder. In 1866, 388 shot injuries were returned without any excisions at the shoulder. There was one excision in 1867, for an old injury, and three of unknown date, making the total of 885 excisions classified in Table XXXIX.

[2] In a note to General Orders 30, October 3, 1861, from General MCCLELLAN'S Headquarters, Medical Director C. S. TRIPLER announced that: "The medical director desires that exsection of the shoulder and elbow joints shall be resorted to, in preference to amputation, in all cases offering a reasonable hope of success."—(APPENDIX TO PART I, *Med. and Surg. Hist. of the War*, p. 60.) A recommendation of excisions of the head of the humerus instead of amputations at the shoulder joint is expressed in the report of Surgeon H. S. HEWIT, Medical Director of the Army of the Ohio.—(APPENDIX TO PART I, p. 311.) References are made in the same volume of appended documents to excision at the shoulder for shot injury, by Surgeon D. P. SMITH, U. S. V. (*op. cit.*, p. 24); by Surgeon R. MURRAY, U. S. A. (*op. cit.*, p. 38); by Surgeon J. B. BROWN, U. S. A. (*op. cit.*, p. 68); by Ass't Surgeon J. S. BILLINGS, U. S. A. (*op. cit.*, pp. 136 and 202); by Surgeon J. G. HATCHITT, U. S. V. (*op. cit.*, p. 253); by Surgeon C. J. WALTON, 21st Kentucky, (*op. cit.*, p. 264); by Surgeon W. GRINSTEAD, U. S. V. (*op. cit.*, p. 308); by Surgeon A. M. WILDER, U. S. V. (*op. cit.*, p. 319); by Surgeon E. F. SANGER, U. S. V. (*op. cit.*, p. 335).

[3] HOLMES (T.) (*A System of Surgery*, 2d ed., 1871, Vol. V, p. 667): "The arm can never, as it seems, be elevated beyond the horizontal line; while in many cases it hangs down, without any power whatever in the deltoid, at a greater or less distance from the scapula. But the movements of flexion, extension, and adduction are usually free; abduction can often be effected to the extent of raising the arm considerably from the side; and there is usually sufficient power in the forearm to carry heavy weights and perform many of the ordinary domestic tasks."

[4] Case of Lieutenant H. G. Jacobs, page 553, CASE 1533, and PLATE XIV, FIG. I, and the case of a pensioner who visited the Museum in May, 1875, whose name I cannot recall.

[5] RUPPRECHT (L.) (*Militärärztliche Erfahr.*, u. s. w., 1871, S. 62), speaking of secondary excisions of the head of the humerus, observes that: "The secondary operations were very much aggravated by deformities, gradually appearing after the injury, through thickening of the periosteum especially, and by extensive cavities succeeding abscesses. Immediately after the operation even, healing was retarded by pus formations, sometimes under the clavicle, in other instances under the scapula, again on the anterior aspect of the upper arm. Aside from the greater muscular atrophy, due to debility resulting from antecedent tedious suppurations and to pain and loss of sleep; apart, also, from the redundant granulations attending secondary operations, and resulting prejudicially in regard to the future usefulness of the limb, the disadvantages of secondary operations already adduced were of sufficient importance to permit us to declare that primary resection at the shoulder joint is preferable to the secondary operation."

[6] SÉDILLOT (*Du traitement des fractures des membres par armes de guerre*, in *Arch. gén. de méd.*, 1871, VI^e sér. T. XVII, pp. 392-97), citing ten cases of excision of the head of the humerus, of which seven were fatal, ascribes this large mortality to the unfavorable hygienic and atmospheric conditions under which the operations were performed, and concludes: "Le plus sage est de n'entreprendre que des résections limitées à la tête et au col de l'humérus, de faire une incision peu étendue, de diviser l'os avec la scie à chaîne, qui exige moins d'espace; de fermer la plaie provisoirement avec quelques points de suture, et d'immobiliser le membre sans l'allonger ni le trop raccourcir, avec la précaution que l'extrémité osseuse n'exerce aucune pression sur les parties molles. Si la diaphyse était fracturée et les désordres considérables, on pratiquerait immédiatement la désarticulation. Il ne faut pas oublier que la résection humérale guérit assez lentement et que la persistance d'une plaie exposée à des contages infectieux est, comme nous l'avons dit, une cause permanente de danger."

frequency as a source of fatality. There were seventy-nine fatal examples of the former, and sixty-seven of the latter, including eleven instances in which large arteries were consecutively ligated. There were twenty-seven cases of erysipelas, with fourteen deaths; twenty-four cases of gangrene, with fifteen deaths; and two fatal cases of tetanus.

It is unnecessary to say much of the mode of operation.[1] The anterior longitudinal incision, commonly known as Langenbeck's method, was the favorite procedure; though a number of operators preferred to raise a deltoid flap, or to connect a transverse oblique cut with the apex of the vertical incision. There were no reported instances of real subperiosteal excisions, nor any examples of reproduction of bone to any great extent.

The necessity of amputation after excisions at the shoulder seldom arose, ablation of the limb having been practised in but fourteen[2] of the thousand and eighty-six cases of excision. Eight of these consecutive operations resulted successfully, six fatally.[3] They were done at periods varying from nine days to three years from the date of accident.

---

[1] RUPPRECHT (L.) (*Militärärztliche Erfahr.*, u. s. w., 1871, S. 62) declares that: "The shoulder joint resection compared with other resections exhibits very satisfactory results. It demands the least special operative skill of any excision except that at the knee joint. It requires, in the after treatment, the least complicated bandaging; for, generally, a simple triangular sling suffices. Moreover, the patient commonly suffers less from the date of operation until recovery than after other excisions."

[2] Three of the cases will be found in TABLE XXIV, p. 531, etc.—(the periods recorded are the intervals between the excision and amputation): CASE 24, Dibble, gangrene, two months; CASE 71, Mesley, gangrene, one month; CASE 81, Myers, hæmorrhage, sixteen days. Three fatal cases are found in TABLE XXV, p. 536, etc.: CASE 13, Fee, hæmorrhage, a fortnight; CASE 22, Green, hæmorrhage, one month; CASE 27, *Harril*, hæmorrhage, nine days. Three successful cases occur in TABLE XXXI, p. 554, etc.: CASE 21, Burger, gangrene, three years; CASE 105, Keeler, chronic osteomyelitis, two years; CASE 161, Rosa, chronic osteomyelitis, nineteen months. Three fatal cases appear in TABLE XXXII, p. 570, etc.: CASE 41, Lawson, hæmorrhage, sixteen days; CASE 65, Smith, osteomyelitis with necrosis, six months; CASE 76, Welch, hæmorrhage, twenty days. There is a case of recovery in TABLE XXXIII, p. 576: CASE 65, Shepler, gangrene, one month. Lastly, a successful instance occurs in TABLE XXXV, p. 591: CASE 29, Kernier, osteomyelitis, three months.

[3] Besides the works cited in preceding notes, the observations on the subject in many of the later systematic treatises on surgery may be advantageously consulted, as well as the special publications enumerated in the following partial bibliography of excisions at the shoulder: AHLSLRUPPE (*De resectionibus*, Helsingfors, 1840); ALCOCK (R.) (*Observations on Injuries of Joints and their Treatment*, in *Med. Chir. Trans.*, 1840, Vol. XXIII, p. 243); BECK (B.) (*Zur Statistik der Amputationen und Resectionen*, in LANGENBECK'S *Arch für Klin. Chir.*, 1864, B. V, p. 171); BLACKBURN (*An Essay on the Excision of Diseased Joints*, in GUY'S *Hospital Reports*, 1836, Vol. I, p. 274); BLANDIN (P. F.) (Article *Resection*, in *Dict. de méd. et de chir. prat.*, T. XIV, Paris, 1835, p. 248); BOURBIER (*Diss. de necessitate et utilitate cam in fructuris et luxationibus complicatis ossis portionem serra discindendi quæ alterius repositionis obnititue*, Strasbourg, 1776); BUTCHER (R. G. D.) (*On Excision of the Joints*, in *Dublin Journal*, February, 1857); CHAMPION (L.) (*Traité de la résection des os cariés dans leur continuite ou hors des articulations*, Paris, Thèse, 1815); DENOUÉ (E. S.) (*Essai sur l'utilité de la resection des os dans les membres*. Paris, 1812); DYAS (W. G.) (*Resection of the Head of the Humerus for Gunshot Wounds*, in *Chir. Med. Jour.*, 1859, Vol. XVI, p. 764); FLOURENS (*Théorie experimentale de la formation des os*, Paris, 1847); FRANCKE (P. F.) (*Einiges über Gelenkresectionen der langen Röhrenknochen*, Diss., Leipzig, 1870); GERDY (J. V.) (*De la résection des extremites articulaires*, Paris, 1839); GIRCOURT (G.) (*Essai sur l'histoire des plaies et de la résection de l'épaule*, Paris, 1872); GREEN (W. A.) (*Cases of Operation upon Diseased Joints*, in *Indian Annals of Med. Sci.*, April, 1855); HARDAY (G.) (*Med. Times and Gaz.*, Dec. 17, 1864, p. 664) exhibited to the Pathological Society of London a specimen from a case in which the head of the humerus and glenoid cavity of scapula had been excised 50 years before; HEIM (*Die Resectionen*, Würzburg, 1855); HEYFELDER (J. Sci.*, 1853, Vol. XXV, p 346); WETZLAR (*De articul. resectione*, Bonn, 1832).

Something further will be adduced regarding the indications and comparative value of expectant measures, excisions, and amputations, for shot injuries near the shoulder, at the close of the Section.

AMPUTATIONS AT THE SHOULDER.

Eight hundred and sixty-six examples of amputations for shot injury, by exarticulation at the shoulder joint, were reported. Fourteen of these, practised on account of complications attending injuries of the soft parts, have been enumerated in TABLE XIV, on page 468, in the first Section of this Chapter. Eight hundred and fifty-two cases will be referred to here, the results having been ascertained in all but twenty-eight.

SCAPULO-HUMERAL AMPUTATIONS AFTER SHOT FRACTURE.—A large proportion of these cases were primary operations, practised on account of shot fractures of the upper part of the humerus, generally with implication of the joint, and with such lesions of the soft parts as precluded a resort to excision. Others were performed on account of consecutive disease involving the upper arm.

[1]Amputation at this joint for gangrene was advised by HIPPOCRATES, HELIODORUS, GALEN, ABU'L KASEM, PARÉ, HILDANUS, and others. In 1642, PIGRAY (P.) (*Epitome des prec. de méd.*, 1642, p. 130, Chap. IX, *de la curation de sphacele ou sideration*) observes: "Aucuns sont difficulté de couper dans la jointure ou prés d'icelle, à cause des parties nerveuses: toutefois d'autant que l'on les coupe du tout et promptement, les accidents n'en sont pas si grands, j'en ay veu plusieurs qui ont bien succedé." BARBETTE (P.) (*Thesaurus Chirurgiæ*, 3d Eng. ed., London, 1676), while speaking of the point of amputation, remarks: "Except the mortification hath extended itself to the uppermost parts of the arms or thighs; for then we are forced to take the joint itself;" but there is no evidence that he knew of any instance of scapulo-humeral amputation. PURMANN (M. G.) (*Lorbeer-Krantz*, 1692, B. III, S. 229) relates a case of amputation of the arm and adds: "Some say, the amputation can be most readily, and should be, performed in the joint nearest above the injury," but adds: "I have never performed this operation." In the *Jour. de méd.* de M. DE LA ROQUE, an 1686, Juin, p. 3, is related a case of gangrene of the arm, treated by Surg. LA GARENNE, and subsequently by another surgeon: "Qui prit une petite scie pour emporter l'os du bras; mais s'étant apperçu qu'il branloit vers son articulation avec l'épaule, il y donna quelques légéres secousses, et l'os sortit facilement de sa boëte." The patient, a boy, recovered. MORAND (F. S.) (*Opuscules de Chirurgie*, 1768, T. II, p. 212) claims that his father first performed amputation at the shoulder joint: "C'est mon père qui a fait le premier cette opération aux *Invalides*, et c'est à tort que quelquesuns ont cru devoir l'attribuer à M. LEDRAN le père qui avait été Chirurgien-major des Gardes Françaises. Il est vray que M. LEDRAN fit cette opération ensuite avec succès, mais il en accordait lui-même la priorité a mon père." And LA FAYE, in his notes to DIONIS, *Cours d'opérat. de Chir.*, 1750, p. 758, ascribes the first operation to SALVADOR MORAN [*i. e.*, SAUVÉUR FRANÇOIS MORAND]. LEDRAN (H. F.) (*Observations de Chirurgie*, 1731, T. I, p. 315) relates that his father (in 1715) exarticulated the arm of M. Comadeux for caries, in the presence of MM. ARNAUD, PETIT, and others, and that the patient recovered. GARENGEOT (*Traité des op. de chir.*, 1738, 2d ed., T. III, p. 455) describes the operation at length, and, on page 465, remarks that "le jeune Marquis de Coëtmadeu, gentilhomme de Bretagne (evidently LE DRAN'S patient) soit péri en six mois après la cure de cette amputation, quoique très-parfaitement guéri, mais par une abondance de sang." MIHLES (S.) (*The Elements of Surgery*, London, 1746, p. 178) states that DU VERNEY successfully exarticulated the arm, at Paris, on September 24, 1730, in the presence of BOERHAAVE. RAVATON (*Chir. d'armée*, 1768. *Obs.* LVI, p. 262) amputated the arm at the shoulder joint in a soldier wounded May 13, 1734, the case terminating fatally; and on page 266 (*Obs.* LVII) records a case of shot wound of the head of the humerus in 1744, and of successful exarticulation by a surgeon whose name he could not ascertain. HEISTER (L.) (*Institutiones chirurgicæ*, 1739, P. I, p. 510) describes the operation although he never performed it. SHARP (S.) (*A Treatise on the Op. of Surgery*, 1740, p. 220) observes: "There are in armies a great many instances of gunshot wounds of the arm near the scapula, which require amputation at the shoulder; but the apprehension of losing their patients on the spot by the hæmorrhage has deterred surgeons from undertaking it." LA FAYE (*Nouvelle method pour faire l'opération de l'amputation dans l'articulation du bras avec l'omoplate*, in *Mém. de l'Acad. de Chir.*, 1753, T. II, p. 242): "Depuis 1740, que j'ai lû ces reflexions à l'Académie, plusieurs célébres chirurgiens ont adopté cette méthode et l'ont pratiqué à l'armée avec succès." FAURE (V. M.) (*Mém.* in *Prix de l'Acad. de Chir.*, 1819, T. III, p. 337) and BOUCHER (*Obs. sur des playes d'armes à feu, etc.*, in *Mém. de l'Acad. de Chir.*, 1753, T. II, p. 463) exarticulated the arm of an English soldier, aged 25, shot through the shoulder joint, at Fontenoy, in 1745; the operation was performed 29 days after the injury; the man recovered. BEAUSSIER (*Sur une nouvelle maniere de faire l'amputation du bras dans l'article*, in *Jour. de Méd., chir., phar.*, Janvier, 1768, T. XXVIII. p. 530) observes: "*J'ai vu faire deux fois l'amputation de l'humerus dans l'article; je l'ai faite une fois à l'armée, après un coup de feu, qui ne laissait que ce moyen de sauver le blessé.*" DAHL (P. H.) (*De humeri amputatione ex articulo*, in SANDIFORT, *Thesaurus dissertationum*, 1768, Vol. I, p. 37) exarticulated the arm at the shoulder). BROMFIELD (W.) (*Chirurgical Observations and Cases*, 1773, p. 209) performed the operation several times prior to his publication, and remarks: "I must acknowledge I had but little encouragement to do it at first, from those who had seen it performed repeatedly in the army." ALANSON (E.) (*Practical Observations on Amputations*, 1782, 2d ed., p. 180) records a successful case of exarticulation at the shoulder joint for shot injury, arm being blown off at the insertion of the deltoid. MICHÆLIS (*Briefe aus New York*, in RICHTER'S *Chir. Bibliothek*, Gottingen, 1782, B. VI, S. 125) saw, at Charleston, South Carolina, in 1778, a French soldier, wounded during Count Estaing's expedition against Savannah; the arm had been amputated at the shoulder joint and the patient recovered. Dr. JOHN WARREN performed the earliest exarticulation at the shoulder in this country, at the Boston Military Hospital, in 1781 (E. WARREN, in *Boston Med. and Surg. Jour.*, 1839, Vol. XX, p. 210); the patient recovered. Dr. R. BAYLEY (THACHER (J.), *American Medical Biography*, 1828, Vol. I, p. 161), in 1782, successfully exarticulatad the arm at the shoulder. Surgeon W. BURD, of the British Navy (*Annals of Med. for the year* 1797, Edinburgh, 1798, Vol. II, p. 282), exarticulated, on May 3, 1796, the arm of J. Moirieton, a French officer, shot in the right shoulder; the patient was discharged, cured, August 17, 1796. LARREY (D. J.) (*Mém. de chir. mil.*, 1812, T. II, 167) remarks: "Il s'en est présenté dix-neuf, qui ont nécessité l'amputation du membre à son articulation scapulo-humérale. Cette opération a eu un succès complet chez treize blessés; les six autres ont péri de la peste, ou des effets de la commotion portée par la cause vulnérante sur les organes intérieurs." FLEURY (*Observation sur une amputation du bras dans l'article*, in *Jour. de méd., chir., phar.*, 1806, T. XII, p. 437) exarticulated the arm for shot wound in a boy of 12; the patient recovered after consecutive ligation of the axillary artery and vein. LARREY (D. J.) (*Mém. de chir. mil.*, 1812, T. III, p. 361) states that after the battles of Wagram and Eslingen he performed fourteen exarticulations at the shoulder, of which twelve were successful; and (*l. c.*, T. IV, p. 432) remarks that, of a hundred and odd of his exarticulations at the joint, over ninety were successful. TROWBRIDGE (A.) (*Report of Extraordinary Cases of Amputation, read before the Med. Soc. of Jefferson County, New York*, in *The Medical Repository*, 1818, N. S., Vol. IV, p. 20) records two successful cases of exarticulation at the shoulder joint for shot injury. WHITRIDGE (J. B.) (*Case of Amputation at the Shoulder Joint*, in *The New England Jour. of Med. and Surg.*, 1816, Vol. V, p. 21) exarticulated the arm at the

Table XLII.

Numerical Statement of Eight Hundred and Fifty-two Cases of Amputations at the Shoulder Joint after Shot Fracture.

Operations.	Total cases.	Recoveries.	Fatal cases.	Results not specified.	Mortality rate, determined cases.
Primary	499	368	117	14	24.1
Intermediary	157	85	72	.....	45.8
Secondary	66	47	19	.....	28.7
Of unspecified date	130	91	28	11	23.5
	852	591	236	25	28.5

Primary Amputations at the Shoulder Joint.—Only operations practised within forty-eight hours from the reception of the injury are included in this category. The results, ascertained in all but fourteen of the four hundred and ninety-nine cases, are remarkably good, more than three-fourths of the patients having recovered. Undiscriminating opponents of conservative measures might seek to found on this datum a serious argument. The series is large, yet less numerous, by one-third, than the primary excisions. It would appear that the well-known indications for primary exarticulation,—viz: a shot fracture of the upper extremity of the humerus, with lesion of the vessels or nerves; or, secondly, a fracture high up, with splintering extending below the insertions of the latissimus dorsi and great pectoral,—were not invariably respected; but, for the most part, the cases were well chosen, were such, in fact, as admitted of no alternative but ablation of the limb.

shoulder joint in a soldier of the 2d Artillery, wounded at Stoney Creek, Upper Canada, June 6, 1813; the patient died five weeks after the operation. Guthrie (G. J.) (*A Treatise on Gunshot Wounds*, 1827, 3d ed., p. 469) tabulates thirty-eight cases of amputation at the shoulder joint—nineteen primary and nineteen secondary; sixteen fatal and twenty-two recoveries. Larochie (*Rel. chirurg. des événemens qui se sont passés à Lyon. etc.*, in *Rec. de mém. de méd.*, 1835, T. XXXVII, pp. 102, 108) records two cases of amputation at the shoulder for shot injury; one patient recovered—the other perished. Pinkney (N.) (*Report of some Operations performed during the late Cruise in the Pacific*, in *Am. Jour. Med. Sci.*, 1846, N. S., Vol. XII, p. 332) reports a fatal case of amputation at the shoulder joint for shot injury, at Callao, in June, 1843. Peaslee (E. R.) (*New York Jour. of Med.*, 1853, Vol. X, p. 297) reports the case of a man who shot himself accidentally in 1845; Dr. Peaslee amputated at the shoulder; recovery. Dr. E. Jennings (see letter to the editor of the *Annalist*, 1847, Vol. I, No. XXIII, p. 538) amputated the arm at the shoulder joint in a case of shot wound of the axilla; secondary hæmorrhage and death ensued. Dr. John Watson (*Amputation at the Shoulder Joint*, in the *Annalist*, 1847, Vol. I, No. XVI, p. 371) exarticulated the arm at the shoulder joint, in 1847, in a case of injury of the right arm and hand, caused by the premature discharge of a cannon; the patient died. Tripler (Ch. S.) (*Case of Secondary Hæmorrhage after Amputation at the Shoulder*, in *New York Jour. of Med.*, 1849, N. S., Vol. III, p. 41) exarticulated the arm of a private of the 2d Infantry, wounded at Cherubusco, August 20, 1847—recovery. Eve (P. F.) (*Southern Med. and Surg. Jour.*, 1848, Vol. IV, N. S., p. 663) amputated, for shot injury, the arm of a black boy at the shoulder joint—recovered. Huguier (*Des plaies d'armes à feu. Communications faites * * par MM. les Docteurs Baudens, Roux, etc.*, 1849, p. 143), in 1848, twice removed the arm at the shoulder joint for shot wounds; both patients recovered. Massarenti (Minelli, *Frattura comminutira dell'omero. Disarticolazione scapula-omeral*, in *Bulletino dell science mediche*, Bologna, 1850, Ser. 3, Vol. XVIII, p. 191) exarticulated at the shoulder joint, in the case of a soldier, aged 31, shot through the shoulder; the patient recovered. May (J. T.) (*Cases of Amputation*, in *Am. Jour. Med. Sci.*, 1851, N. S., Vol. XXII, p. 327) records a fatal case of amputation at the shoulder in a man accidentally shot by a fowling piece, in December, 1850. Mr. Cock (*Lancet*, 1852, Vol. II, p. 84), at Guy's Hospital, in 1851, exarticulated the arm at the shoulder joint, in the case of a leather-dresser, accidentally shot in the shoulder; the man recovered. Boling (*Western Jour. of Med. and Sci.*, Vol. XIII, and *New York Jour. of Med.*, 1853, N. S., Vol. X, p. 21) exarticulated the arm for shot injury; patient died in six hours. Cochran (J.) (*A Case of Amputation at the Shoulder Joint*, in *The New York Jour. of Med.*, 1854, N. S., Vol. XIII, p. 43) successfully exarticulated the arm for shot injury, in the case of a young gentleman of South Brooklyn. Heyfelder (J. F.) (*Deutsche Klinik*, 1855, B, VII, S. 495) exarticulated the arm at the shoulder for shot wound of the right forearm, in the case of Wasili Rilkoff, aged 27, wounded April 29, 1855; the case terminated fatally. Heyfelder (J. F.) (*Deutsche Klinik*, 1858, B. X, S. 226) removed the arm at the joint in the case of A. Baum, accidentally shot in the shoulder, while hunting; the patient died. Sanborn (E. K.) (*Surgical Clinique at Castleton Med. College*, in *Boston Med. and Surg. Jour.*, 1859, Vol. LX, p. 35) exarticulated at the shoulder joint, in the case of a young man accidentally shot through the shoulder; the case terminated fatally. Irwin (B. J. D.) (*Amputation at the Shoulder Joint*, in *Am. Jour. Med. Sci.*, 1859, N. S., Vol. XXXVIII, p. 350), in September, 1858, successfully exarticulated the arm of S. St. John, aged 24, shot in the shoulder by Mexicans. Duffee (W. J.) (*Amputation at the Shoulder Joint; Gunshot Wound*, in *Philadelphia University Jour. of Med. and Surg.*, Vol. XII, 1869, p. 394), in 1859, successfully exarticulated the arm at the shoulder for shot injury. Irwin (B. J. D.) (*Gunshot Wound of Arm; Amputation at the Shoulder Joint*, in *Am. Jour. Med. Sci.*, 1861, N. S., Vol. XLII, p. 337) cites a case of exarticulation at the shoulder for shot injury; the patient died. Miner (J. F.) (*Clinical Remarks upon Surgical Cases in the Buffalo General Hospital—Gunshot Wound—Amputation at the Shoulder Joint*, in *Buffalo Med. and Surg. Jour.*, August, 1864, Vol. IV, p. 378): a young lad, shot through the upper portion of the right arm; recovery without accident. In *Circular* 3, S. G. O., 1871, pp. 188–189, are reported three cases of amputations at the shoulder joint for shot injury, by Assistant Surgeons D. L. Huntington and C. Smart, U. S. A., and Dr. Owens, of Lynchburg. The two former were successful; the latter terminated fatally. Black (J. J.) (*Notes of some Surgical Cases*, in *The Western Lancet*, 1874, Vol. III, p. 291) exarticulated, in 1873, the arm at the shoulder for accidental shot injury; the patient recovered.

§ *Successful Operations.*—The details recorded regarding the three hundred and sixty-eight cases of this group are very scanty, consisting, for the most part, of little more than minutes of the injury and operation at field stations, notes of entrance and discharge from general hospitals, and reiterations of the facts by pension examiners. A few illustrations will precede the tabular enumeration of the cases:

Case 1585.—Captain E. L. Severn, Co. K, 96th Pennsylvania, aged 27 years, was wounded at Spottsylvania, May 10, 1864. Amputation at the shoulder joint was performed by Surgeon D. W. Bland, 96th Pennsylvania, who reported: "The wound was caused by the explosion of a case-shot, fired from the guns of the enemy while the command were resting in line of battle. The shot wounded seven men, four of whom died in a few hours. The captain was brought to the rear immediately, and expressed a desire to have me sent for, and if an operation was to be performed I should do it. I had been detailed as Medical Inspector of the Corps, and felt some hesitancy in leaving my regular duties to perform an operation; however, I examined the wound and found the entire humerus completely comminuted, involving the elbow joint. A portion of the shell had passed through the top of the shoulder, carrying with it a considerable portion of the clavicle and superior part of the scapula. The subject was all that could be desired for a capital operation—young, perfect health, and strictly temperate. After consulting with several medical officers of the corps, the unanimous conclusion was for immediate removal of the arm at the shoulder joint, and as much of the clavicle and scapula as was seriously involved. Assistants were selected and assigned their respective duties; the patient was placed under the influence of chloroform, and I proceeded to remove the arm at the shoulder joint by making the superior flap from the body of the deltoid muscle, disarticulating the head of the bone, and cutting the lower flap from the muscle and integument on the inner side of the arm; ligatures were applied and all hæmorrhage arrested. I then enlarged the wound over the clavicle by cutting in the direction of the bone, and after carefully removing the loose spiculæ of bone I sawed off either end of the clavicle, there remaining about four inches of this bone. I then removed the fragments of the superior part of the scapula, cutting away all loose and damaged integument. I closed the wound over the clavicle and scapula by the interrupted suture. The removal of so large a quantity of bone and integument above the shoulder joint offered a fine opportunity for the escape of all secretions through the joint and at the most dependent portion of the flaps, thus very materially favoring a speedy and successful cure. At the completion of the operation, I administered one ounce of brandy with one grain of morphia. The operation took place in the midst of a dense wood, at five o'clock P. M., with the light from a half dozen candles. At midnight the wounded were loaded for Fredericksburg, and this patient, with hundreds of others seriously wounded, was sent twenty miles over corduroy roads, before the wound was examined or his condition inquired about. The discouraging circumstances under which the first instalment of wounded were sent to Fredericksburg are too fresh in the memory of every one to recount them. In sixty hours after the operation, the wound was dressed, and the subject made as comfortable as circumstances would permit; everything went favorably from this time on, and at the end of three weeks he was sent to Washington and placed in the Officers' Hospital, at Georgetown, under the care of the late Dr. Ducachet. This gentleman told the captain that he would get well, but assured him that he was one case out of ten thousand, remarking that it was the most extensive operation that ever came under his care. The captain recovered entirely, and is, to-day, enjoying good health, using his left hand and arm with about the same facility he used his right. The amount of discharge was considerable, but at no time was there any indication of the formation of abscesses. The opening formed by the exit of the ligatures was the drain for all secretions, and everything went on toward a rapid and successful cure." This officer was discharged from service August 17, 1864, his disability being rated as total and permanent, and was pensioned from that date. On March 22, 1867, Dr. Bland contributed a photograph of his patient, which is copied in the wood-cut (Fig. 477), and stated: "The patient is at present superintending a colliery and enjoys excellent health."

Fig. 477.—Stump after primary amputation at the shoulder joint.

Case 1586.—Private A. E. H———, Co. F, 1st Maine Heavy Artillery, aged 21 years, was wounded at Yellow House, Virginia, October 2, 1864, and was sent to a Second Corps hospital. Surgeon O. Evarts, 20th Indiana, noted: "Right arm fractured by shell. Amputation at shoulder joint." The patient was sent north, and was treated in hospitals at Beverly and Bangor, and was discharged from service from the latter place, August 30, 1865. Acting Assistant Surgeon J. S. Waggoner recorded: "Shell wound of right arm; amputation at the joint; nearly healed, with occasional discharge from a small orifice." The specimen (Fig. 478) was contributed by the operator, Surgeon D. S. Hays, 110th Pennsylvania. It consists of "the upper part of the right [the catalogue of 1866, p. 90, has it, inadvertently, the left] humerus amputated at the shoulder joint. The inner portion of the epiphysis is broken; an oblique fracture runs directly through the head and surgical neck, and several fissures extend over the articular surface." The Bangor Examining Board, Drs. R. K. Jones, J. C. Weston, and E. F. Sawyer, April 1, 1874, reported: "The limb was carried away by a shell wound, with the end of the acromial process of the scapula and probably the glenoid cavity of the scapula; the coracoid remains. The scar lies horizontally across the seat of shoulder; it is very sensitive. He wears a large shoulder pad, and a bandage to support the shoulder." This pensioner was paid June 4, 1874.

Fig. 478.—Shot fracture of the right acromion and head of humerus. *Spec.* 4115. ½.

While, for the most part, the amputations at the shoulder were practised for fracture

implicating the articular surfaces, and attended by grave lesions of the soft parts in the vicinity, there were not a few instances of exarticulations for fractures of the diaphyses by small projectiles, where extensive longitudinal fissuring existed:

Case 1587.—Private *D. S Doggett*, Co. F, 35th Virginia, was wounded at Brandy Station, June 9, 1863. He was sent to Lincoln Hospital, at Washington. Acting Assistant Surgeon B. P. Brown forwarded the specimen (*Cat. Surg. Sect.*, 1866, p. 91, *Spec.* 1234), represented by Fig. 2, Plate XLVI, with the following report: "Wounded in the right arm by a pistol ball passing from before backward through the humerus, about three inches below the head, producing considerable comminution, and lodging just beneath the integument at the lower border of the axilla. He came into this hospital, Ward 16, June 11, 1863. The arm was amputated at the shoulder joint, June 11th, at three o'clock P. M., by Surgeon G. S. Palmer, U. S. V." The specimen is described in the Catalogue as: "The right humerus amputated at the shoulder joint, for a compound fracture by a large pistol ball, at the upper thirds." The patient was transferred to Hammond Hospital, Point Lookout, on November 27, 1863, and assigned for exchange in March, 1864.

In the larger proportion of cases, however, the operation was practised on account of injuries produced by large projectiles—solid, or hollow and explosive:

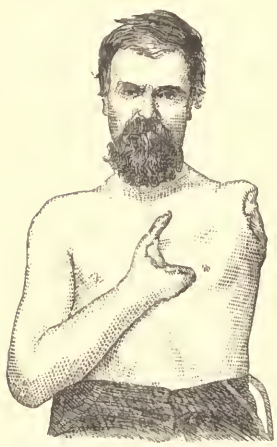

Fig. 479.—Cicatrices after amputations at left shoulder, and of fingers of the right hand. [From a photograph.]

Case 1588.—Corporal J. J. F——, Co. K, 73d Indiana, aged 28 years, was wounded at Day's Gap, Alabama, April 30, 1863, while on a raid. The entire brigade was captured near Rome, Georgia, on May 3d. The regimental medical officers becoming separated from the men, there is no record of the patient until his discharge at Camp Morton, Indiana, October 19, 1863. Surgeon Seth T. Myers, 73d Indiana, certifies: "Discharged on account of a wound by a grapeshot, causing the left arm to be amputated at the shoulder joint, and the removal of the entire right hand with the exception of the thumb." This soldier was pensioned from the date of his discharge. His company commander certified: "* * his left arm was badly shattered near the shoulder by a grapeshot, and had to be amputated at the shoulder joint, and that at the same time and place his right hand was taken off, except his thumb, with shot or shell * * ." Examiner Luther Brusie, of Laporte, Indiana, February 5, 1866, furnished an ambrotype of the pensioner, represented by the cut (Fig. 479), and the following description: "The left arm was amputated at the shoulder joint. There is a total loss of all the fingers of the right hand, and a loss of all the metacarpal bones of the same hand except that of the little finger, and anchylosis of wrist." The pensioner applied for commutation for an artificial limb in 1870. He states that the operation was performed on the field by Assistant Surgeon W. M. Spencer, 73d Indiana, Dr. Peck, and Surgeon Seth T. Myers, immediately after the injury.

Case 1589.—Private T. Cole, Co. B, 5th Michigan, aged 44 years, was wounded at the Wilderness, May 5, 1864. Surgeon O. Evarts, 20th Indiana, in charge of a Second Corps field hospital, reported a "compound fracture of the arm," and "amputation May 5th." After treatment in Lincoln Hospital, Washington, the patient was furloughed, on June 21, 1864. On July 19th, he entered St. Mary's Hospital, Detroit. Acting Assistant Surgeon D. O. Farrand noted: "A gunshot wound of the right shoulder, passing through the surgical neck of the humerus. Flap amputation at shoulder joint; removal of the head of the humerus, in a field hospital, May 6th, by Surgeon Henry F. Lyster, 5th Michigan. The humerus was badly shattered. Progress was slow; the wound continued to discharge for a long time; simple dressings were employed. September 30th, the patient still under treatment." The patient was discharged from service October 1, 1864, and pensioned on account of "a gunshot fracture of the head of the right humerus and the lower border of the right scapula, which necessitated the amputation of the arm at the shoulder joint." The disability is rated total. The pensioner was paid December 4, 1874.

Fig. 480.—Cicatrix after an exarticulation at left shoulder, as it appeared a year after the operation.

Case 1590.—Sergeant J. Mills, jr., Co. D, 8th Vermont, aged 21 years, was wounded at Winchester, September 19, 1864. Assistant Surgeon J. Homans, jr., U. S. A., from a Nineteenth Corps field hospital, reported: "Gunshot fracture of the left arm; amputation at the shoulder joint; favorable." On the following day he entered the depot hospital at Winchester, and was transferred to Frederick, November 12th. Acting Assistant Surgeon W. B. McCausland noted: "Wounded by a minié ball. Admitted into this hospital from Winchester for amputation of the left arm at the shoulder joint, the result of a gunshot fracture of the left humerus, upper third, involving the joint. Arm amputated September 20, 1864, at Morgan's Mills, Virginia, by Assistant Surgeon B. A. Fordyce, of the 16th New York. Flap operation. Condition at time of operation good. November 12th, wound perfectly healthy; simple dressings applied. November 20th, wound nearly healed; discharge slight; simple dressings continued. November 28th, transferred to Brattleboro'. On leaving the hospital he was in perfect health, with the exception of a very slight discharge from the wound." The patient, after treatment in hospitals at Burlington and Montpelier, was finally discharged from service, October 12, 1865, and pensioned. The disability was rated total. This pensioner was paid March 4, 1875. Dr. H. Janes, formerly surgeon of volunteers, of Sloan Hospital, Montpelier, contributed the photograph of the patient, represented by the cut (Fig. 480), taken at the date of the soldier's discharge.

Some examples of the character of the fractures of the humerus in the cases in which amputation was performed appear on the succeeding page.

CASE 1591.—Private G. H———, Co. D, 1st Massachusetts Heavy Artillery, aged 46 years, was wounded at the engagement near the Weldon Railroad, October 2, 1864. The case was registered at the 3d division, Second Corps, field hospital as a gunshot fracture of the arm. Surgeon O. Evarts, 20th Indiana, amputated at the shoulder joint, and sent to the Museum the pathological specimen represented by the wood-cut (FIG. 481). The patient subsequently entered Carver Hospital, at Washington. Surgeon O. A. Judson, U. S. V., noted: "Admitted October 31st, with gunshot wound of the right arm. A conoidal ball passing, traversed through from before backward, producing compound comminuted fracture of the upper third of the humerus. Amputation of the right arm at the shoulder joint by the U-flap method was performed on the field October 3d. The result was favorable; the wound healing nicely upon admission. Treatment, simple dressing. Constitutional state, good. There has been no unfavorable complication in this case. Wound doing remarkably well at date of transfer, November 30, 1864." The specimen consists of "the upper half of the right humerus. The bone has been shattered throughout the upper third of its shaft, and was amputated at the joint."—(*Cat. of Surg. Sect.*, A. M. M., 1866, p. 91.) The patient was treated in hospital at Readville, Massachusetts, until June 15, 1865, when he was discharged and pensioned. The records of the Pension Bureau do not furnish evidence as to the present condition of the stump. The pensioner was paid December 4, 1874. He received an artificial arm from Mr. Marvin Lincoln, June 3, 1865. The cicatrix was then in good condition.

FIG. 481.—Upper extremity of the right humerus shattered by shot. *Spec.* 4124.

CASE 1592.—Private H. K. Atkinson, Co. G, 85th Pennsylvania, aged 47 years, was wounded in front of Petersburg, September 1, 1864. He was admitted to a Tenth Corps field hospital, and was operated on by Surgeon C. M. Clark, 39th Illinois, who reported: "Wounded by a spherical ball, twelve pounder. The ball struck the right arm midway between the elbow and shoulder joints, completely denuding the extensively fractured bone of its muscles and integuments, except in the axillary region, and a small strip of skin on the anterior surface of the arm. The artery, vein, and nerves were left intact, but exposed, and, to some degree, isolated from each other. The shock to the system had been extreme; however, the man managed to walk with assistance to my quarters, distance one-half mile. After giving him stimulants and some nourishment, a careful examination was made. The humerus had been carried away to the extent of some six inches from the head of the bone, except some few pieces that adhered to the remaining tissue. After consultation with Surgeon J. Westfall, 67th Ohio, I proceeded to remove the arm, after ligating the axillary artery; then, finding the head of the bone to be implicated, the capsular ligament was divided and it removed. The flap was made entirely from the axillary region, and was brought up so as to unite with the severed portion of integument over the acromial region. No anæsthetic was given. The flap was secured by silk sutures and adhesive straps, then cold-water dressing and a supporting bandage. He was put to bed in the field hospital, and remained under my care for two weeks, gradually improving in strength and the wound healing rapidly. At the expiration of this time he was sent to General Hospital, where he entirely recovered, and when I last heard from him he was at home and well." The patient was admitted to Hampton Hospital, Fort Monroe, September 25, 1864, and was subsequently treated at Grant Hospital, New York, and at Newark, New Jersey. He was finally discharged the service, and pensioned November 22, 1864. The pensioner declares: "A spherical case shot removed the arm from the shoulder." The pensioner was paid December 4, 1874.

FIG. 482.—Shot comminution of the right humerus in a young subject. *Spec.* 123.

CASE 1593.—Private C. W———, Co. K, 16th Massachusetts, aged 19 years, was wounded at Spottsylvania Court-house, May 9, 1864. Surgeon C. C. Jewett, 16th Massachusetts, amputated at the shoulder joint, on the field, and forwarded the specimen, represented by the wood-cut (FIG. 482), to the Museum. The patient was admitted to the 3d division hospital, Alexandria, on May 13th. Surgeon Page, U. S. A., recorded: "Gunshot fracture of right humerus. Immediate amputation at the shoulder joint. Transferred June 26, 1864, to Portland, Maine." The specimen consists of "the upper third of the right humerus, after disarticulation for fracture, with comminution in the upper third. The epiphysis has become completely separated in the preparation."—(*Cat. Surg. Sect.*, 1866, p. 92.) The patient was treated in Cony Hospital, Augusta, until July 12th, and then transferred to hospital at Readville, Massachusetts, under the care of Acting Assistant Surgeon J. Stearns, jr. He was discharged and pensioned November 19, 1864. The Brooklyn Board, Drs. M. K. Hogan, T. F. Smith, and J. F. Ferguson, August 19, 1874, certify: "Amputation of right arm at shoulder joint." The disability was rated total. The pensioner was paid March 4, 1875. He applied for commutation in lieu of an artificial limb.

CASE 1594.—Private L. W. H———, Co. I, 7th New Jersey, aged 27 years, was wounded at Spottsylvania, May 9, 1864. On the following day, amputation at the shoulder joint was performed by Surgeon C. C. Jewett, 16th Massachusetts. The specimen represented by the adjacent wood-cut (FIG. 483) was forwarded to the Museum by the operator. On May 14th, the patient entered King Street Hospital, Alexandria. Surgeon E. Bentley, U. S. V., recorded: "Shell wound of right arm. Amputation at shoulder joint by antero-posterior flaps. Patient says that the joint was badly fractured. Water dressings applied. Wound of amputation suppurated profusely. Stimulants and opiates given occasionally. Ligatures all away, and stump nearly healed, at time of transfer to Philadelphia, June 28, 1864." The patient was subsequently treated in the Christian Street and Broad and Cherry Streets Hospitals at Philadelphia, and was discharged and pensioned October 7, 1864. The pensioner declares "he received a wound from a shell, shattering the right arm, from the shoulder joint to the wrist, so badly that the next day the whole arm had to be removed." Surgeon C. Lehlbach, 7th New Jersey, describes the fracture as inflicted by a canister-shot. This pensioner was paid December 4, 1874.

FIG. 483.—Comminution by shell fragment of upper half of right humerus. *Spec.* 2.63.

Two of the three following cases exemplify painful cicatrices from neuromatous enlargements. Two of them are illustrated by cuts from photographs prepared after the cicatrization of the mutilation; the second of these shows well the elevation of the mutilated shoulder, which is so characteristic of this amputation. It does not appear that the blood-vessels or nerves were implicated in either of these three cases:

FIG. 484.—Cicatrix after an amputation at the shoulder joint in a case in which the glenoid cavity was implicated. [From a photograph.]

CASE 1595.—Private R. M. Armsden, Co. I, 11th Vermont, aged 23 years, wounded at Cedar Creek, October 19, 1864, entered a Sixth Corps field hospital the same day. Surgeon S. F. Chapin, 139th Pennsylvania, noted: "Gunshot wound of left shoulder joint. Amputation at the shoulder joint." The patient subsequently received treatment in hospital at Philadelphia, Brattleboro', and Montpelier. In 1875, Dr. H. Janes, formerly surgeon of volunteers, contributed a photograph of this man, made at the Sloan Hospital, and copied in the adjacent wood-cut (FIG. 484), and added further particulars of the case: "Wounded by a minié ball, which entered in front of the inner side of the head of the left humerus, passed through, and emerged behind at the outer border of the scapula, fracturing it. The arm was amputated on the field, twenty-six hours after the injury, at the shoulder joint. From the field he was sent to Philadelphia, being six days on the journey. He was transferred from Philadelphia to Brattleboro', February 1, 1865, and from Brattleboro' to Montpelier, February 28, 1865. The stump healed without accident before he left Philadelphia. The entrance wound closed about the first of April, but the exit wound remained open until August 1, 1865, when a small fragment of the scapula was removed. The sinus closed in a day or two. He was discharged from service August 12, 1865. Stump tender from enlarged nerves. General health good. Disability two-thirds." This soldier was pensioned from the date of his discharge, and was paid March 4, 1874.

CASE 1596.—Lieutenant J. D. Stokes, Co. F, 140th Pennsylvania, was wounded at Gettysburg, July 2, 1863. He was at once admitted to the regimental hospital. Surgeon J. Wilson Wishart, 140th Pennsylvania, reported: "Compound comminuted fracture of the head and neck of the right humerus, involving the shaft, by a conoidal ball. Amputation of shoulder joint by deltoid flap, under chloroform. The reaction from the shock was slow and imperfect, and on this account the operation was delayed until the 4th. He rejoined his regiment in January, 1864, with a good stump, but suffering from neuralgia, with enlargement of one of the nerves of the axillary plexus." This officer died September 17, 1864, and, on the widow's claim for pension, David McKinney, M. D., attested that he was the attending physician of Lieutenant Stokes, and that "the wound received by said Stokes was in his right arm, which was amputated at the shoulder joint. That upon his return home he was much reduced and his whole physical system much disordered, a condition superinduced by the suffering from the wound aforesaid. That for some months he continued prostrate and suffered intensely from the wound aforesaid, but subsequently recovered to such a degree as to be able to travel about, and in some measure direct his business affairs. He, however, suffered greatly from his wound at all times, and during the months of May, June, and July, 1864, the suffering from this cause became so great as to be beyond control by opiates and medicines that could be prudently administered, and rendered an operation necessary to remove the irritating cause. A second operation was, therefore, after due consideration and advice of eminent surgeons, performed by Drs. Dickson, Ritter, and others, of the City of Pittsburg, who removed a portion of the flesh and a mass of nerves from the cicatrix or face of the wound, which appeared to be the cause of the intense suffering. For a time he seemed to improve; the intense suffering was relieved, but his system was so far reduced by former suffering and medicines taken to relieve the same as to be unable to rally and recover from the operation, and in a few days he began to sink; gangrene set in, and it was impossible to subdue it, and he died about three weeks after the operation." There appears to have been no autopsy in the case.

FIG. 485.—Cicatrix after amputation at the shoulder by transfixion. [From a photograph.]

CASE 1597.—Private A. C. Chase, Co. C, 17th Vermont, aged 45 years, was wounded at Peeble's Farm, Virginia, September 30, 1864. He was sent to Washington from the field, and entered Lincoln Hospital. Surgeon J. C. McKee reported: 'Admitted October 8th. Amputation at the shoulder, by the external lateral flap method, had been performed on the field, September 30th, for a shot fracture of the upper third of the humerus, near the joint." The patient was transferred to Sloan Hospital, Vermont, in December. Dr. H. Janes, formerly surgeon U. S. V., contributed, in 1875, a photograph, represented by the annexed cut (FIG. 485), with the following history of the case: "This soldier received a gunshot wound, fracturing the upper third of the left humerus. The arm was amputated at the shoulder joint, on the field, twelve hours after injury. The wound was slow in healing, and did not completely close until about six months after the operation. No accidents. Admitted to hospital at Montpelier, December 2, 1864. Discharged from the service June 12, 1865; disability two-thirds." This soldier was pensioned from the date of his discharge, and was paid December 4, 1874. He states that his arm was amputated in a Ninth Corps field hospital, and that he is ignorant of the name of the operator. Surgeon P. O. M. Edson and Assistant Surgeon J. H. Spohr were the medical officers of the regiment, which was attached to the 2d division of the Ninth Corps. Surgeon J. Harris, 7th Rhode Island, Surgeon W. A. Webster, 9th New Hampshire, and Surgeon J. S. Ross, 11th New Hampshire, were the principal operators in the Division at the period referred to.

One or two further examples may be adduced in illustration of the osseous lesions for which these amputations were performed for the most part. It will be observed that

whether the head or the shaft be fractured by musket balls, the splintering rarely crosses the epiphyseal line. Unless they are both shattered by a large projectile, or a small missile impinges directly at their junction, the epiphysis and diaphysis are seldom simultaneously fissured:

Case 1598.—Private S. B———, Co. B, 88th Pennsylvania, aged 28 years, was wounded at North Anna, May 25, 1864. Surgeon J. Rawlings, 88th Pennsylvania, reported: "Gunshot fracture of the left humerus; amputation at the shoulder joint the following day." On May 29th, this soldier was transferred to Emory Hospital, Washington, where Surgeon N. R. Moseley, U. S. V., noted that "amputation of the left arm at the shoulder joint, by the oval flap method, was performed on the field. Treatment: Tonics and generous diet. June 30th, is still in hospital, improving gradually." Transferred, convalescent, to Philadelphia, to Christian Street Hospital, August 18th. This soldier was discharged November 3, 1864, and pensioned. Dr. Rawlings contributed to the Museum the preparation of the shattered head of the humerus, a view of which is presented in the annexed wood-cut (Fig. 486). Assistant Surgeon A. A. Woodhull, U. S. A. (*Cat. Surg. Sect.*, p. 90), remarks of it: "A conoidal ball, which has reversed itself, is embedded in the head of the bone, surrounded with shreds of clothing. The missile entered from the rear, shattered the greater tuberosity, and fractured the articular surface into several fragments. The fracture does not extend below the surgical neck." On July 18, 1870, this pensioner applied for and received commutation in lieu of an artificial limb, in accordance with the act making provision for mutilated soldiers. He certified that the cicatrix was sound at that date. He received his pension December 4, 1873.

Fig. 486.—Posterior view of upper extremity of left humerus with an embedded reversed ball. *Spec.* 4125.

There were six instances, among the three hundred and sixty-eight successful primary exarticulations at the shoulder, in which portions of the acromial extremity of the clavicle, or fragments of the processes or body of the scapula, were removed at the time of amputation. All of these six cases were examples of comminution of the bones by large projectiles. The following is an illustration:

Case 1599.—Sergeant G. W. Mears, Co. A, 6th Pennsylvania Reserves, aged 21 years, was wounded at Mine Run, November 27, 1863. This case is referred to on the Monthly Report by Assistant Surgeon J. K. Corson, of the regiment, as follows: "One case of shell wound of the left shoulder, in which the acromial process of the scapula and a portion of the clavicle and head of the humerus were much shattered. Amputation at the shoulder joint was performed twenty-four hours after the reception of the wound, and the fragments removed. Operator, Surgeon Charles Bower, 6th Pennsylvania Reserves, Chief Surgeon First Brigade, 3d division, Fifth Army Corps." The specimen, represented by the cut (Fig. 487), is described in the 1866 Catalogue, p. 92, as follows: "The upper third of the left humerus, which was disarticulated. The head and surgical neck were shattered by a conoidal ball, the fractures extending four inches down the shaft. Two and a half inches of the acromion, mounted with the specimen, was probably removed at the time of operation. Received from the Army of the Potomac." The patient entered Fairfax Hospital, Alexandria, December 4th, and was sent thence to Philadelphia, in May, 1864, and after treatment in Christian Street and Broad and Cherry Streets Hospitals, was finally discharged the service, June 11, 1864, and pensioned. His disability was rated total. He was paid June 4, 1874. The pensioner applied for commutation in lieu of an artificial limb, November, 1870, and stated that the cicatrix was then healthy. He had never worn any prothetic apparatus.

Fig. 487.—Lesions consequent on a fracture of the left humerus by a shell fragment. *Spec.* 2531.

The method of operating that was most general was by transfixion and raising a large external flap, opening the articulation by the first incision, disarticulating, and then cutting the vessels and nerves in a short internal flap. But the oval methods of Larrey, Guthrie, and Scoutetten were also very often employed. In most of the cases the continuity of the humerus was destroyed near the shoulder, and strong-jawed forceps were useful in seizing the head of the humerus and turning it to facilitate its exarticulation. The importance of raising the arm from the side, that the operator or an assistant might have a hand in the axilla, to grasp the axillary artery at the instant of its division, was generally recognized. There was rarely much trouble in controlling bleeding. Indeed, primary exarticulation[1] at the shoulder for injury is a very simple operation. As much cannot be said of the intermediary and secondary operations.

[1] Pirogoff (N.) (*Grundzüge der Allgemeinen Kriegschirurgie*, u. s. w., S. 771) is inclined to regard amputation at the shoulder joint for shot injury as a safer plan than excision; and claims that, in one regard, the latter is inferior even to the expectant or conservative treatment, since it is "even more frequently complicated by rapidly increasing acute purulent œdema."

TABLE XLIII.

Summary of Three Hundred and Sixty-eight Cases of successful Primary Amputations at the Shoulder for Shot Injury.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Abbott, Wm., Pt., A, 58th Ohio.	Dec. 29, 1862.	Left humerus splintered by a musket ball.	Dec. 29, 1862.	Amputation at the shoulder by external flap method.	Discharged April 18, 1863, and pensioned.
2	*Abraham, S. F.*, Pt., D, 56th Virginia.	June 3, 1864.	Fracture of surgical neck of the right humerus.	June 3, 1864.	Amputated, by Surgeon Rives, 56th Virginia.	Furloughed August 10, 1864.
3	Adams, J., Pt., 4th U. S. C. T., age 29.	Sept. 29, 1864.	Fracture of upper third of left humerus.	Oct. 1, 1864.	Amput'd by Lisfranc's method, by Surgeon A. H. Cowdrey, 37th U. S. C. T.	Discharged November 10, 1865; pensioned.
4	*Adams, S. M.*, Pt., K, 12th Alabama, age 30.	July 1, 1863.	Shot through right shoulder, extensive comminution of humerus.	July 2, 1863.	Disarticulated at the shoulder by double flaps.	Recovered; paroled November 12, 1863.
5	Albertson, R., Pt., I, 14th Michigan.	Mar. 19, 1865.	Fracture of right humerus	Mar. 19, 1865.	Amputation, by Surgeon E. Batwell, 14th Michigan.	Discharged May 16, 1865, and pensioned.
6	Amsden, R. M., Pt., I, 11th Vermont, age 23.	Oct. 19, 1864.	Shot wound of the left shoulder joint, with much laceration.	Oct. 20, 1864.	Amputated after the battle at Cedar Creek.	Disch'd Aug. 12, 1865; pensioned.
7	Angel, H., Pt., 57th Ohio, age 19.	Sept. 2, 1864.	Wound of right arm by a cannon ball.	Sept. 2, 1864.	Amputation at the shoulder by the oval method.	Transferred to V. R. Corps, March 29, 1865; discharged June 30, 1865; pensioned.
8	Ashcroft, J., Sergt., K, 64th Ohio, age 31.	Nov. 25, 1863.	Shot fracture of head and portion of shaft of right humerus.	Nov. 27, 1863.	Amputated, by Surg. A. McMahon, 64th Ohio.	Disch'd Oct. 12, 1864; pensioned. Died Jan. 21, 1869, of "tubercular consumption resulting from the wound."
9	Atchinson, H. H., Pt., G, 85th Pennsylvania, age 47.	Sept. 1, 1864.	Fracture of middle third of right humerus by a 12-lb. spherical shot; bone denuded; artery, vein, and nerve intact.	Sept. 1, 1864.	Amputated, by Surgeon C. M. Clark, 30th Illinois; flap made entirely from axillary region.	Discharged November 22, 1864; pensioned.
10	Austin, A., Pt., D, 104th New York.	Aug. 30, 1862.	Laceration of the right arm, by cannon shot.	Aug. 30, 1862.	Amputated at the shoulder by external flap.	Disch'd Oct. 3, 1862; pensioned.
11	*Bagby, T. B.*, Pt., C, 44th Virginia, age 19.	July 2, 1863.	Shot fracture of right humerus, shoulder joint involved.	July 3, 1863.	Amputated at the shoulder by Lisfranc's method.	Recovered; exchanged September 14, 1863.
12	Baker,* E., Pt., G, 19th Kentucky, age 21.	May 1, 1863.	Upper third of right humerus fractured; bone shattered.	May 1, 1863.	Amputated by Larrey's method, with an anterior V flap.....	Discharged September 2, 1863; pensioned.
13	*Ballard, J. A.*, Pt., K, 17th Alabama, age 25.	April 6, 1862.	Shot fracture of right humerus, high up.	April 7, 1862.	Disarticulation at the shoulder by transfixion.	Recovered; sent to military prison April 27, 1862.
14	Banks, G., Pt., E, 44th New York.	May 27, 1862.	Shot fracture of the left arm...	May 29, 1862.	Amputation at the shoulder by Dupuytren's method.	Discharged September 23, 1862; pensioned.
15	Barber, G. W., Pt., E, 9th New Hampshire, age 23.	Dec. 13, 1862.	Shell fracture of left humerus, with great destruction of soft parts.	Dec. 13, 1862.	Amputation at the shoulder, by Surg. W. A. Webster, 9th New Hampshire.	Disch'd Mar. 13, 1863; pensioned.
16	Barbor, R., Pt., C, 42d Indiana.	May 30, 1864.	Shot fracture of left shoulder joint.	May 30, 1864.	Disarticulated, by Surg. B. F. Miller, 2d Ohio.	Disch'd Oct. 27, 1864; pensioned.
17	Barth, G., Pt., F, 4th Ohio...	May 2, 1863.	Shot fracture of left humerus, near the joint.	May 2, 1863.	Amputated at the shoulder, by Surg. C. S. Wood, 66th N. York.	Disch'd June 22, 1863; pensioned.
18	*Baughan, M. T.*, Lieut., A, 5th Virginia, age 31.	July 3, 1863.	Upper portion and neck of the right humerus shattered; chest injured.	July 3, 1863.	Amputated at the shoulder, by a Confederate surgeon.	Recovered; exchanged March 3, 1864.
19	*Bean, C. M.*, Lieut., G, 5th Texas, age 24.	July 3, 1863.	Shot fracture of the upper portion of the right humerus.	July 3, 1863.	Amputation at the shoulder by the flap method; abscesses formed.	Recovered; exchanged March 17, 1864.
20	Beck, J., Pt., I, 6th Connecticut, age 44.	Aug. 16, 1864.	Shot wound of right arm, with fracture of the humerus.	Aug. 17, 1864.	Disarticulation at the shoulder by the oval method.	Discharged September 4, 1864; pensioned.
21	Bell, A., Pt., A, 16th New York, age 29.	June 3, 1864.	Wound through left shoulder joint; humerus fractured.	June 3, 1864.	Amputation at the shoulder; flap method.	Disch'd Mar. 31, 1865; pensioned.
22	Bennett, R., Pt., F, 9th New Hampshire, age 18.	July 30, 1864.	Shot fracture of right shoulder	July 30, 1864.	Amputated, by Surgeon W. A. Webster, 9th New Hampshire.	Discharged January 20, 1865; pensioned.
23	Bernheisel, L., Pt., 5th Pennsylvania, age 25.	May 9, 1864.	Fracture of the upper third of right humerus by shell.	May 11, 1864.	Amputated at the shoulder, by Confederate Surg. Graham.	Disch'd May 1, 1865; pensioned.
24	Bertram, J., Sergt., H, 58th New York.	June 8, 1862.	Fracture of the left humerus at the surgical neck, with splintering.	June 8, 1862.	Amputated at the shoulder, by Surg. C. M. F. Muecke and Ass't Surg. C. Stein, 58th New York.	Disch'd Aug. 14, 1862; pensioned. Died January 15, 1874.
25	Bissell, E. B., Pt., K, 1st Vermont, age 20.	Oct. 27, 1864.	Right arm nearly severed close to the body by a cannon ball.	Oct. 27, 1864.	Amputated at the shoulder, by Ass't Surg. E. P. Fairman, 9th Vermont.	Disch'd July 25, 1865; pensioned.
26	Blackburn, W., Pt., D, 6th Wisconsin.	Feb. 6, 1865.	Shot fracture of upper third of left humerus.	Feb. 6, 1865.	Disarticulated at the shoulder by Larrey's plan.	Disch'd June 16, 1865; pensioned.
27	Blood, S. L., Pt., K, 11th Massachusetts, age 18.	May 5, 1864.	Right humerus fractured by a conoidal ball.	May 6, 1864.	Disarticulated at the shoulder; lateral flaps.	Disch'd July 25, 1865; pensioned.
28	Boethe, F., Pt., G, 1st Pennsylvania Reserve Artillery, age 34.	Feb. 7, 1864.	Fracture of head of right humerus; joint opened.	Feb. 9, 1864.	Disarticulated at the shoulder, by Surg. A. N. Dougherty, U. S. V.	Disch'd Nov. 18, 1864; pensioned. *Spec.* 2042, A. M. M.
29	Border, H., Pt., K, 133d Pennsylvania, age 18.	Dec. 13, 1862.	Shot wound of left arm, with comminution of bone.	Dec. 13, 1862.	Amputated at the shoulder, two hours after injury, by circular method.	Disch'd Mar. 27, 1863; pensioned.
30	Bowers, W., Pt., F, 5th U. S. Colored Troops, age 18.	Sept. 29, 1864.	Shot fracture of the left humerus and elbow joint.	Sept. 30, 1864.	Amputated at the shoulder, by Confederate Surg. Van Dell.	Disch'd June 8, 1865; pensioned.
31	Bowles, J. H., Pt., D, 1st Massachusetts.	Dec. 13, 1862.	Shell wound of the left arm in upper third.	Dec. 14, 1862.	Amputation, by Surg. J. M. Merron, 2d New Hampshire.	Disch'd Mar. 12, 1863; pensioned.
32	Box, J. F., Lieut., A, 147th New York, age 22.	July 3, 1863.	Shot wound through the left shoulder joint.	July 3, 1863.	Amputated at the shoulder by transfixion.	Discharged November 5, 1863; pensioned.
33	Boyd, J. H., Pt., E, 116th Illinois, age 19.	July 11, 1864.	Shot fracture of upper third of left humerus.	July 11, 1864.	Amputated at the shoulder, by Surg. A. C. Messenger, 57th Ohio.	Disch'd Oct. 24, 1864; pensioned.
34	Bralley, A. J., Sergt., E, 183d Pennsylvania, age 23.	June 18, 1864.	Shell wound of left arm, shattering the humerus.	June 18, 1864.	Amputated at the shoulder, by Surg. J. W. Wishart, 140th Pennsylvania.	Disch'd Oct. 12, 1864; pensioned.
35	Briant, G. R., Pt., A, 33d Indiana.	May 25, 1864.	Wound by a cannon ball; left arm shot away close to the shoulder.	May 26, 1864.	Amputated at the shoulder, by Surgeon R. F. Benee, 33d Indiana.	Disch'd Feb. 6, 1865; pensioned.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
36	*Brookins, J. B.*, Pt., B, 37th Georgia, age 22.	Nov. 30, 1864.	Shot wound of right arm and puncture of the humerus.	Dec. 2, 1864.	Disarticulation at the shoulder by the double flap method.	Transferred to Provost Marshal, for exchange, January 7, 1865.
37	Brown, G., Pt., K, 25th Ohio.	May 2, 1863.	Shell fracture of left humerus; laceration of soft parts.	May 3, 1863.	Amputation at the shoulder by the oval method.	Discharged November 18, 1863; pensioned.
38	Brown, G. L., Pt., G, 5th Massachusetts, age 28.	Mar. 29, 1865.	Fracture of head of humerus and acromial process by a fragment of shell.	Mar. 29, 1865.	Amputated by inner and posterior flaps, by Surg. W. Ingalls, 5th Massachusetts.	Disch'd Aug. 19, 1865; pensioned. Wound frequently breaks out and becomes a running sore.
39	Brown, J., Pt., E, 1st Maryland, age 33.	May 8, 1864.	Shot fracture of right humerus, with extensive fissuring and injury of vessels.	May 8, 1864.	Amputation at the shoulder by double flap method.	June 13th, secondary hæmorrhage, controlled by pressure on subclavian. Discharged May 23, 1864; pensioned.
40	Brown, P. J., Pt., I, 147th New York, age 25.	July 1, 1863.	Shot wound of left arm, the humerus splintered.	July 3, 1863.	Amputation at the shoulder, by a Confederate surgeon.	Promoted to lieutenant. Disch'd September 3, 1864; pensioned. Stump sound.
41	Brown, S., Pt., F, 7th Indiana, age 22.	May 6, 1864.	Shot fracture of upper third of right arm.	May 6, 1864.	Amputated at the shoulder, by Surgeon Geo. W. New, 7th Indiana.	Sent to his regiment and mustered out Sept. 20, 1864; pensioned.
42	Brown, T. M. G., Pt., F, 48th New York, age 33.	July 30, 1864.	Shot fracture of right humerus	July 30, 1864.	Amputation at the shoulder by antero-posterior flaps.	Discharged November 7, 1864; pensioned.
43	Burk, A., Pt., F, 87th Pennsylvania, age 22.	June 2, 1864.	Wound of right arm, with fracture of the humerus.	June 2, 1864.	Amputation at the shoulder by transfixion.	Disch'd Nov. 12, 1864; pensioned. "Stump very tender; neuralgic pains upon pressure."
44	Burke, J., Pt., A, 5th Maryland.	Sept. 17, 1862.	Shot fracture of left humerus, with lesions of soft parts.	Sept. 18, 1862.	Amputation at the shoulder by antero-posterior flaps.	Disch'd Jan. 12, 1863; pensioned. Neuralgia in stump.
45	Burkhart, S., Pt., B, 88th Pennsylvania, age 28.	May 23, 1864.	Ball shattered the greater tuberosity, fractured the articular surface, and lodged in head of the humerus.	May 24, 1864.	Amputated at the shoulder by oval flap operation, by Surg. J. W. Rawlings, 88th Pennsylvania.	Discharged November 3, 1864; pensioned. *Spec.* 4126, A. M. M.
46	Burnham, W. J., Corp'l, K, 5th Pennsylvania.	Nov. 2, 1862.	Shell wound of right arm, with fracture of the humerus.	Nov. 2, 1862.	Amputated at the shoulder, by Ass't Surg. J. C. Lyons, 56th Pennsylvania.	Disch'd May 25, 1863; pensioned.
47	Bussey, J. F., Pt., C, 87th Indiana, age 20.	June 18, 1864.	Shot fracture of right arm at shoulder.	June 18, 1864.	Amputated, by Surgeon C. E. Triplett, 87th Indiana.	Disch'd Nov. 2, 1864; pensioned. Pension Report says: "Two inches below shoulder joint."
48	Byers, J. K., Lieut., F, 121st Pennsylvania.	Dec. 12, 1862.	Shot wound through right arm and shoulder.	Dec. 14, 1862.	Amputated at the shoulder, by Surg. P. F. Whitehead.	Disch'd Oct. 14, 1863; pensioned.
49	Coll, D., Pt., Marine Corps, age 25.	May 22, 1864.	Shot wound of left arm, with comminution of the bone.	May 23, 1864.	Amputated at the shoulder, by Surg. Fletcher, U. S. A.	Disch'd Oct. 26, 1866; pensioned. Pension Board, March 29, 1873, certifies: "Large aneurism of subclavian above ligature."
50	Callahan, M., Pt., A, 30th Ohio, age 34.	July 22, 1864.	Shot wound of middle third of left arm, with splintering.	July 23, 1864.	Disarticulated at the shoulder by transfixion.	Disch'd Mar. 25, 1865; pensioned.
51	*Caswell, M. M.*, Corp'l, K, 23th Georgia, age 25.	Nov. 30, 1864.	Shot wound of left arm, the humerus shattered.	Dec. 1, 1864.	Amputation at the shoulder by antero-posterior flap.	Sent to Provost Marshal January 31, 1865.
52	*Catlett, B. J.*, Corp'l, I, 55th North Carolina, age 19.	July 3, 1863.	Shot fracture of left humerus in upper third.	July 4, 1863.	Disarticulated at the shoulder by the oval method.	Exchanged March 3, 1864.
53	Chapel, M. H., Pt., K, 8th New York Heavy Artillery	June 3, 1864.	Shot wound of left arm, the humerus fractured.	June 3, 1864.	Disarticulated at the shoulder, by a Confederate surgeon.	Disch'd Jan. 28, 1865; pensioned.
54	Charters, J., Pt., C, 5th Maine.	Sept. 14, 1864.	Accidental shot fracture of left humerus; ball passed through lung and emerged from the back.	Sept. 14, 1864.	Amputated at the shoulder by the circular method.	Both wounds healed without trouble. Discharged March 21, 1865; not a pensioner.
55	Chase, A. C., Pt., C, 17th Vermont, age 45.	Sept. 30, 1864.	Fracture of the upper third of the left humerus.	Sept. 30, 1864.	Lateral flap amputation at the shoulder.	Disch'd June 12, 1865; pensioned.
56	Choate, C., Corp'l, K, 16th Maine.	June 17, 1864.	Shell wound of right shoulder, the head of the humerus shattered.	June 19, 1864.	Disarticulation at the shoulder, by Surg. C. Alexander, 16th Maine.	Disch'd Dec. 7, 1864; pensioned.
57	Clark, L. E., Pt., I, 14th Ohio, age 18.	Sept. 1, 1864.	Comminuted shot fracture of upper third of left humerus.	Sept. 2, 1864.	Amputation at the shoulder by Lisfranc's method, by Surg. C. N. Fowler, 105th Ohio.	Disch'd Mar. 22, 1865; pensioned.
58	Clay, W. H., Pt., A, 6th Wisconsin.	Aug. 28, 1862.	Shot wound of right shoulder joint.	Aug. 30, 1862.	Amputated at the shoulder, by Surg. J. McNulty, U. S. V.	Disch'd Nov. 13, 1862; pensioned.
59	Coddington, E. H., Sergt., F, 14th Iowa.	Feb. 13, 1862.	Fracture of left humerus one inch below the head by grape-shot.	Feb. 14, 1862.	Amputation at the shoulder by the oval method.	Disch'd Aug. 15, 1862; pensioned. Shoulder weak and shrivelled: indistinct respiratory murmur over right lung.
60	Cole, T., Pt., B, 5th Michigan, age 44.	May 5, 1864.	Right humerus shattered at the surgical neck.	May 6, 1864.	Amputated at the shoulder, by Surgeon H. F. Lyster, 5th Michigan.	Slow progress. Disch'd Oct. 3, 1864; pensioned.
61	Coles, A. W., Pt., E, 39th Massachusetts, age 31.	Feb. 7, 1865.	Shot wound of upper third of left arm, with extensive comminution of the humerus.	Feb. 7, 1865.	Amputated at the shoulder by the double flap method, by Surgeon W. Thorndike, 39th Massachusetts.	Disch'd May 18, 1865; pensioned. Pension Examining Board, Jan. 6, 1875, states: "About 2 inches of the superior extremity of the humerus remain, but in dislocated condition."
62	Conlin, J., Pt., D, 49th Pennsylvania, age 30.	May 6, 1864.	Shot wound of left shoulder joint.	May 6, 1864.	Antero-posterior flap amputation at the shoulder.	Disch'd Dec. 4, 1864; pensioned.
63	*Cornell, J. E.*, Sergt., I, 50th Georgia, age 27.	July 2, 1863.	Fracture of the left humerus by a large projectile.	July 3, 1863.	Amputation at the shoulder by Listrane's plan.	July 19th, gangrene of stump; sol. chlor. sod. applied; Dec. 8th, erysipelas over shoulder. Exchanged March 17, 1864.
64	Coppes, F., Lieut., C, 72d Pennsylvania.	May 6, 1864.	Shot wound of left arm.....	May 8, 1864.	Amputation at the shoulder, by a Confederate surgeon.	Disch'd Sept. 9, 1864; pensioned.
65	*Croft, W. N.*, Pt., C, 61st Georgia, age 22.	July 2, 1863.	Shot fracture of the head of the left humerus.	July 3, 1863.	Antero-posterior flap amputation at the shoulder.	Sent to Provost Marshal Sept. 10, 1863.
66	*Crowder, J.*, Sergt., F, 40th Virginia, age 27.	July 3, 1863.	Upper third of right humerus fractured by a conoidal ball.	July 3, 1863.	Disarticulation at the shoulder by lateral flaps.	Exchanged March 3, 1864.
67	Cunningham, J., Pt., B, 11th Massachusetts.	Aug. 29, 1862.	Shot wound of left arm, involving the vessels and bone.	Aug. 30, 1862.	Amputation at the shoulder by double flaps.	Disch'd Oct. 15, 1862; pensioned.
68	Cunningham, F., Pt., H, 142d Pennsylvania.	Dec. 13, 1862.	Shot fracture of left humerus near the shoulder.	Dec. 13, 1862.	Amputation at the shoulder, by Surg. C. Bower, 6th Penn.	Disch'd Mar. 6, 1863; pensioned.
69	Daft, J. G., Pt., C, 14th New Jersey, age 21.	May 13, 1864.	Shot wound of right shoulder joint, humerus fractured.	May 13, 1864.	Amputation at the shoulder joint; flap operation.	Disch'd April 3, 1865; pensioned.
70	Dana, A., Corp'l, E, 2d U. S. Cavalry, age 27.	June 11, 1864.	Head and four inches of shaft of right humerus fractured by a conoidal ball.	June 11, 1864.	Amputation at the shoulder joint, by Ass't Surgeon J. W. Williams, U. S. A.	Walked about day after operation. Discharged and pensioned.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
71	*Davis, T. R.*, Pt., C, 1st Texas Battalion, age 28.	June 14, 1863.	Shaft of right humerus comminuted to the shoulder joint by spherical case shot.	June 14, 1863.	Amputation at the shoulder joint by transfixion.	Sloughing; portion of spine of scapula and some tissue removed. Exch'd Jan. 25, 1864.
72	*Dean, B. D.*, Sergt., A, 9th Louisiana.	Oct. 19, 1864.	Comp'd comminuted fracture of upper third of humerus.	Oct. 19, 1864.	Amputation at the shoulder by double flaps.	Sloughing arrested by turpentine and alcohol. Sent to Provost Marshal April 1, 1865.
73	Dean, J., Pt., I, 9th Pennsylvania.	Aug. 30, 1862.	Shell wound of the right arm.	Aug. 30, 1862.	Amputation at the shoulder by the circular method.	Disch'd May 27, 1865; pensioned. Died Feb. 14, 1868, of pulmonary consumption, caused by the wound.
74	De Condres, L. C., Corp'l, K, 16th Wisconsin.	Oct. 4, 1862.	Shot wound of the right arm, the humerus shattered.	Oct. 6, 1862.	Disarticulated at the shoulder, by Surg. S. P. Thornhill, 8th Wisconsin.	Disch'd Nov. 10, 1862; pensioned. Stump occasionally sore.
75	De Graffe, C., Pt., D, 61st New York.	Sept. 17, 1862.	Wound of the left arm by solid shot.	Sept. 17, 1862.	Amputated three hours after injury, by Surg. J. H. Taylor, U. S. V.	Disch'd Nov. 25, 1862; pensioned.
76	Denison, J. T., Corp'l, G, 67th New York, age 21.	May 6, 1864.	Compound fracture of neck of left humerus.	May 6, 1864.	Amputated at the shoulder, by Surg. Ph. Leidy, 119th Penn.	Disch'd July 4, 1864; pensioned. Died January 19, 1875.
77	Derstine, G. A., Pt., B, 10th U. S. Infantry.	May 24, 1864.	Right arm carried away by solid shot.	May 24, 1864.	Amputated at the shoulder by oval method.	Disch'd Sept. 30, 1864; pensioned. Died August 25, 1868, of pulmonary disease, caused by the wound.
78	Dewey, F., Pt., A, 36th Wisconsin, age 42.	June 18, 1864.	Shot fracture of upper third of left humerus.	June 18, 1864.	Disarticulated at the shoulder, by Surg. C. Miller, 36th Wis.	Disch'd Oct. 24, 1864; pensioned.
79	Dieck, A., Pt., B, 3d Missouri, age 32.	May 14, 1864.	Fracture of left humerus by a large projectile.	May 14, 1864.	Amput'd at shoulder, by Surg. A. T. Hudson, 26th Iowa.	Disch'd Sept. 10, 1864; pensioned.
80	Dietrick, G., Pt., C, 140th New York.	May 5, 1864.	Shot wound of right arm, the humerus shattered.	May 5, 1864.	Amputated at the shoulder, by a Confederate surgeon.	Disch'd Mar. 25, 1865; pensioned.
81	Dietzman, G., Pt., A, 17th Missouri.	May 12, 1863.	Fracture of the right humerus; shoulder joint involved.	May 12, 1863.	Amputated at the shoulder, by Surg. C. Forster, 58th Ohio.	Disch'd Aug. 8, 1865; pensioned.
82	Dobbins, T., Pt., E, 25th Missouri.	Sept. 20, 1861.	Left arm carried away clean from body, and two ribs fractured, by a six-pound ball.	Sept. 20, 1861.	Amputated at the shoulder, by Surgeon J. T. Hodgen.	Disch'd Mar. 22, 1862; pensioned.
83	Dodds, E., Sergt., C, 21st New York Cavalry.	Aug. 21, 1864.	Fracture of upper third of right humerus; shoulder joint involved; also fracture of maxillary bone.	Aug. 21, 1864.	Amputated by flap method, by Surgeon G. S. Dilts, 5th New York Heavy Artillery.	Disch'd July 5, 1865; pensioned.
84	*Doggett, D. S.*, Pt., F, 35th Virginia.	June 9, 1863.	Right humerus fractured three inches below the head by pistol ball.	June 11, 1863.	Amputated at the shoulder, by Surg. G. S. Palmer, U. S. V.	Exchanged March 3, 1864. *Spec.* 1234, A. M. M.
85	Dolan, J., Pt., B, 26th Indiana, age 36.	June 18, 1864.	Wound of the left arm by grape, the bone shattered.	June 18, 1864.	Circular flap amputation at the shoulder.	Disch'd April 1, 1865; pensioned.
86	Dolph, W., Corp'l, D, 53d Pennsylvania, age 28.	July 2, 1863.	Head and upper portion of left humerus shattered by a conoidal ball.	July 2, 1863.	Amputation at the shoulder, by Surgeon C. S. Wood, 66th New York.	Disch'd Feb. 4, 1865; pensioned. Killed by railroad accident June 27, 1865.
87	Dorsch, H., Pt., C, 48th Pennsylvania.	Sept. 17, 1862.	Shot fracture of upper third of left humerus.	Sept. 19, 1862.	Amputation at the shoulder by Larrey's method.	Disch'd Dec. 7, 1862; pensioned.
88	Doyle, P., Pt., K, 3d Delaware, age 30.	June 18, 1864.	Shot fracture of upper third of left humerus.	June 18, 1864.	Amputated at the shoulder by the flap method, by Surg. D. E. Wolfe, 3d Delaware.	Disch'd Mar. 29, 1865; pensioned.
89	Drake, J., Pt., D, 73d Ohio, age 24.	Oct. 29, 1863.	Shot fracture of left wrist, passing to the upper part of the humerus, involving the shoulder joint.	Oct. 31, 1863.	Amputated by the oval method, by Surgeon I. N. Himes, 73d Ohio.	Disch'd April 4, 1864; pensioned.
90	Dunbar, J. L., Pt., 37th Massachusetts, age 27.	April 7, 1865.	Fracture of right humerus at upper third by conoidal ball; parts crushed and lacerated.	April 7, 1865.	Amputation at the shoulder by Lisfranc's method.	Disch'd July 7, 1865; pensioned.
91	Dunkel, J., Pt., G, 115th Pennsylvania.	May 3, 1863.	Comp'd comminuted fracture of head and shaft of the right humerus.	May 3, 1863.	Amputation by the flap method, by Surg. C. S. Wood, 66th New York.	Disch'd Mar. 4, 1864; pensioned.
92	Dunn, J., Pt., I, 121st Ohio.	Mar. 19, 1865.	Shot fracture of right humerus, with injury of the vessels.	Mar. 19, 1865.	Amputation at the shoulder by transfixion.	Disch'd June 7, 1865; pensioned.
93	Dusenbury, G. W., Pt., E, 40th Indiana, age 21.	Dec. 15, 1864.	Fracture of upper third of left humerus by pistol ball.	Dec. 15, 1864.	Amputated at the shoulder, by Surg. T. L. Magee, 51st Ill.	Mustered out May 8, 1865; pensioned.
94	*Eady, E. H.*, Sergt., B, 9th Louisiana, age 23.	Oct. 19, 1864.	Comminuted fracture of right arm.	Oct. 19, 1864.	Amputated at the shoulder, by Ass't Surg. E. P. Clark, 31st Massachusetts.	Released on parole, Feb. 15, 1865.
95	Eckinroth, H., Pt., G, 148th Pennsylvania.	May 2, 1863.	Comminuted fracture of head of the right humerus; joint opened.	May 2, 1863.	Amputated at the shoulder, by Surgeon A. N. Dougherty, U. S. V.	Disch'd Nov. 23, 1863; pensioned.
96	Egner, C., Pt., K, 8th Pennsylvania Cavalry, age 28.	April 7, 1865.	Comp'd comminuted fracture of head and upper portion of left humerus; also wound of chest.	April 8, 1865.	Amputation at the shoulder by the oval method.	Disch'd July 26, 1865; pensioned.
97	Eichler, C., Sergeant-major, 10th Minnesota, age 36.	Dec. 16, 1864.	Fracture of left arm by a cannon ball.	Dec. 16, 1864.	Amputated at the shoulder, by Ass't Surg. F. H. Milligan, 10th Minnesota.	Disch'd June 13, 1865; pensioned.
98	Ettinger, G., Pt., A, 13th Indiana.	Oct. 1, 1861.	Accidental shot wound of right arm, fracturing the bone.	Oct. 1, 1861.	Amputated at the shoulder, by Surg. A. D. Gall, 13th Indiana.	Disch'd Jan. 16, 1862; pensioned.
99	*Evans, E. A.*, Corp'l, D, 8th Georgia, age 24.	July 10, 1863.	Head of right humerus shattered by conoidal ball.	July 10, 1863.	Amputation at the shoulder by Dupuytren's plan.	August 11th, gangrene; ligatures removed and nitric acid applied. Paroled Sept. 23, 1863.
100	Ewing, J., Pt., H, 49th Pennsylvania, age 35.	Apr'l 28, 1864.	Wound of right shoulder joint by a large projectile.	Apr'l 28, 1864.	Amputation at the shoulder, by Surg. Ph. Leidy, 119th Pennsylvania.	Disch'd Jan. 16, 1865; pensioned. Wound never healed; diarrhœa, consumption; and finally death occurred Feb. 25, 1867.
101	Fairfield, L. M., Pt., D, 27th Michigan, age 22.	June 3, 1864.	Shot wound of right shoulder; humerus crushed; great disorganization of surrounding parts.	June 3, 1864.	Amputated at the shoulder by oval flaps, by Surgeon A. F. Whelan, 1st Michigan Sharpshooters.	Disch'd May 11, 1865; pensioned. Died February 24, 1869.
102	*Fallon, E., Pt., 12th New York Battery, age 26.	May 30, 1864.	Comminuted fracture of head and upper third of humerus.	May 30, 1864.	Amputated at the shoulder by the lateral flap method.	Disch'd June 12, 1865; pensioned.
103	*Fellew, S. H.*, Pt., C, 3d South Carolina.	July 3, 1863.	Upper third of left humerus shattered, and flesh wound of upper third of thigh.	July 5, 1863.	Amputated at the shoulder by the flap method.	Paroled September 25, 1863.

104	*Ferguson, H. C.*, Pt., G, 1st Virginia.	July 3, 1863.	Shot fracture of left arm and lesion of the brachial artery.	July 3, 1863.	Amputation at the shoulder by Larrey's method.	Necrosed portion of the acromion process removed; retired Aug. 29, 1864.
105	Ferner, N., Pt., M, 8th New York Heavy Artillery, age 21.	June 3, 1864.	Grapeshot wound of middle third of left arm.	June 4, 1864.	Amputation at the joint by circular method, by Surgeon J. L. Brenton, 8th Ohio.	Disch'd Jan. 31, 1865; pensioned.
106	Ferris, J. J., Corp'l, K, 73d Indiana.	Apr'l 30, 1863.	Shot wound of the left arm and right hand; hand totally destroyed with the exception of the thumb.	Apr'l 30, 1863.	Left arm amputated at shoulder, by Ass't Surgeons W. Spencer and S. F. Myers, 73d Indiana.	Disch'd Oct. 21, 1863; pensioned.
107	Fielding, C., Pt., A, 105th Ohio.	Oct. 8, 1862.	Fracture of right humerus, involving shoulder joint; arm nearly torn off by shell.	Oct. 10, 1862.	Amputation at the shoulder, by Surgeon C. N. Fowler, 105th Ohio.	Disch'd Dec. 30, 1862; pensioned.
108	Folhs, R., Pt., K, 72d New York, age 19.	May 5, 1862.	Fracture of left arm by a large missile.	May 6, 1862.	Amputated at the shoulder, by Surgeon J. A. Skilton, 87th New York.	Disch'd Aug. 8, 1862; pensioned. Nov. 14, 1862, a neuroma at the lower portion of the cicatrix was excised by Dr. F. M. Markoe. Stump remains tender.
109	Forker, O. H. P., Serg't, H, 57th Illinois, age 23.	Dec. 16, 1864.	Shot comminution of head and upper third of left humerus.	Dec. 17, 1864.	Amputation at the shoulder by the antero-posterior flap method, by Act. Ass't Surg. J. E. Link.	Disch'd July 12, 1865; pensioned.
110	French, H. H., Serg't, F, 64th New York, age 28.	July 2, 1863.	Ball entered at anterior extremity of second rib and emerged at outer side of right arm, fracturing humerus.	July 4, 1863.	Antero-posterior flap amputation, by Surg. D. E. Kelsey, 64th New York.	Disch'd Jan. 29, 1864; pensioned.
111	Fritzinger, J., Pt., H, 61st Pennsylvania, age 40.	May 12, 1864.	Shot wound of right arm at upper third.	May 12, 1864.	Amputation at the shoulder by lateral flap.	Disch'd July 15, 1864; pensioned.
112	Frizzell, W., Corp'l, H, 2d New York, age 21.	May 3, 1863.	Fracture of upper third of right arm by a conoidal ball.	May 3, 1863.	Amputated at the shoulder, by Ass't Surg. George King, 16th Massachusetts.	Disch'd Mar. 26, 1863; pensioned. Died Jan. 28, 1869, of disease of right lung, the result of wound.
113	Fulcher, G. W., Pt., H, 83d Indiana.	May 28, 1863.	Fracture of left arm by grapeshot.	May 28, 1863.	Amputated at the shoulder by double flap operation, by Surg. M. W. Robbins, 4th Iowa.	Disch'd July 27, 1863; pensioned. Died February 23, 1870.
114	Fuller, D., Pt., G, 53d Pennsylvania.	Sept. 17, 1862.	Shell wound of both arms, with fracture of right humerus.	Sept. 17, 1862.	Right arm amputated at the shoulder joint.	Oct. 5, 1862, amputation of left forearm at upper third. Disch'd Dec. 17, 1862; pensioned.
115	Gardiner, J. E., Pt., B, 24th Iowa, age 24.	April 8, 1864.	Shot fracture of the head of the left humerus.	April 9, 1864.	Amputation at the shoulder by the oval method.	Disch'd Aug. 5, 1864; pensioned.
116	*Garmer, G. W.*, Pt., E, 7th Georgia.	Aug. 16, 1864.	Shot fracture of upper third of left humerus.	Aug. 16, 1864.	Flap amputation at shoulder, by the regimental surgeon.	Exchanged August 21, 1864.
117	Gates, G. W., Pt., F, 4th Maryland, age 36.	June 1, 1864.	Shot fracture of left humerus near shoulder joint.	June 2, 1864.	Lateral flap amputation, by Surgeon R. H. Robinson, 7th Maryland.	June 21st, sloughing; nitrate of silver and chlorine applied. Disch'd Sept. 6, 1864; pensioned.
118	Gillison, S., Pt., A, 7th Indiana, age 23.	May 7, 1864.	Shot fracture of upper third of left arm.	May 7, 1864.	Amputated at the shoulder, by Surg. G. W. New, 7th Ind.	Mustered out September 20, 1864; pensioned.
119	*Giles, J. P.*, Pt., L, 1st Texas.	Sept. 29, 1864.	Shot fracture of upper third of left humerus.	Sept. 29, 1864.	Amputated at the shoulder, by Surg. E. M. Waters, C. S. A.	Furloughed October 8, 1864.
120	Genevan, R. H., Corp'l, D, 3d Ohio.	Oct. 8, 1862.	Grapeshot wound of left arm, severing arm from body.	Oct. 8, 1862.	Amputated at the shoulder, by Surgeon R. R. Mees.	Disch'd Dec. 23, 1862; pensioned.
121	*Glover, R. T.*, Pt., D, 43d Alabama, age 22.	May 17, 1864.	Shot fracture of the head of the humerus.	May 19, 1864.	Amputation at the shoulder ...	Fœtid discharge at first; May 31st, convalescing.
122	*Goodloe, D. S.*, Adjutant, 18th Mississippi, age 24.	July 2, 1863.	Comp'd comminuted fracture of upper third of left humerus.	July 2, 1863.	Amputation at the shoulder by Lisfranc's method.	Aug. 25, 1863, abscess opened in axilla. Exch'd Mar. 3, 1864.
123	Goodrich, H. H., Pt., F, 14th Connecticut.	Aug. 25, 1864.	Shot fracture of left shoulder joint.	Aug. 26, 1864.	Amputation at the shoulder, by Surg. G. Chaddock, 7th Mich.	Disch'd April 29, 1865; pensioned.
124	Greer, C., Pt., A, 4th Delaware, age 31.	Oct. 8, 1864.	Fracture of left humerus by a cannon ball.	Oct. 9, 1864.	Flap amputation at shoulder, by Surg. A. A. White, 8th Maryland.	Disch'd July 20, 1865; pensioned.
125	Greyble, G. L., Pt., B, 93d Indiana, age 18.	Dec. 16, 1864.	Comminuted shot fracture of lower third of right humerus.	Dec. 17, 1864.	Flap amputation at shoulder, by Ass't Surg. G. E. Irwin, 93d Indiana.	Disch'd July 29, 1865; pensioned.
126	Griffith, T. P., Pt., I, 48th Illinois.	April 7, 1862.	Wound of right shoulder joint by a shell.	April 7, 1862.	Amputation at the shoulder by Larrey's plan.	Disch'd July 17, 1862; pensioned.
127	Gutermann, C., Pt., F, 2d U. S. Infantry, age 30.	May 1, 1863.	Shot fracture of the head of left humerus.	May 1, 1863.	Amputation at the shoulder, by Ass't Surgeon J. S. Billings, U. S. A.	Disch'd Feb. 5, 1864; pensioned.
128	Gyger, A., Pt., A, 122d Pennsylvania.	May 3, 1863.	Shot wound of right shoulder joint.	May 3, 1863.	Amputated at the shoulder, by Surg. F. Reynolds, 88th N. Y.	Mustered out May 15, 1863; pensioned.
129	Hacker, A., Corp'l, E, 93d Indiana.	May 22, 1863.	Fracture of left shoulder by a conoidal ball.	May 24, 1863.	Amputated at the shoulder, by Surg. M. W. Fisk, 11th Mo.	Disch'd Aug. 8, 1863; pensioned.
130	Hadlock, W., Pt., C, 6th Iowa, age 21.	Nov. 22, 1864.	Shell fracture of right humerus, high up.	Nov. 22, 1864.	Amputated at the shoulder, by Surg. R. Morris, 103d Illinois.	Disch'd Feb. 21, 1865; pensioned.
131	Hallen, B. C., Pt., A, 36th Wisconsin.	June 18, 1864.	Shell fracture of upper third of left humerus.	June 18, 1864.	Amputated at the shoulder, by Surg. D. W. Maull, 1st Del.	Disch'd Sept. 27, 1864; pensioned.
132	*Ham, I. C.*, Pt., B, 3d Virginia Cavalry.	June 21, 1864.	Shot wound of humerus, shattering its upper part.	June 21, 1864.	Amputated at the shoulder, by Surg. E. I. Habersham, C. S. A.	Retired from service September 21, 1864.
133	Hambke, A., Pt., H, 15th New York Heavy Artillery.	Aug. 18, 1864.	Shot fracture of left humerus.	Aug. 20, 1864.	Amputated at the shoulder by antero-posterior flaps.	Disch'd Dec. 6, 1864; pensioned.
134	Hannam, S., Corp'l, B, 2d Delaware.	July 3, 1863.	Shell fracture of left humerus; arm carried away.	July 3, 1863.	Amputation at the shoulder, by Dr. Higgins.	Disch'd Oct. 9, 1863; pensioned.
135	* *Hardie, J. M.* B., Pt., 17th Mississippi, age 19.	Sept. 17, 1862.	Conoidal ball comminuted the upper portion of the right humerus.	Sept. 17, 1862.	Flap amputation at the shoulder.	Convalescent October 1, 1862.
136	Hardy, A. E., Pt., F, 1st Maine Heavy Artillery, age 21.	Oct. 2, 1864.	Shell fracture of head and surgical neck of right humerus, acromial process of scapula, and probably glenoid cavity.	Oct. 2, 1864.	Amputated at the shoulder, by Surgeon D. S. Hays, 110th Pennsylvania.	Disch'd Aug. 30, 1865; pensioned. Stump sensitive. *Spec.* 4115, A. M. M.
137	Harrison, A. J., Lieut., H, 126th Ohio, age 26.	May 6, 1864.	Comp'd comminuted fracture of right humerus.	May 7, 1864.	Amputated at the shoulder, by a Confederate surgeon.	Stump sound. Disch'd Dec. 20, 1864; pensioned.
138	* *Harrison, W. H.*, Pt., Peyton's Virginia Battery, age 41.	Sept. 17, 1862.	Lower half of left arm torn off by a fragment of shell; no bleeding from torn vessels.	Sept. 18, 1862.	Flap amputation at the shoulder.	October 1, 1862, doing well.

* See FISCHER, G. J., *Report of Fifty-seven Cases of Amputation, in the Hospitals near Sharpsburg, Md., after the Battle of Antietam September* 17, 1862, in *Am. Jour. Med. Sci.*, 1863, Vol. XLV, N. S., p. 48.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
139	*Hawkins, W. H.*, Pt., L, 21st North Carolina, age 36.	Sept. 19, 1864.	Comp'd comminuted fracture of upper third of left humerus and laceration of soft parts; joint involved.	Sept. 21, 1864.	Amputated at the shoulder by Larrey's method, by Surgeon E. L. Brevard, C. S. A.	Released April 18, 1865.
140	Hayes, G., Pt., F, 54th Massachusetts Colored Troops.	Feb. 10, 1865.	Right arm shattered, forearm torn away, both eyes destroyed by accidental discharge of a cannon.	Feb. 10, 1865.	Amputated at the shoulder, by Ass't Surg. N. S. Roberts, 21st U. S. Colored Troops.	Disch'd Sept. 8, 1865; pensioned. Wound healed, but tender.
141	*Hayes, W. M.*, Pt., E, 20th Georgia Batt. of Cavalry, age 19.	June 11, 1864.	Shot wound of right arm, with fracture high up.	June 11, 1864.	Amputated at the shoulder, by Surgeon Metcalf.	Retired January 30, 1865.
142	Haynes, W., Pt., K, 3d East Tennessee, age 24.	May 14, 1864.	Comp'd comminuted fracture of upper third of right humerus; also wound of hip.	May 14, 1864.	Amputated at the shoulder, by Surgeon C. W. McMillan, 1st Tennessee.	Disch'd Feb. 23, 1865; pensioned.
143	Hazeltine, H. H., Pt., I, 4th Vermont, age 33.	May 5, 1864.	Comminuted fracture of left humerus by a grapeshot; soft parts much lacerated; joint involved.	May 6, 1864.	Flap amputation at the shoulder, by Surgeon D. M. Goodwin, 3d Vermont.	Disch'd Oct. 22, 1864; pensioned.
144	Heaton, S., Pt., F, 1st Pennsylvania Cavalry.	Nov. 12, 1862.	Shot wound of right arm, with humerus shattered.	Nov. 12, 1862.	Amputation at the shoulder, by Surgeon D. Stanton, 1st Pennsylvania Cavalry.	Disch'd Dec. 10, 1862; pensioned.
145	*Hedick, A.*, Pt., B, 23d North Carolina, age 23.	May 3, 1863.	Shot fracture of right humerus, extending into joint.	May 5, 1863.	Flap amputation at shoulder...	Furloughed July 11, 1863.
146	Heistonbrittle, D., Pt., C, 44th New York, age 24.	Sept. 30, 1864.	Comp'd comminuted fracture of upper third of left humerus.	Oct. 1, 1864.	Amputation at the shoulder by the oval method.	Disch'd Mar. 14, 1865; pensioned.
147	Held, F., Sergeant, B, 56th Ohio.	May 16, 1863.	Shot fracture of right arm near the shoulder.	May 18, 1863.	Amputation at the shoulder by transfixion.	Disch'd Nov. 5, 1863; pensioned.
148	Hendrickson, L. C., Pt., K, 95th Pennsylvania.	June 1, 1864.	Shell wound of right arm, with lesion of the vessels.	June 1, 1864.	Flap amputation at the shoulder, by Surg. E. P. B. Kelly, 95th Pennsylvania.	Disch'd Dec. 5, 1864; pensioned.
149	Henesy, T. J., Pt., C, 10th Vermont, age 30.	Oct. 19, 1864.	Shot fracture of upper third of left humerus, extending into joint, and injury of scapula.	Oct. 19, 1864.	Double flap amputation, by Surg. T. A. Helwig, 87th Pennsylvania.	Disch'd May 27, 1865; pensioned.
150	Henry, O., Pt., F, 61st New York.	June 29, 1862.	Shell wound of right shoulder, with fracture.	June 29, 1862.	Amputation at the shoulder by the oval method.	Disch'd May 5, 1863; pensioned.
151	Hewins, G. W., Pt., E, 3d Wisconsin.	June 9, 1863.	Shot wound of left shoulder joint; humerus fractured.	June 9, 1863.	Amputation at the shoulder by Lisfranc's method.	Disch'd Oct. 7, 1863; pensioned.
152	*Hicks, C. A.*, Pt., H, 11th Mississippi.	July 3, 1863.	Shot fracture of neck of right humerus.	July 5, 1863.	Amputation at the shoulder by double flaps.	September 30th, wound healed; discharged October 12, 1863.
153	Higgins, L., Pt., G, 148th Pennsylvania, age 31.	May 5, 1864.	Comminuted fracture of upper third of left humerus.	May 6, 1864.	Lateral flap amputation at the shoulder, by Surg. J. Ebersole, 19th Indiana.	Disch'd Jan. 23, 1865; pensioned. *Spec.* 93, A. M. M. Died Feb. 14, 1870.
154	Hill, J. A., Pt., A, 13th Illinois.	Dec. 29, 1862.	Fracture of left humerus by a fragment of shell.	Dec. 29, 1862.	Amputated at the shoulder, by Surg. S. C. Plummer, 13th Illinois.	Disch'd Feb. 19, 1863; pensioned.
155	Hobbs, G., Pt., D, 1st Mass. Heavy Artillery, age 46.	Oct. 2, 1864.	Compound fracture of upper third of right humerus.	Oct. 3, 1864.	U-flap amputation, by Surg. D. Evarts, 20th Indiana.	Disch'd June 15, 1865; pensioned. *Spec.* 4124, A. M. M.
156	Holley, H. H., Pt., H, 26th Michigan, age 20.	May 12, 1864.	Shot fracture of neck and shaft of right humerus.	May 12, 1864.	Amputated at the shoulder, by Surg. J. W. Wishart, 140th Pennsylvania.	Disch'd Nov. 29, 1864; pensioned.
157	Hollowell, C. H., Pt., G, 1st Mississippi Mounted Marine Brigade, age 23.	June 2, 1864.	Wound of right arm by solid shot.	June 2, 1864.	Amputated at the shoulder, by Surg. J. Roberts, 1st Miss. Mounted Mar. Brigade.	Disch'd Jan. 10, 1865; stump healed; pensioned.
158	Henaans, C., Corp'l, E, 39th New York, age 19.	May 9, 1864.	Head of left humerus fractured by a musket ball.	May 10, 1864.	Amputated at the shoulder, by Surgeon P. E. Hubon, 28th Massachusetts.	Disch'd Jan. 28, 1865; pensioned.
159	Hooper, W. H., Pt., K, 12th Massachusetts, age 27.	July 3, 1863.	Fracture of upper third of right humerus.	July 4, 1863.	Flap amputation at shoulder ..	Disch'd April 11, 1864; pensioned.
160	Houck, A., Pt., E, 84th Pennsylvania, age 20.	Aug. 6, 1864.	Shot wound of right arm; bone shattered.	Aug. 16, 1861.	Flap amputation at shoulder...	Slight sloughing. Disch'd Sept. 2, 1865; pensioned.
161	Houghton, C. W., Lieut., C, 27th Michigan, age 28.	May 12, 1864.	Shot wound of left arm, with injury of bone and artery.	May 12, 1864.	Amputation at the shoulder by the oval method.	Disch'd Oct. 5, 1864; pensioned. Entered Veteran Reserve Corps April 8, 1865.
162	Houston, R., Sergt., A, 59th New York.	July 3, 1863.	Shell fracture of right humerus, with laceration of the soft parts.	July 4, 1863.	Amputated at the shoulder, by Surg. W. J. Burr, 42d New York.	Abscess formed. Disch'd Oct. 7, 1863. Entered V. R. C. Disch'd June 15, 1864; pension allowed but never called for.
163	Huenemann, J. B., Pt., I, 76th Ohio, age 24.	Aug. 26, 1864.	Shell fracture of the head of the left humerus.	Aug. 26, 1864.	Amputated at the shoulder, by Asst. Surg. D. Holderman, 46th Ohio.	Disch'd April 9, 1865; pensioned.
164	Huffmann, L. W., Pt., I, 7th New Jersey, age 27.	May 9, 1864.	Comminuted shell fracture of upper third of right humerus.	May 11, 1864.	Antero-posterior flap amputation, by Surg. C. C. Jewett, 16th Massachusetts.	Mustered out October 7, 1864; pensioned. *Spec.* 2903, A. M. M.
165	Hughes, P., Corp'l, F, 2d U. S. Cavalry, age 28.	May 31, 1864.	Shot wound of right arm above and below elbow joint, badly fracturing bones.	May 31, 1864.	Double flap amputation, by Asst. Surg. C. I. Wilson, U. S. A.	Returned to duty, and discharged from service April 1, 1865, and pensioned.
166	Hull, B., Pt., K, 9th New Jersey, age 28.	Dec. 16, 1862.	Upper third of left humerus shattered by grapeshot; soft parts, vessels, and nerves torn; no shock.	Dec. 16, 1862.	Double flap amputation at the shoulder, by Surg. Geo. A. Otis, 27th Massachusetts.	Jan. 16, 1863, wound cicatrized; transferred to V. R. C. Dec. 5, 1863. Discharged Sept. 9, 1864; pensioned.
167	*Harley, C.*, Pt., H, 1st South Carolina, age 24.	May 3, 1863.	Shot fracture of upper third of arm.	May 3, 1863.	Amputation at the shoulder by transfixion.	Exchanged July 3, 1863.
168	Hutchins, S., Pt., E, 2d New York.	Aug. 14, 1864.	Shot fracture of right humerus at the surgical neck, with wound of brachial.	Aug. 14, 1864.	Antero-posterior flap amputation.	Sept. 30, 1864, secondary hæmorrhage; axilla artery ligated at the stump. Disch'd Nov. 22, 1864; pensioned.
169	*Hutchinson, L. M.*, Pt., B, 21st South Carolina, age 22.	Aug. 21, 1864.	Shot wound of middle third of arm.	Aug. 21, 1864.	Flap amputation at shoulder .	Sent to Old Capitol Prison Nov. 26, 1864.
170	Hutton, E. R., Corp'l, C, 53d Illinois, age 21.	July 12, 1863.	Shot fracture of right humerus.	July 12, 1863.	Amputation at the shoulder by the oval method.	Disch'd Dec. 4, 1863; pensioned.
171	Ingle, W. H., Pt., K, 49th Ohio, age 22.	May 27, 1864.	Shot wound of left shoulder joint.	May 29, 1864.	Amputated at the shoulder, by Surg. H. B. Tuttle, 89th Illinois.	Disch'd Dec. 9, 1864; pensioned.

317	Stutsman, A. H., Pt., C, 1st Iowa Cavalry, age 25.	Aug. 27, 1863.	Comminuted shot fracture of left humerus; shoulder joint opened.	Aug. 29, 1863.	Amputated by Lisfranc's operation, by Surgeon Joseph C. Lymph.	Disch'd Jan. 19, 1864; pensioned.
318	Sullivan, J., Pt., I, 6th New Hampshire, age 23.	Sept. 30, 1864.	Fracture of right shoulder by a cannon ball.	Sept. 30, 1864.	Amputated by the flap method, by Surgeon W. Ingalls, 59th Massachusetts.	Disch'd June 7, 1865; pensioned.
319	Summers, D., Pt., A, 15th West Virginia, age 45.	July 17, 1864.	Fracture of upper third of right humerus.	July 18, 1864.	Amputated at the shoulder by the antero-posterior oval flap method.	Disch'd Mar. 4, 1865; pensioned.
320	Sunderland, J., Pt., E., 48th Pennsylvania.	Dec. 13, 1862.	Shell wound of right arm	Dec. 13, 1862.	Amputation at the shoulder by double flaps.	Disch'd April 11, 1863; pensioned.
321	*Sutphin, F.*, Pt., C, 24th Virginia, age 19.	May 16, 1864.	Fracture of upper third of left humerus; flesh wound of left leg.	May 16, 1864.	Amputated at the shoulder, by Surg. W. V. Harrison, C. S. A.	Retired February 3, 1865.
322	Swenson, J., Corp'l, D, 52d Illinois.	Oct. 4, 1862.	Shot wound of left arm; the humerus shattered.	Oct. 4, 1862.	Amputated at the left shoulder joint, by Surg. J. Andrews, 2d Michigan Cavalry.	Mustered out July 6, 1865; pensioned.
323	Taggart, J. S., Corp'l, E, 35d New York, age 19.	May 4, 1863.	Shot fracture of left humerus; laceration of soft parts.	May 4, 1863.	Amputation at the shoulder by the oval method.	Disch'd June 1, 1863; pensioned.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
324	Taylor, T., Pt., B, 58th Illinois, age 18.	May 18, 1864.	Shot fracture of left humerus near the shoulder joint.	May 19, 1864.	Amputated at the shoulder, by Surg. H. M. Crawford, 58th Illinois.	Mustered out April 1, 1866; pensioned.
325	Thing, E., Corp'l, K, 116th Maine, age 22.	Aug. 18, 1864.	Shot fracture of left humerus at surgical neck.	Aug. 18, 1864.	Amputation at the shoulder. ..	Disch'd Mar. 2, 1865; pensioned.
326	*Tuomas, J. W.*, Pt., K, 21st Alabama, age 42.	April 8, 1865.	Shell wound of left arm, with injury of bone and artery.	April 8, 1865.	Amputation at the shoulder....	Paroled June 28, 1865.
327	Thrane, T., Corp'l, K, 2d New York.	Aug. 27, 1862.	Shot fracture of left humerus in the upper third.	Aug. 27, 1862.	Amputated at the shoulder, by Surg. L. McLean, 2d N. York.	Disch'd Oct. 27, 1862; pensioned.
328	*Trimball, L. A.*, Corp'l, G, 9th Arkansas, age 23.	Dec. 15, 1864.	Shot wound of left arm, with injury of bone and vessels.	Dec. 17, 1864.	Amputation at the shoulder....	Sent to Provost Marshal Feb. 24, 1865.
329	Ulp, C. C., Pt., B, 76th Pennsylvania, age 21.	July 11, 1863.	Shot fracture of left humerus in upper third.	July 13, 1863.	Amputated, by Surg. R. A. Kinloch, U. S. A.	Disch'd Jan. 7, 1864; pensioned.
330	Underwood, O., Pt., K, 43d Ohio.	Feb. 3, 1865.	Shot fracture of left arm, high up; laceration of soft parts.	Feb. 3, 1865.	Amputated at the shoulder, by Surg. F. M. Rose, 43d Ohio.	Disch'd June 17, 1865; pensioned.
331	——, —, Pt., 7th Michigan.	Dec. 13, 1862.	Extensive comminution of right humerus and fracture of the scapula and clavicle; parts lacerated.	Dec. 13, 1862.	Amputated at shoulder joint, with removal of portions of scapula and clavicle, by Surg. C. S. Wood, 66th New York.	Favorable .. ..
332	Vail, E., Pt., I, 159th New York.	May 24, 1863.	Shot wound of left arm, with injury of vessels and bone.	May 24, 1863.	Amputated at shoulder joint, by Surg. C. Robertson, 159th New York.	Disch'd July 29, 1863; pensioned.
333	Valence, C., Pt., E, 1st Pennsylvania Rifle Reserves.	June 26, 1862.	Shot wound of left arm, the humerus shattered.	June 27, 1862.	Amputation at the shoulder. ..	Disch'd Sept. 6, 1862; pensioned. Died June 24, 1870.
334	Vandersen, H. V., Pt., A, 11th U. S. Infantry.	June 27, 1862.	Shot wound of left arm, with injury of bone and artery.	June 28, 1862.	Amputation at the shoulder....	Disch'd Aug. 29, 1862; pensioned.
335	Vanliew, J., Pt., G, 149th Pennsylvania, age 21.	May 8, 1864.	Comminuted fracture of right arm.	May 8, 1864.	Amputated, by Surg. W. Humphreys, 149th Pennsylvania.	Disch'd Oct. 22, 1864; pensioned. *Spec.* III, A. M. M.
336	Van Raalta, D., Pt., I, 25th Michigan, age 19.	Aug. 26, 1864.	Fracture of upper third of right humerus; head of bone split; missile penetrated the cheek, chipping malar bone.	Aug. 26, 1864.	Amputated, by Surgeon A. M. Wilder, U. S. V.; fragments of bone removed from face.	Disch'd April 12, 1865; pensioned.
337	Van Tassell, H., Pt., I, 95th New York.	July 1, 1863.	Shot wound in left shoulder ...	July 1, 1863.	Amputated at the shoulder, by Surg. G. W. Metcalf, 76th N. Y.	To Veteran Reserve Corps Sept. 9, 1863.
338	Wager, S., Pt., B, 1st U. S. Artillery, age 21.	June 3, 1864.	Fracture of right humerus, high up, by a large projectile.	June 3, 1864.	Amputated at the shoulder by the flap method.	June 10, 1864, secondary hæmorrhage; circumflex ligated. Discharged Mar. 16, 1865; pensioned. Died Dec. 31, 1868, of consumption, resulting from amputation.
339	Wagner, A., Pt., E, 45th New York.	July 1, 1863.	Shot fracture of right humerus; soft parts near the shoulder carried away; arm held by skin of inner surface.	July 1, 1863.	Flap amputation at shoulder...	Disch'd Jan. 9, 1864; pensioned.
340	Wait, R. R., Pt., H, 49th New York.	May 12, 1864.	Shot fracture of left humerus by cannon ball.	May 12, 1864.	Amputation at the shoulder by transfixion.	Disch'd April 7, 1865; pensioned.
341	*Walker, G. W.*, Pt., M, 6th Alabama, age 26.	July 1, 1863.	Comp'd comminuted fracture of right humerus.	July 1, 1863.	Amputation at the shoulder....	Transferred, for exchange, Sept. 25, 1863.
342	Waltz, C. R., Pt., C, 140th Pennsylvania.	July 2, 1863.	Shot fracture of neck and shaft of right humerus.	July 3, 1863.	Flap amputation at shoulder, by Surgeon J. W. Wishart, 140th Pennsylvania.	Disch'd Dec. 19, 1863; pensioned.
343	Warner, G. W., Pt., B, 20th Connecticut, age 32.	July 3, 1863.	Shell wounds of both arms; one fragment severed right arm from body, another fractured bones of left forearm, lacerating soft parts.	July 3, 1863.	Amputation at right shoulder joint and of left arm at lower third of humerus.	Disch'd Oct. 17, 1863; pensioned.
344	*Watkins, D.*, Pt., E, 14th North Carolina, age 38.	July 1, 1863.	Comminution of right humerus and laceration of soft parts by shell.	July 1, 1863.	Amputation at the shoulder by the oval method.	Paroled September 25, 1863.
345	Webb, J. T., Pt., A, 114th Illinois.	May 20, 1863.	Fracture of right humerus in the upper third.	May 20, 1863.	Amputated at the shoulder, by Surg. M. W. Fisk, 11th Mo.	Disch'd July 20, 1863; pensioned.
346	Wegman, G., Pt , I, 6th New Jersey.	May 5, 1862.	Shot wound of right arm, with injury of vessels and bone.	May 6, 1862.	Flap amputation at shoulder, by Asst. Surg. J. H. Pooley, U. S. A.	Disch'd Aug. 29, 1862; pensioned.
347	Weight, W., Pt., D, 5th New Jersey.	June 1, 1862.	Shot wound of right arm, the humerus shattered.	June 1, 1862.	Amputation at the shoulder by double flaps.	Disch'd July, 1862; pensioned.
348	Wesley, S., Landsman, Gunboat Machinaw, age 23.	Feb. 14, 1865.	Shot fracture of right humerus.	Feb. 14, 1865.	Amputated at the shoulder, by a naval surgeon.	Sent to Marine Hospital in January, 1867; pensioned.
349	Westmeier, H., Pt., I, 70th Ohio, age 20.	Aug. 18, 1864.	Shot comminution of surgical neck of right humerus; shoulder joint opened.	Aug. 19, 1864.	Amputated at the shoulder, by Asst. Surg. D. Halderman, 46th Ohio.	Disch'd Jan. 2, 1865; pensioned.
350	Whitham, R., Pt., C, 15th New Jersey.	May 3, 1863.	Shot wound of right arm.....	May 3, 1863.	Amputation at the shoulder....	Disch'd Sept. 25, 1863; pensioned.
351	Widdicombe, B. F., Corp'l, H, 82d Pennsylvania, age 20.	June 3, 1864.	Severe shot wound of the left shoulder joint.	June 3, 1864.	Amputation at the shoulder by Larrey's method.	Disch'd Sept. 13, 1864; pensioned.
352	Wild, E. A., Colonel, 35th Massachusetts.	Sept. 14, 1862.	Loss of left arm by a round shot.	Sept. 16, 1862.	Amputated at the shoulder, by Dr. Rogers of New York.	Promoted to Brigadier General April 25, 1863. Mustered out January 15, 1866; pensioned.
353	Wilkinson, P., Pt., I, 81st Pennsylvania.	June 4, 1864.	Shot wound of right shoulder, the humerus shattered.	June 4, 1864.	Lateral flap amputation, by Surg. J. W. Wishart, 140th Pennsylvania.	Discharged April 5, 1865.
354	*Williams, J.*, Pt., A, 14th Tennessee, age 24.	July 2, 1863.	Shot fracture of upper third of right humerus.	July 4, 1863.	Amputation at the shoulder....	Sept. 4, 1863, sloughing. Paroled November 12, 1863.
355	*Wimberly, R. C.*, Pt., A, 3d Georgia, age 22.	July 1, 1863.	Shot wound through the right shoulder joint.	July 3, 1863.	Amputation at the shoulder by lateral flaps.	To Provost Marshal, for exchange, September 3, 1863.
356	Winchold, W., Pt., E, 17th Pennsylvania Cavalry, age 21.	June 21, 1864.	Comp'd comminuted fracture of right humerus, involving shoulder joint.	June 21, 1864.	Antero-posterior flap amputation at the shoulder.	Disch'd Mar. 9, 1865; pensioned.
357	Wirts, C., Pt., F, 30th Missouri.	May 20, 1863.	Shot wound of right arm.....	May 20, 1863.	Amputation at the shoulder....	Disch'd Sept. 2, 1863; pensioned.
358	Wise, A., Pt., K, 7th Maryland, age 32.	Aug. 18, 1864.	Shot wound of left shoulder, with lesion of bone and vessels.	Aug. 18, 1864.	Flap amputation at shoulder, by Surg. A. A. White, 8th Maryland.	Disch'd Feb. 5, 1865; pensioned.
359	Wispert, G., Serg't, C, 1st New Jersey Cavalry, age 23.	May 12, 1864.	Right arm carried away by a six-pound shot, which struck midway between elbow and shoulder.	May 12, 1864.	Amputated at the shoulder, by Surg. W. W. L. Phillips, 1st New Jersey Cavalry.	Returned to duty, to be mustered out, August 31, 1864; pensioned.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
360	Wood, B. S., Corp'l, C, 1st Maine Cavalry, age 31.	April 9, 1865.	Severe shot fracture of the left arm, extending nearly to the shoulder.	April 9, 1865.	Amputated at the shoulder, by Surg. G. W. Colby, 1st Maine Cavalry.	Disch'd Aug. 12, 1865; pensioned.
361	Woods, C., Pt., K, 16th Massachusetts, age 19.	May 9, 1864.	Shot comminuted fracture of upper third of right arm.	May 9, 1864.	Antero-posterior flap amputation at the shoulder, by Surg. C. C. Jewett, 16th Mass.	Disch'd Nov. 19, 1864; pensioned. *Spec.* 123, A. M. M.
362	Wright, L., Pt., H, 10th Iowa, age 21.	Nov. 25, 1863.	Fracture of left humerus in the upper third.	Nov. 25, 1863.	Amputated, by Surg. L. J. Ham, 48th Indiana.	Mustered out September 28, 1864; pensioned.
363	Yeatter, L., Pt., G, 143d Pennsylvania, age 32.	May 5, 1864.	Shot wound of left arm at upper third, with injury of vessels and bone.	May 6, 1864.	Posterior flap amputation at the shoulder, by Surgeon G. W. New, 7th Indiana.	Disch'd May 15, 1865; pensioned.
364	*Young, G. G.*, Pt., A, 7th South Carolina Cavalry.	May 30, 1864.	Shot fracture of upper third of humerus.	May 31, 1864.	Amputated at the shoulder, by Surg. C. B. Gibson, C. S. A.	Transferred June 11, 1864.
365	Young, I. J., Pt., H, 63d Indiana, age 28.	May 14, 1864.	Ball entered near the head of left humerus, passed through joint and down the side to the sixth rib, whence it was extracted.	May 15, 1864.	Lateral flap amputation at the shoulder.	Gangrene. Discharged Nov. 30, 1864; pensioned.
366	Zahrli, J., Pt., G, 97th Illinois, age 28.	May 16, 1863.	Round shot passed through the middle third of the left arm; humerus shattered.	May 16, 1863.	Amputation at the shoulder by irregular flaps.	Disch'd Feb. 3, 1864; pensioned.
367	Zimmers, H., Serg't, A, 140th Pennsylvania, age 32.	July 2, 1863.	Comminuted fracture of the left humerus.	July 3, 1863.	Amputated at the shoulder, by Surg. J. W. Wishart, 140th Pennsylvania.	Disch'd June 15, 1865; pensioned.
368	Zubler, R., Corp'l, A, 134th New York, age 21.	July 1, 1863.	Comminuted shot fracture of surgical neck of left humerus; joint opened; escape of synovia.	July 2, 1863.	Double flap amputation at the shoulder.	Disch'd May 18, 1864; pensioned.

The side injured was specified in three hundred and fifty-seven of the cases here tabulated; in eleven instances this point was overlooked. One hundred and eighty-one operations were on the left, and one hundred and seventy-six on the right side. Seven patients were returned to modified duty in the second battalion of the Veteran Reserve Corps; three hundred and three were discharged and pensioned; thirty-seven were paroled or exchanged. Twenty-one of the pensioners have died since their discharge, at periods remote from the date of operation,—one from a railroad accident, one from suicide, eight from marasmus due, probably, to the mutilation, and eleven from various diseases unconnected with the injury. The Museum possesses twenty-two specimens of shot fractures of the upper extremity of the humerus, successfully treated by primary amputation at the shoulder.[1] Seven of them have been figured on preceding pages. Moreover, the primary appearances of shot comminutions of the upper portion of the bone are largely illustrated by wood-cuts intercalated among the abstracts of cases of excisions at the shoulder.

§ *Unsuccessful Operations.*—One hundred and seventeen primary amputations at the shoulder resulted fatally. The side implicated was specified in ninety-three instances, the right limb having been removed in forty-five, and the left in forty-eight operations. Three of the cases were complicated by other capital operations, one by amputation of the thigh, another by amputation of the leg, and a third by the removal of three-fourths of the scapula. In fourteen other cases serious wounds in other parts of the body contributed toward the

[1] Guthrie (G. J.) has devoted a chapter of fifty pages (*A Treatise on Gunshot Wounds, etc.*, 3d ed., 1827, pp. 420–470) to this operation. It filled with valuable practical remarks well worthy of the attention of the military surgeon. A few passages are here quoted: "The dread formerly entertained of this operation was very great, even by men of the best abilities: * * It can never, however, again be considered formidable, except under bad management, and from extreme ignorance. The distinction between the necessity of the operation, and the possibility of avoiding it, requires in many cases the exercise of the nicest judgment, and a due consideration of attending circumstances; for there is no part of military surgery, in which an operation can be performed with more advantage at the instant; or delayed for a few days, with a view of gaining information, with more prejudice; inasmuch as the necessary incisions are made, in the first instance, in parts disposed to take on healthy actions, and in the best possible state for undergoing surgical operations; the constitution of the patient being also at that moment generally good, and able to sustain the demands upon it under untoward circumstances; or of supporting, without future injury, the restraint and control requisite for the successful accomplishment of the cure. The difference between cutting in sound and diseased parts is justly appreciated by every surgeon, both as to his personal convenience and ease in operating, as well as to the future healing of the wound; and the advantage here is particularly great, as, from the contiguity of the wound to the chest and the principal organs of life, it is advisable to avoid any excess of action; and experience has demonstrated, that the evil to be apprehended from the equilibrium of the circulation being destroyed is infinitely less than it would be at a subsequent period of three or four weeks, after high suppurative action has been going on. It cannot be too strongly impressed on the mind, that the necessary examinations should take place, and the operation be performed in those cases demanding it, as soon after the injury as possible, consistent with the state of the patient; and the surgeon should not satisfy himself with the idea of being able to accomplish it as safely, or as successfully, when suppuration has been established, and when perhaps he may have better assistance at hand; a kind of self deceit that is occasionally permitted, but which cannot be too much reprobated."

gravity of the situation. In eighteen instances the limb was nearly or completely torn away by cannon shot. The subjects of the operations were one hundred and one Union and sixteen Confederate soldiers. Two cases in the series furnished specimens to the Museum. Brief abstracts of these are appended:

CASE 1600.—Private J. K———, Co. G, 155th New York, was wounded at North Anna, Virginia, May 18, 1864. He was treated in a Second Corps hospital at Fredericksburg. Surgeon D. H. Houston, 2d Delaware, reported: "Fracture of left arm. Amputation at the shoulder joint, by Surgeon J. W. Wishart, 140th Pennsylvania. Arm severed by a cannon ball." The patient died May 21st. The specimen represented by the wood-cut (FIG. 488) was contributed by Surgeon W. O'Meagher, 69th New York, and is thus described in the 1866 Catalogue, p. 92: "The upper half of the left humerus, amputated at the shoulder joint after fracture in the middle third by a round shot. A fissure three inches in length exists in the upper and outer portion of the bone, without communicating with the seat of fracture." The fissure in the upper part, not extending to the point at which the bone was shattered by the round shot, is very curious and interesting, occurring unquestionably at the time of accident, and not in the transportation or preparation of the specimen.

FIG. 488.—Upper half of left humerus, from which the lower half was torn by round shot. *Spec.* 2323.

In robust, fleshy subjects it is sometimes exceedingly difficult to determine whether the fissures from a shot comminution of the upper third of the humerus extend within the capsule. Specimen 1082 of the Surgical Series of the Museum is a good illustration. It is represented at page 30 of the preliminary surgical report (Circular 6, 1865, FIG. 32, and Catalogue of 1866, p. 91, FIG. 44). Before the removal of the limb it was examined by several experienced and accomplished surgeons, who consented to the exarticulation in the belief that the fissures penetrated the joint. On examination, the fracture was found to reach only to about two inches below the lower border of the tuberosities. In such cases, it is far better to commence the amputation with a view to dividing the humerus in its continuity. Should fissures be found to extend to the joint, it is easy to extend the incisions upward and effect exarticulation.

CASE 1601.—Private C. J———, Co. C, 12th Massachusetts, aged 26 years, was wounded at Jericho Ford, May 23, 1864, by a conoidal musket ball, and was admitted to a Fifth Corps field hospital. Surgeon C. J. Nordquist, 83d New York, noted: "Gunshot fracture of the right humerus; disarticulation at the shoulder joint." The patient was sent to Washington and entered Emory Hospital. Surgeon N. R. Moseley, U. S. V., recorded: "Admitted May 29th, from the field. Gunshot fracture of the right humerus. Amputation at the shoulder joint, May 24, 1864, on the field, by Surgeon J. W. Rawlings, 88th Pennsylvania. Died June 10, 1864." The specimen represented by the adjoining cut (FIG. 489) was contributed by the operator. It consists of "the right humerus, shattered in the upper third of the shaft, without displacement of fragments." (See *Cat. Surg. Sect.*, 1866, p. 91.) This and the foregoing specimen, 2323, are the only examples the Museum possesses of shot comminutions of the upper part of the humerus followed by primary unsuccessful amputation. In specimen 4149 the fissures extend, on the posterior parts, quite to the anatomical neck, without crossing, however, the line of the epiphysis.

FIG. 489.—Shot fracture of the upper extremity of the right humerus. *Spec.* 4149.

In nine of the fatal cases consecutive ligation of the axillary or of the subclavian was required, a large proportion of cases of bleeding from these great trunks, tied primarily in healthy subjects. The mortality here recorded is greater than that observed by Larrey, who asserted that he had saved ninety in a hundred patients amputated at the shoulder for shot injury, but compared with the general averages[1] it is a favorable exhibit.

[1] SMITH (S.), in a careful paper in the *New York Journal of Medicine*, 1853, N. S., Vol. X, page 9, in treating of amputation at the large joints has given a good historical review, with statistics, of amputations at the shoulder. He states that the earliest instance of the performance of the operation in this country was by Dr. JOHN WARREN, in 1781 (*Boston Med. and Surg. Jour.*, Vol. XX, p. 210), at a military hospital in Boston. He doubts the assertion of Dr. S. W. WILLIAMS (*Med. Biography*, 1845, and *New York Jour. of Med.*, 1852), that Dr. JOSIAH GOODHUE, of Hadley, practised the operation yet earlier. He ascribes three exarticulations for injury to Dr. AMASA TROWBRIDGE, the first in 1809, and two to Dr. WILLIAM GIBSON, the earliest in 1812. Dr. S. SMITH collects seventy-one cases of exarticulation at the shoulder, with thirty-four deaths, a fatality of 47.9 per cent. GUTHRIE (*On Gunshot Wounds*, 3d ed., 1827, p. 469) gives the results of nineteen exarticulations at the shoulder, performed primarily on the field, from June 21st to December 24th, in the six divisions of the army of the Duke of Wellington, engaged at Vittoria, Balboa, and the siege of St. Sebastian. There was but one fatal case in nineteen amputations. Of nineteen similar ulterior operations, practised in general hospitals on wounded from the same engagements, but four were successful. BROMFIELD (*Chirurgical Observations*, 1873, Vol. I, p. 209) describes his uniform success in several cases of shoulder joint amputations, although he "had but little encouragement to do it at first from those who had seen it performed in the army, when the shoulder had been greatly injured by gunshot, and amputation at the joint was the only chance of preserving life; for, though the operations were seemingly well performed, and everything went on, to all appearance, well for near three weeks, yet, I am told, the patients all died."

TABLE XLIV.

Summary of One Hundred and Seventeen Fatal Cases of Primary Amputation at the Shoulder for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Ames, A. G., Serg't, D, 31st Maine, age 25.	May 30, 1864.	Shot fracture of right humerus at upper third.	May 30, 1864.	Arm amputated at the shoulder joint; external and internal flaps.	Died June 24, 1864, of pyæmia.
2	Andrews, M., Pt., E, 17th Vermont, age 19.	May 12, 1864.	Shot fracture of right humerus, extending into shoulder joint.	May 14, 1864.	Amputation of arm at shoulder joint, by Surgeon J. Harris, 7th Rhode Island.	July 27th, hæmorrhage; subclavian artery ligated. Died July 28, 1864, from hæmorrhage.
3	Ash, D. B., Pt., B, 19th Massachusetts.	June 25, 1862.	Wound of right arm by musket ball, implicating bloodvessels and bone.	June 25, 1862.	Amputation of arm at shoulder joint, by Surgeon J. T. Dyer, 19th Massachusetts.	Died July 25, 1862.
4	Austin, A. Y., Captain, F, 23d Ohio, age 27.	Sept. 3, 1864.	Shot fracture of the neck of the right humerus.	Sept. 4, 1864.	Amputation of arm at shoulder joint, by A. A. Surgeon J. Younglove.	Died September 5, 1864.
5	Austin, W. S., Pt., D, 27th Michigan, age 43.	July 30, 1864.	Right arm carried away by a twenty-four pound solid shot.	July 30, 1864.	Removal of arm at shoulder joint, by Surg. W. B. Fox, 8th Michigan. Triangular external flaps with apex upward.	Died September 1, 1864, from exhaustion.
6	Baldwin, R. W., Pt., C, 21st Wisconsin.	Oct. 8, 1862.	Shot fracture of the upper portion of the left humerus.	Oct. 8, 1862.	Amputation of arm at shoulder joint.	Died October 30, 1862.
7	Barry, R., Corporal, F, 1st New Jersey.	May 6, 1864.	Comp'd comminuted shot fracture of —— humerus.	May 6, 1864.	Amputation of arm at shoulder joint.	Died May 19, 1864.
8	Bates, J., Pt., A, 75th Ohio.	Aug. 22, 1862.	Ball perforated right shoulder and severely lacerated the soft parts, grooving the articular surfaces.	Aug. 22, 1862.	Amputation of arm at shoulder joint.	Patient sank rapidly. Died Aug. 29, 1862.
9	Bessimer, W., Pt., D, 137th New York.	July 3, 1863.	Fracture of left arm in upper third.	July 3, 1863.	Amputated at the shoulder by Larrey's method.	Not a pensioner; not on mortuary lists.
10	Bly, J., Lieutenant, M, 9th New York Cavalry, age 45.	May 8, 1864.	Shot wound of left arm; the upper extremity of humerus shattered.	May 8, 1864.	Amputation of left arm at the shoulder joint.	Died May 17, 1864.
11	Boneau, P., Corp'l, G, 80th Indiana, age 22.	Dec. 10, 1864.	Shot perforation of the right shoulder; head and upper extremity of shaft of humerus and scapula comminuted and shoulder joint opened.	Dec. 10, 1864.	Arm amputated at shoulder joint by oval flap method; also excision of entire lower three-quarters of scapula by extending the incision for anterior flap along spine of scapula, by A. A. Surgeon M. L. Herr.	Patient did not rally from the shock of the operation. Died December 11, 1864, from exhaustion.
12	Boyer, A., Pt., K, 19th Maine, age 22.	June 22, 1864.	Shot wound of left arm, with comminuted fracture of the shoulder joint.	June 22, 1864.	Amputation of arm at shoulder joint by Larrey's method, by Surgeon N. Hayward, 20th Massachusetts.	Died July 20, 1864, of pyæmia.
13	Brockway, O. P., Capt., A, 5th Colored Troops, age 28.	June 19, 1864.	Shot fracture of the right arm near the shoulder; head and shaft of humerus extensively comminuted.	June 21, 1864.	Amputation of arm at shoulder joint by lateral flap method, by Surg. D. G. Rush, 101st Pennsylvania.	Died June 22, 1864, from exhaustion.
14	Campbell, J., Pt., B, 1st Delaware.	May 3, 1863.	Gunshot wound of the left arm; fracture of humerus, high up.	May 5, 1863.	Amputation of arm at shoulder joint.	Died May 7, 1863.
15	Carr, L., Sergt., F, 16th West Virginia, age 26.	April 2, 1865.	Comminuted fracture of the left humerus by shell fragment.	April 2, 1865.	Arm amputated at shoulder joint, by Surgeon F. S. Ainsworth, U. S. V.	Died April 21, 1865, from exhaustion.
16	Church, F., Pt., I, 57th New York, age 20.	June 16, 1864.	Shot fracture of the left arm in upper third.	June 17, 1864.	Arm amputated at shoulder joint by lateral flaps, by Surg. G. L. Potter, 145th Penn.	Died July 15, 1864, of pyæmia.
17	Clark, C. W., Serg't, A, 67th New York, age 25.	May 6, 1864.	Shot fracture of right shoulder joint.	May 6, 1864.	Amputation of arm at shoulder.	Furloughed June 9, 1864. Died at his home in Brooklyn, while on furlough, July 23, 1864.
18	*Compton, J. A.*, Pt., K, 3d South Carolina.	.....	Shot wound of the left arm; compound fracture.	.....	Primary amputation of the arm at the shoulder joint.	Erysipelas. Died May 22, 1864, of pyæmia.
19	Comstock, G., Pt., F, 111th Pennsylvania.	May 3, 1863.	Left arm blown off by shot....	May 3, 1863.	Amputation of the arm at the shoulder joint.	Died May 5, 1863.
20	Conant, A. E., Pt., K, 8th Maine, age 22.	May 20, 1864.	Shot wound of the left arm, the head of humerus fractured.	May 20, 1864.	Amputation of the arm at the shoulder joint.	May 24th and 25th, hæmorrhage. May 26th, ligation of subclavian artery, by A. A. Surg. T. Siebold. Died May 29, 1864, from exhaustion.
21	Conner, A., Pt., C, 3d Batt., 18th Infantry.	Dec. 31, 1862.	Shot wound of the left arm, the humerus shattered.	Dec. 31, 1862.	Amputation of arm at shoulder joint.	Died January 10, 1863.
22	*Copeland, V.*, Lieutenant, H, 2d North Carolina Cavalry.	.....	Shot wound of —— arm, with fracture of humerus near joint.	.....	Primary amputation of arm at shoulder joint.	Died December 6, 1863.
23	Corrie, J. S., Serg't, A, 11th Missouri, age 25.	May 22, 1863.	Shot fracture of left humerus in its upper third.	May 22, 1863.	Amputation of arm at shoulder joint, by Surg. M. W. Fisk, 11th Missouri.	Hæmorrhage. June 7th, axillary artery ligated; 8th, branches of acromial thoracic artery ligated. Died June 9, 1863, from effects of hæmorrhage.
24	Cotrell, J., Pt., A, 43d New York, age 32.	July 3, 1863.	Shot fracture of the left arm near the shoulder joint.	July 3, 1863.	Amputation of arm at shoulder joint.	Died August 13, 1863, of rheumatism of the heart.
25	Cramer, J., Pt., A, 187th New York.	Oct. 27, 1864.	Shot wound of the left shoulder, with fracture.	Oct. 27, 1864.	Amputation of arm at shoulder joint.	Died October 29, 1864.
26	*Crawley, M.*, Pt., Young's Virginia Battery, age 19.	Aug. 21, 1864.	Shot fracture of left humerus near the articulation.	Aug. 22, 1864.	Amputation of arm at shoulder joint.	Hæmorrhage Sept. 1st and 2d. Died Sept. 3, 1864.
27	Crittend, E., Pt., F, 11th Penn'a Reserves, age 22.	May 8, 1864.	Left arm shattered by shell fragment.	May 8, 1864.	Amputation of arm at shoulder joint by anterior flap method.	Typhoid symptoms. Died May 28, 1864.
28	Crotty, J. B., Pt., D, 108th New York.	Dec. 13, 1862.	Shell wound of the right arm, with fracture of the humerus.	Dec. 13, 1862.	Amputation of arm at shoulder joint.	Died December 21, 1862.
29	*Davis, J. L.*, Pt., 2d South Carolina, age 20.	Sept. 17, 1862.	Comminuted fracture of neck and shaft of left humerus by a conoidal ball.	Sept. 18, 1862.	Flap amputation of arm at the shoulder joint.	Died Sept. 25, 1862, of pyæmia.[1]

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
30	Dennis, A., Pt., C, 24th New York Cavalry.	Aug. 19, 1864.	Comminuted fracture of left shoulder by fragment of shell; laceration of soft parts.	Aug. 19, 1864.	Amputation at shoulder joint, by Surg. W. C. Shurlock, 51st Pennsylvania.	Died August 21, 1864.
31	Derolph, C., Pt., K, 93d Pennsylvania, age 20.	June 3, 1864.	Shot fracture of neck of right humerus.	June 3, 1864.	Amputation of arm at shoulder joint.	Died June 12, 1864.
32	Dyer, H. P., Color Sergeant, 21st Maine.	May 27, 1863.	Shot perforations of the head of the right humerus, the right arm, the right hand, and the upper lip.	May 28, 1863.	Amputation of arm at shoulder joint, by Surg. G. E. Brickett, 21st Maine.	Died Aug. 19, 1863, from diarrhœa.
33	Ely, A. S., Lieut., F, 20th Pennsylvania Cavalry.	April 6, 1865.	Shot wound of the left arm, the humerus shattered high up.	April 6, 1865.	Amputation of arm at shoulder joint.	Died April 6, 1865.
34	Emig, J., Pt., C, 166th Pennsylvania.	April 15, 1863.	Comminuted shot fracture of the right humerus.	April 15, 1863.	Amputation of the arm at the shoulder joint by oval incision.	Died April 17, 1863.
35	Emerson, N., Serg't, K, 25th New York.	May 27, 1862.	Shot wound of —— arm, with fracture of the humerus and injury of vessels.	May 27, 1862.	Amputation of arm at shoulder joint by Lisfranc's method.	Died June, 1862.
36	French, C. R., Pt., K, 1st Artillery, age 19.	July 6, 1863.	Musket ball fractured the left shoulder joint.	July 6, 1863.	Arm amputated at the shoulder joint by the oval method.	Died July 14, 1863, of gangrene.
37	*Gibson*, W., Pt., C, 9th Alabama Cavalry.	June 24, 1864.	Musket ball fractured upper third of left humerus, passed through axillary space and upper lobe of left lung, and lodged.	June 24, 1864.	Amputation of the arm at the shoulder joint by transfixion.	Died June 27, 1864.
38	Goodel, J. V., Pt., C, 8th Vermont, age 21.	Oct. 19, 1864.	Shot wound of the middle third of the right arm, with longitudinal splintering.	Oct. 20, 1864.	Amputation at the shoulder joint by the oval method.	Died November 28, 1864.
39	*Graves, H.*, Pt., C, 6th Alabama.	July 3, 1863.	Shot fracture of the right arm in upper third.	July 4, 1863.	Arm amputated at the shoulder joint, by Surg. G. B. Lecompte, 1st Maryland, E. S.	Died July 26, 1863.
40	Greek, E., Pt., I, 34th New York.	Sept. 17, 1862.	Shot wound of shoulder joint, with fracture of the humerus.	Sept. 17, 1862.	Removal of arm at the shoulder joint by double flaps.	Died October 7, 1862.
41	Green, J. W., Pt., D, 2d Ohio.	Oct. 8, 1862.	Shot fracture of arm near the shoulder.	Oct. 8, 1862.	Amputation of the arm at the shoulder joint.	Died November 6, 1862.
42	Gregg, J. H., Capt., I, 137th New York.	July 2, 1863.	Gunshot wound of left shoulder and breast.	July 3, 1863.	Amputation of left arm at the shoulder joint, by Surg. A. K. Fifield, 29th Ohio.	Died July 3, 1863, eight hours after operation.
43	Gruff, H., Pt., A., 60th Indiana.	July 10, 1863.	Shot fracture of the scapula and neck and shaft of humerus.	July 10, 1863.	Amputation of the arm at the shoulder joint by transfixion.	Died September 15, 1864.
44	Hall, J., Pt., G, 3d Iowa....	April 7, 1862.	Shot wound involving left lung and upper third of the left humerus.	April 7, 1862.	Amputation of the arm at the shoulder joint by double flaps.	Died April 23, 1862, from exhaustion.
45	Hannan, J., Adjutant, 96th Pennsylvania, age 48.	June 1, 1864.	Shot fracture of the head of right humerus.	June 1, 1864.	Arm amputated at the shoulder joint; antero-posterior flaps.	Died July 7, 1864, from exhaustion.
46	Hathaway, O. P., Pt., I, 7th Rhode Island, age 43.	June 17, 1864.	Shot wounds of the right arm and shoulder.	June 17, 1864.	Arm amput'd at shoulder joint; internal and external flaps.	Died June 24, 1864, from exhaustion.
47	Haybecker, J. W., Pt., F, 143d Pennsylvania, age 33.	June 3, 1864.	Shot fracture of the right humerus, involving the entire shaft.	June 3, 1864.	Arm amputated at the shoulder joint, by Surg. F. C. Reamer, 143d Pennsylvania.	Died July 30, 1864.
48	Hoffman, J., Pt., E, 75th New York.	May 27, 1863.	Shot wound of the right arm, with fracture high up.	May 27, 1863.	Arm amputated at the shoulder joint.	Died May 31, 1863.
49	Hollingsworth, J., Pt., B, 3d New Jersey.	Sept. 14, 1862.	Compound fracture of the upper third of left humerus.	Sept. 14, 1862.	Removal of arm at the shoulder joint.	Died October 29, 1862.
50	Homer, J. P., Pt., A, 139th Pennsylvania.	May 12, 1864.	Shot fracture of right shoulder joint.	May 12, 1864.	Removal of arm at the shoulder joint.	Died June 25, 1864.
51	*Hufftickler, E.*, Pt., I, 38th Mississippi, age 38.	May 15, 1864.	Shot comminution of the left humerus; laceration of soft parts.	May 15, 1864.	Amputation of the arm at the shoulder joint.	Died June 5, 1864, with cerebral symptoms.[1]
52	H——, D., Pt., D 6th Kentucky, age 24.	April 6, 1862.	Left arm carried away by cannon ball, leaving only the head and upper end of the bone.	April 6, 1862.	Amputation at shoulder joint, by Surgeon R. R. Stevenson, P. A. C. S.	Died July 16, 1862, of pyæmic fever.[2]
53	Johannes, C., Pt., C, 12th Massachusetts, age 26.	May 23, 1864.	Shot fracture of the head of the upper third of right humerus; no displacement of fragments.	May 24, 1864.	Amputation of the arm at the shoulder joint, by Surg. J. W. Rawlings, 88th Pennsylvania.	Died June 10, 1864. *Spec.* 4149.
54	Kearn, J., Pt., G, 155th New York.	May 18, 1864.	Shot fracture of left arm by a cannon ball.	May 18, 1864.	Arm amputated, by Surg. J. W. Wishart, 140th Penn.	Died May 21, 1864. *Spec.* 2323, A. M. M.
55	Kearnes, J., Serg't, G, 94th New York.	July 15, 1864.	Shot wound of the arm, with fracture of upper third of the humerus.	July 15, 1864.	Amputation of the arm at the shoulder joint by the oval method.	Died July 19, 1864.
56	Kenyon, J. R., Corp'l, M, 2d New York Artillery, age 45.	June 16, 1864.	Shot fracture of the head of left humerus.	June 17, 1864.	Amputation of the arm at the shoulder joint, by Surg. J. W. Wishart, 140th Pennsylvania.	Died July 4, 1864.
57	Kies, A., Pt., C, 12th New York Cavalry.	Mar. 10, 1865.	Compound shot fracture of the upper third of left humerus, and flesh wound of cheek by shell fragments.	Mar. 10, 1865.	Amputation of arm at shoulder joint by Scoutellen's method.	Died March 20, 1865, from exhaustion.
58	Kimberlin, M., Pt., I, 14th Kentucky.	June 4, 1864,	Comminuted fracture of right humerus by a conoidal ball.	June 4, 1864.	Amputation of arm at shoulder joint, by Surgeon E. Skippen, U. S. V.	Died June 18, 1864.
59	Lake, L. C., Pt., C, 21st Wisconsin.	Oct. 8, 1862.	Shot fracture of left humerus, high up.	Oct. 8, 1862.	Amputation of arm at shoulder joint by Larrey's plan.	Died November 4, 1862.
60	Langdon, G., Corp'l, D, 78th Pennsylvania, age 26.	Oct. 1, 1862.	Shot fracture of right humerus; bone badly shattered and soft parts greatly injured.	Oct. 2, 1862.	Arm amputated at the shoulder joint by transfixion.	Died October 10, 1862, of tetanus.
61	Lee, P., Serg't, D, 28th Kentucky, age 28.	Feb. 24, 1864.	Comminuted fracture of the upper third of left humerus, involving the shoulder joint, by a fragment of shell.	Feb. 26, 1864.	Arm amputated at the shoulder joint, by Surgeon F. Salter, U. S. V.	Died March 15, 1864, from exhaustion.
62	*Loomis, W. D.*, Pt., B, 53d Georgia, age 22.	July 3, 1863.	Comp'd comminuted shot fracture of left shoulder, with perforation of left lung.	July 3, 1863.	Amputation of arm at shoulder, by Surg. J. J. Knott, P. A. C. S.; Larrey's oval method.	Died July 15, 1863.
63	McCarthy, C., Pt., K, 72d Pennsylvania.	July 3, 1863.	Shot wound of right shoulder, with lesion of bone.	July 3, 1863.	Arm amputated at the shoulder joint, by Surg. M. Rizer, 72d Pennsylvania.	Died July 12, 1863.

64	McCarthy, D., Pt., K, 122d New York.	July 3, 1863.	Shot wound of arm and fracture of the humerus.	July 3, 1863.	Amputation of arm at shoulder joint by the oval method.	Died July 6, 1863.
65	McCauslin, J., Pt., D, 72d Pennsylvania.	July 3, 1863.	Shot fracture of right humerus in upper third.	July 3, 1863.	Amputation of arm at shoulder joint, by Surg. M. Rizer, 72d Pennsylvania.	Died July 26, 1863.
66	McDaniels, J., Pt., D, 31st Indiana.	July 4, 1864.	Shot fracture of forearm and shoulder joint.	July 4, 1864.	Arm amputated at shoulder, by Surg. C. J. Walton, 21st Kentucky.	Died July 4, 1864.
67	McDowell, S., Pt., M, 11th Indiana, age 19.	Jan. 16, 1865.	Shot wound of shoulder.....	Jan. 18, 1865.	Amputation of arm at shoulder joint by antero-posterior flaps; Surg. J. Evans, 13th Wis.	Died April 30, 1865.
68	Mulone, S., Pt., C, 41st New York, age 30.	Dec. 13, 1862.	Shot wound of left arm.....	Dec. 13, 1862.	Arm amputated at the shoulder joint.	Died Jan. 2, 1863, from tetanus.
69	Marquis, W. H., Pt., E, 85th Pennsylvania, age 20.	Aug. 27, 1863.	Compound fracture of right arm and left leg by shell.	Aug. 27, 1863.	Amputation of right arm at the shoulder joint and amputation of left leg.	September 12th, hæmorrhage from brachial artery; axillary artery ligated on face of stump. Died September 12, 1863.
70	Measic, H., Pt., E, 160th New York.	Sept. 19, 1864.	Right arm nearly torn off by shell.	Sept. 19, 1864.	Amputation of the arm at the shoulder joint.	Died September 22, 1864.
71	*Moore*, *A. J.*, Pt., G, 35th Georgia.	June 13, 1864.	Fracture of head of humerus by a conoidal ball.	June 13, 1864.	Amputation of arm at shoulder, by Surgeon Mont, C. S. A.	Died June 15, 1865.
72	Morgan, W., Pt., F, 126th New York, age 22.	July 2, 1863.	Compound shot fracture of the humerus.	July 3, 1863.	Arm amputated at the shoulder joint by double flap.	July 19th, hæmorrhage from axillary artery; ligation. Died July 19, 1863.
73	*Mosby*, *T.*, Pt., F, 5th Alabama, age 21.	Oct. 19, 1864.	Shot wound of shoulder, with fracture.	Oct. 19, 1864.	Amputation of the arm at the shoulder.	Died Oct. 23, 1864, from shock and loss of blood.
74	Nickerson, J. T., Serg't, F, 4th Maryland.	Aug. 18, 1864.	Shot comminuted fracture of left humerus.	Aug. 19, 1864.	Flap amputation of arm at the shoulder joint.	Died September 13, 1864.
75	Noble, E. C., Pt., M, 1st Michigan Engineers.	Oct. 8, 1862.	Shot fracture of upper portion of humerus.	Oct. 8, 1862.	Amputation of the arm at the shoulder by oval incisions.	Died October 19, 1862.
76	Noble, J. C., Pt., B, 149th Pennsylvania.	May 3, 1863.	Shot wound of shoulder, with lesions of soft parts and fracture.	May 3, 1863.	Arm amputated at the shoulder by external and internal flaps.	Died May 4, 1863.
77	O'Brien, P., Corp'l, G, 29th Wisconsin.	April 9, 1864.	Shot wound of the right shoulder joint.	April 9, 1864.	Arm amputated at the shoulder.	Died April 18, 1864, from hæmorrhage.
78	Odell, J. S., Pt., D, 39th Illinois, age 25.	June 2, 1864.	Head of the left humerus completely shattered by a conoidal ball.	June 2, 1864.	Amputation of arm at shoulder joint.	Died June 28, 1864, from gangrene.
79	Odell, C. M., Pt., I, 36th Wisconsin.	June 3, 1864.	Gunshot fracture of head and upper half of shaft of the humerus.	June 3, 1864.	Amputation at shoulder joint..	Died June 3, 1864, from chloroform, on operation table.
80	O'Hara, T., Pt., D, 63d New York.	Sept. 17, 1862.	Shot wound of right arm, with fracture of upper third of the humerus.	Sept. 17, 1862.	Amputation of arm at shoulder joint.	Hæmorrhage from axillary artery. Died Sept. 22, 1862.
81	Ordway, W. J., Serg't, A, 36th Illinois.	May 24, 1864.	Shot wound of right arm, with lesions of the bone and of the bloodvessels.	May 24, 1864.	Amputation at the shoulder, by Surgeons H. E. Hasse, 24th Wisconsin, and B. G. Pierce, 96th Illinois.	Died June 12, 1864.
82	Patton, J. W., Major, 145th Pennsylvania.	May 3, 1863.	Compound shot fracture of left humerus; neck comminuted and fissures extending down shaft to near the elbow.	May 4, 1863.	Amputation of arm at shoulder, by Surg. C. S. Wood, 6th New York.	Died May 15, 1863.
83	Phillips, J. M., Pt., H, 140th Pennsylvania, age 23.	July 2, 1863.	Comminution of upper third of left humerus by shell.	July 3, 1863.	Arm amputated at the shoulder joint.	Wound healed. Transferred Oct. 5, 1863. 'Died at Harrisburg, Dec. 17, 1863.
84	Pomeroy, E. C., Pt., B, 101st Ohio, age 21.	June 21, 1864.	Shot fracture of right arm in upper third.	June 21, 1864.	Amputation of arm at shoulder joint, by Surg. C. J. Walton, 21st Kentucky.	Died June 29, 1864, of pyæmia.
85	*Prestidge*, *G. W.*, Pt., D, 44th Alabama, age 28.	June 2, 1864.	Compound comminuted shot fracture of humerus.	June 2, 1864.	Amputation of arm at shoulder joint; flaps made of deltoid muscle.	June 30th, almost entirely well. Died July 5, 1864.
86	Pullis, J., Pt., A, 1st New York Artillery, age 18.	June 5, 1864.	Shot wound of left arm, with fracture of upper third of the humerus.	June 5, 1864.	Flap amputation at shoulder joint, by a Confederate surgeon.	Died January 30, 1865.
87	Rand, W. J., Pt., K, 45th Massachusetts, age 25.	Dec. 14, 1862.	Shot fracture of left humerus near shoulder, and of lower third of right femur; solid shot.	Dec. 14, 1862.	Arm amputated at shoulder joint, and the thigh at middle third, by Surg. L. F. Galloupe, 17th Massachusetts.[1]	Wound at shoulder had healed, and stump of thigh nearly so, when intermittent fever set in followed by pyæmia. Died January 24, 1863.
88	Rankel, F., Corp'l, A, 77th Pennsylvania, age 46.	Dec. 16, 1864.	Shot wound of the right arm, with injury to the vessels and bone.	Dec. 16, 1864.	Amputation of arm at shoulder joint.	Died January 14, 1865.
89	Reed, A., Pt., B, 6th Massachusetts, age 18.	Jan. 30, 1863.	Right arm carried away from near shoulder joint by solid shot; profuse hæmorrhage.	Jan. 30, 1863.	Disarticulation at the shoulder joint, by Surg. G. C. Harlan, 11th Penn. Cav. Barely sufficient flap was obtainable to cover stump. Flaps sloughed. Feb. 6th, profuse hæmorrhage. Feb. 7th, subclavian artery ligated, by Ass't Surg. O. M. Humphrey, 6th Mass.[2]	Died, from exhaustion, February 27, 1863.
90	*Richards*, *H. L.*, Pt., H, 58th Alabama.	May 15, 1864.	Gunshot fracture of upper third of left humerus.	May 15, 1864.	Amputation at shoulder, by Surg. W. R. Longshore, 147th Pennsylvania.	Died Sept. 20, 1864, of pyæmia.
91	Rutter, W., Pt., C, 1st Pennsylvania Rifles, age 24.	June 18, 1864.	Shot fracture of left arm	June 18, 1864.	Lateral flap amputation at the shoulder joint.	Died July 25, 1864, from recurrent hæmorrage.
92	Sawyer, D., Pt., D, 31st Maine, age 33.	July 30, 1864.	Shot comminuted fracture of head of left humerus.	July 30, 1864.	Amputation at shoulder joint by Lisfranc's method, by Surg. J. B. Mitchell, 31st Maine. Aug. 8-9th, axillary artery ligated, by Ass't Surg. W. F. Norris, U. S. A. Aug. 9th, axillary artery again tied, by Ass't Surg. W. Thomson, U. S. A.	Died August 9, 1864, five hours after last operation.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
93	Schley, E., Pt., K, 1st New Jersey Cavalry, age 23.	May 29, 1864.	Shell wound of the right arm, with lesions of bone and vessels near shoulder.	May 29, 1864.	Flap amputation at shoulder joint.	Died June 25, 1864, of pyæmia.
94	Sears, J., Serg't, I, 93d New York, age 32.	Aug. 16, 1864.	Fracture of the right arm; ball penetrated thorax.	Aug. 16, 1864.	Amputation of arm at shoulder.	Died August 21, 1864.
95	Shanks, J., Pt., K, 11th Kentucky.	Dec. 31, 1862.	Gunshot wound of arm, with injury of the bone and vessels.	Dec. 31, 1862.	Amputation of arm at shoulder joint.	Died January 5, 1863.
96	*Shaw, T. C.*, Lieut., C, 2d Tennessee, age 20.	Dec. 16, 1864.	Shot fracture of head of the left humerus.	Dec. 18, 1864.	Antero-posterior flap amputation of arm at shoulder, by Ass't Surg. W. Trull, U. S. V.	Died December 24, 1864.
97	Sheridan, P., Pt., K, 6th N.Y. Heavy Artillery, age 25.	Oct. 19, 1864.	Shot wound of upper third of left arm.	Oct. 20, 1864.	Antero-posterior flap amputation at shoulder.	Died Oct. 27, 1864, from exhaustion.
98	Shill, C., Pt., G, 207th Pennsylvania, age 23.	April 2, 1865.	Shot fracture of right humerus; also shot wound of neck and fracture of lower jaw.	April 2, 1865.	Amputation of arm at shoulder.	Died April 6, 1865; autopsy revealed mortification extending into neck.
99	Slack, W. H., Pt., D, 11th Connecticut, age 41.	Mar. 14, 1862.	Left humerus comminuted by a grapeshot.	Mar. 14, 1862.	Amputation at shoulder joint, by Surg. G. Derby, 23d Mass.	Died March 22, 1862, of pyæmia.
100	Slater, I. M., Lieut., D, 88th Indiana, age 42.	Mar. 19, 1865.	Shot fracture of upper third of right arm.	Mar. 19, 1865.	Amputation of arm at shoulder joint by Lisfranc's method.	Died April 26, 1865, of pyæmia.
101	Sweeney, H., Pt., A, 55th Pennsylvania, age 22.	June 18, 1864.	Shot fracture of upper third of left humerus.	June 19, 1864.	Flap amputation at shoulder joint, by Surg. G. T. Stevens, 77th New York.	Died February 19, 1865.
102	S——, C.....	Dec. 29, 1862.	Shot fracture of humerus in upper third.	Dec. 29, 1862.	Amputation of arm at shoulder joint.	Died four days after operation.
103	Tompkins, J., Pt., A, 77th Illinois.	Jan. 11, 1863.	Shot wound of the right shoulder, with injury of bone.	Jan. 11, 1863.	Amputation at shoulder joint, by Surg. J. B. Sparks, 19th Ky.	Died January 15, 1863.
104	*Turner, W. J.*, Pt., K, 42d Georgia, age 37.	Dec. 16, 1864.	Shell fracture of the head and entire upper third of the right humerus.	Dec. 17, 1864.	Arm amputated at shoulder, by A. A. Surg. R. L. McClure.	Died January 2, 1865.
105	Valence, H., Pt., C, 22d Kentucky.	Dec. 29, 1862.	Shot wound of right shoulder through capsule of joint; humerus shattered for five inches.	Dec. 29, 1862.	Amputation of arm at shoulder joint.	Died January 5, 1863.
106	Van Gasback, —., Pt., 11th New York Battery, age 23.	June 6, 1864.	Shot fracture of upper part of left humerus.	June 6, 1864.	Amputation of arm at shoulder joint. June 18th, hæmorrhage from axillary artery; ligation. June 23d, hæmorrhage recurred; artery religated.	Died of exhaustion June 23, 1864.
107	Wade, J. J., Corp'l, I, 40th Iowa.	Apr'l 10, 1864.	Gunshot fracture of humerus, extending into surgical neck.	April 10, 1864.	Amputation of arm at shoulder joint, by Surg. J. E. Lynch, 1st Missouri Cavalry.	Died April 15, 1864.
108	*Whisenant, R. H.*, Pt., F, 17th South Carolina, age 39.	July 30, 1864.	Shot fracture of right arm, middle third, with laceration of soft tissues.	July 30, 1864.	Amputation of arm at shoulder joint, by Surgeon G. S. West, C. S. A.	Died August 1, 1864.
109	White, F. Q., Pt., E, 80th Indiana.	Oct. 8, 1862.	Shot fracture of arm in upper third.	Oct. 8, 1862.	Amputation at shoulder joint by transfixion.	Secondary hæmorrhage. Died November 6, 1862.
110	White, J. S., Pt., F, 140th Pennsylvania, age 22.	May 4, 1864.	Shell wound of head and neck of right humerus; severe flesh wound of left forearm.	May 4, 1864.	Amputation of arm at shoulder, by Surgeon J. W. Wishart, 140th Pennsylvania.	Secondary hæmorrhage. Died June 13, 1864.
111	Whiteman, W., Corp'l, K, 6th West Virginia.	Mar. 9, 1863.	Minié ball perforated the right arm near the shoulder joint, cutting brachial artery and basilic vein and splitting the humerus.	Mar. 10, 1863.	Amputation at shoulder joint by double flaps.	Died March 11, 1863, from exhaustion.
112	Wiesser, H. H., Corp'l, F, 27th Massachusetts, age 34.	June 15, 1864.	Upper third of left arm shattered by shell fragment.	June 15, 1864.	Amputation at shoulder joint. July 13th, hæmorrhage; axillary artery ligated, by Ass't Surg. E. Curtis, U. S. A.; recurred Aug. 5th and 6th; subclavian ligated by same operator.	Died August 17, 1864, from exhaustion.
113	Woodward, E., Pt., I, 20th Massachusetts.	Dec. 13, 1862.	Shot wound of the shoulder, with lesions of bone and blood-vessels.	Dec. 13, 1862.	Amputation at the shoulder by antero-posterior flaps.	Died soon after the operation. See *Rec. Mass. Vols.*, 1861–5, Vol. II, p. 363.
114	Woolery, W., Pt., C, 71st Ohio, age 27.	Dec. 16, 1864.	Shot fracture of upper third of right humerus, extending into joint.	Dec. 17, 1864.	Antero-posterior flap amputation at shoulder, by A. A. Surgeon J. E. Link.	Died December 18, 1864, from exhaustion.
115	*Worsham, D. E.*, Pt., D, 30th Georgia, age 19.	Dec. 16, 1864.	Comminuted shot fracture of the head and upper third of shaft of left humerus.	Dec. 18, 1864.	Amputation of arm at shoulder, by A. A. Surgeon R. L. McClure.	Died February 4, 1865.
116	Wright, W. W., Capt., F, 112th Illinois, age 44.	May 27, 1864.	Shot fracture of right humerus, upper third.	May 27, 1864.	Amputation of arm at shoulder; antero-posterior flaps; Surg. L. D. Griswold, 103d Ohio.	Died June 24, 1864, of pyæmia.
117	Young, J. C., Pt., A, 101st Indiana.	Mar. 20, 1863.	Shot wound of arm in upper third; bone shattered and vessels injured.	Mar. 20, 1863.	Amputation of arm at shoulder joint by the oval method.	Died May 2, 1863.

The causes of the fatal results in this series of one hundred and seventeen amputations are not particularly specified in more than half of the instances. Consecutive hæmorrhage is assigned as the cause of fatality in twelve cases, including nine in which large trunks were tied. The existence of pyæmia was verified by autopsy in thirteen cases, and suspected in seventeen other instances. Two patients succumbed to tetanus. Death in one case was ascribed to the effects of inhalation of chloroform. Gangrene, extending to the trunk, proved fatal in three cases. Cerebritis, cardiac disorder, and diarrhœa are each credited with a fatal result. Exhaustion from surgical fever or from protracted suppuration is most commonly referred to as the cause of death, and it is plain that a number of patients perished

from one or more of the various sources of insalubrity incident to over-crowded and badly policed field hospitals.

§ *Operations with Unknown Results.*—It was impracticable to ascertain the terminations of fourteen of the primary amputations at the shoulder joint for shot injury. Seven of these were practised on Union and seven on Confederate soldiers. The few facts collected regarding these cases are stated in the following table:

TABLE XLV.

Summary of Fourteen Cases of Primary Amputation at the Shoulder for Shot Injury in which the Results are Unknown.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Remarks.
1	Batcher, W. H., Corp'l, B, 86th New York.	May 5, 1864.	Shot fracture of shoulder joint.	May 6, 1864.	Amputated at the shoulder by double flap.	Not a pensioner; not on mortuary lists.
2	Bensinger, J., Pt., F, 72d Ohio.	July 13, 1864.	Shot fracture of left arm	July 13, 1864.	Amputation of arm at shoulder joint.	.....
3	*Butts, A. S.*, Serg't, 12th Virginia Cavalry.	Jan. 11, 1865.	Wound of left arm and chest; humerus shattered.	Jan. 11, 1865.	Amputated at the shoulder by antero-posterior flaps.	Left at Beverly, W. Va., when evacuated, January 11, 1865.
4	*Dew, W.*, Lieut., E, 24th Virginia.	June 15, 1864.	Shot fracture of head of left humerus.	June 15, 1864.	Amputated at the shoulder by Lisfranc's method.	Transferred June 19, 1864.
5	*Floyd, J. W.*, Pt., Grundy's Virginia Battery, age 23.	May 1, 1863.	Right arm carried away above elbow by shell.	May 1, 1863.	Amputated at the shoulder by the oval plan.	May 8, 1863, wound suppurating freely and looking healthy.
6	*Harrison, J. H.*, Pt., I, 26th Georgia.	May 19, 1864.	Shot fracture of the right arm; severe laceration and splintering.	May 19, 1864.	Amputated at the shoulder by double flaps.	Sent to Richmond hospitals.
7	J——, J.....	Dec. 29, 1862.	Shot comminution of humerus.	Dec. 29, 1862.	Amputated at the shoulder....	"Did well."
8	*Lewis, J. G.*, Pt., E, 44th Georgia.	May 11, 1864.	Shot fracture of right arm in upper third.	May 11, 1864.	Amputated at the shoulder by transfixion.	"Sent south by rail."
9	*Lorick, W. G.*, Serg't, E, 42d Mississippi, age 26.	May 5, 1864.	Wound in upper third of arm, with injury of bone and vessels.	May 6, 1864.	Amputated at the shoulder by double flaps.	"Sent south by rail."
10	Mallard, C., Pt., 41st New York.	Oct. 19, 1864.	Shot wound of right shoulder; entire shaft of humerus comminuted; wound of knee.	Oct. 19, 1864.	Amputated, by Surg. G. F. Stevens, 77th New York.	Probably died in transit to base hospital.
11	Miller, J., Pt., 43d Colored Troops.	July 30, 1864.	Wounds of left shoulder and right hand by spherical case shot.	July 30, 1864.	Amputated at the shoulder, by Surg. F. M. Weld, 27th C. T.; also amputation of the right thumb.	Not a pensioner; not on mortuary lists.
12	*Pagett, T. H.*, Pt., F, 28th Virginia.	May 16, 1864.	Shot fracture of surgical neck of humerus, with laceration of soft parts.	May 16, 1864.	Amputated at the shoulder, by Surg. E. J. Habersham, C. S. A.	June 17, 1864, not doing well.
13	V——, C.....	Dec. 29, 1862.	Shot fracture of humerus in upper third.	On field	Amputated at the shoulder by oval incision.	"Did well on fifth day."
14	Welsh, A., Pt., B, 152d New York.	May 12, 1864.	Shot fracture of left shoulder joint.	May 12, 1864.	Amputated, by Surg. M. Rizer, 72d Pennsylvania.	Not a pensioner; not on mortuary lists.

Four of the amputations were on the right and five on the left side; in five instances this point was not reported. Three cases were complicated by other severe injuries. No consecutive operations were reported in any of the series of primary amputations.

Even were all of these fourteen undetermined cases reckoned as fatal, which is a highly improbable conclusion, the mortality rate of the four hundred and ninety-nine primary amputations enumerated in the three preceding tables would not exceed the percentage of 26.2. The results of primary exarticulation at the shoulder joint for shot injury may, therefore, be regarded as eminently satisfactory.

Intermediary Amputations at the Shoulder Joint.—Operations practised from the third to the thirtieth day, inclusive, are comprised in this group. By this arrangement, it is probable that some cases that really belong to the series of primary operations are included; for it is well known that severe inflammatory symptoms are not frequently delayed much longer than forty-eight hours after the reception of injury. But data for determining this point in individual cases are not accessible to any extent, and it is necessary to draw an arbitrary line and to fix precise dates. One hundred and fifty-seven patients underwent exarticulation at the shoulder during the intermediary period: eighty-five recovered, and seventy-two, or 45.8 per cent., died.

§ *Successful Cases.*—Seventy-seven of the eighty-five successful intermediary amputations were practised on Union soldiers, seventy-six of whom were pensioned. Ten of these died subsequent to their discharge from service, at periods comparatively remote from the dates of injury, one from suicide, and nine from various diseases apparently without immediate connection with the mutilations to which they had been subjected. Eight of the operations were practised on Confederate soldiers, who were paroled or exchanged.

The following are examples of successful early intermediary amputations at the shoulder joint, for complications following fractures of the upper part of the humerus:

CASE 1602.—Corporal W. M. Nesbit, Co. D, 4th Vermont, aged 31 years, was wounded at Spottsylvania, May 12, 1864. He was admitted to a Sixth Corps field hospital on the same day. Surgeon S. J. Allen, 4th Vermont, diagnosticated a "gunshot laceration of the upper part of the left arm." Amputation at the shoulder joint was performed on May 16th. He was transferred to Sickels Hospital, Alexandria, on the 27th. Surgeon T. Rush Spencer, U. S. V., recorded: "Gunshot wound. Amputation of left arm at shoulder joint." The patient was subsequently treated in hospitals at Brattleboro', Burlington, and Montpelier, Vermont. Surgeon Henry Janes, U. S. V., contributed the photograph represented by the cut (FIG. 490), accompanied by the following memoranda: "Admitted to Sloan Hospital, Montpelier, June 14, 1865. Was wounded by a rifle ball, which shattered the head of the humerus, in consequence of which the arm was amputated at the shoulder joint. The wound healed readily, except two small places, which discharged until the summer of 1865. No necrosed bone could be detected. He was discharged from the service July 29, 1865, with the stump healed, and in good health." This soldier was pensioned from the date of his discharge; his pension was paid him March 4, 1875. There is no evidence on file of the present condition of the shoulder. The pensioner received money compensation in lieu of an artificial limb.

FIG. 490.—Cicatrix of an intermediary exarticulation of the left shoulder, a year after the operation.

In the next case, the mutilation produced such profound mental depression as to lead to the commission of suicide:

CASE 1603.—Private Henry F. Keyes, Co. E, 12th New Hampshire, aged 22 years, was wounded at Chancellorsville, May 3, 1863. He was sent to Washington, and entered Lincoln Hospital on the 6th. Acting Assistant Surgeon James N. Hyde, jr., reported: "Wounded by a ball, from an enemy forty or fifty yards distant, while he was kneeling on his right knee, in the act of firing his piece, his right hand grasping the breech. The ball entered the right arm in its upper third; passed through, comminuting the bone, and escaped at an opposite point posteriorly. May 7th: The patient was anæsthetized in the afternoon, and an examination was made of the wound with a view to operation. Many pieces of bone were removed, when an incision was made, and it was found that eight inches of the humerus was involved in the fracture. Amputation was performed immediately, by Surgeon G. S. Palmer, U. S. V., at the shoulder joint, by double antero-posterior flaps. May 8th: Water dressing and isinglass plaster; wound granulating finely; discharge healthy; no constitutional disturbance. June 13th: Wound cicatrizing nicely; granulations red; no pain; appetite good; sleeps well; respiration 20; pulse 88; bowels regular. June 23d: Water dressing and isinglass plaster; about all cicatrized; scar at the widest not more than four or five lines; very healthy appearance; appetite good; sleeps well; sits up all day." Assistant Surgeon H. Allen, U. S. A., contributed the specimen. It is described in the *Catalogue of the Surgical Section*, p. 92, as consisting of "the greater part of the right humerus, shattered at the junction of the upper thirds." The patient was discharged the service and pensioned, June 26, 1863. On July 24, 1865, the patient committed suicide by taking arsenic. His attending physician testifies: "Keyes was a young man in the prime of life, and feeling his future hopes and prospects clouded, he took his loss very much to heart; it continually preyed upon his mind, making him melancholic and disheartened, and while in this condition he took his own life."

FIG. 491.—Shot fracture implicating the neck of humerus. *Spec.* 3144.

CASE 1604.—Private Casper S———, Co. B, 7th New York, aged 30 years, was wounded at Weldon Railroad, August 24, 1864. He was admitted to a Second Corps field hospital. Surgeon W. Vosburg, 111th New York, diagnosticated "Gunshot wound of the arm, slight." Simple dressings were used. The patient was shortly afterward sent to Washington, and entered Lincoln Hospital. Assistant Surgeon W. Lindsley, U. S. A., noted: "Admitted August 28th, with a gunshot wound, causing extensive comminuted fracture of the right humerus. September 1st: Amputation at the shoulder joint, by Assistant Surgeon J. C. McKee, U. S. A. Eight ligatures were used. The anæsthetic employed was a mixture of chloroform and ether. The condition of the soft parts was tolerably good; his constitution not very good." The specimen, represented by the cut (FIG. 491), was contributed by Acting Assistant Surgeon H. M. Dean. It consists of the upper half of the right humerus, shattered in the surgical neck, and amputated at the joint. A portion of the fracture extends to the epiphyseal line, which is not crossed. The patient was discharged the service and pensioned, March 30, 1865. His disability was rated total. He was paid June 4, 1874. This pensioner was provided with an artificial limb by G. R. Grenell & Co., March 22, 1866

TABLE XLVI.

Summary of Eighty-five Cases of Recovery after Intermediary Amputation at the Shoulder for Shot Injury.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Allen, J., Serg't, H, 2d Infantry, age 35.	May 10, 1864.	Shot fracture of left humerus two inches above the condyles; pieces of bone driven into muscles.	May 16, 1864.	Antero-posterior flap amputation at the shoulder joint, by Surg. E. Bentley, U. S. V.	Considerable hæmorrhage. Discharged September 26, 1864; pensioned.
2	Belden, S., Pt., B, 5th Vermont.	June 29, 1862.	Right humerus shattered by a conoidal ball; hæmorrhage.	July 2, 1862.	Amputated at the shoulder, by Surgeon W. P. Russell, 5th Vermont.	Disch'd Sept. 25, 1862; pensioned.
3	Berger, D., Serg't, I, 126th New York, age 26.	May 10, 1864.	Shot fracture of left arm in upper third.	May 14, 1864.	Flap amputation at shoulder joint, by a Confederate surgeon.	Disch'd Feb. 18, 1865; pensioned.
4	Blackman, G. H., Serg't, E, 93d New York, age 23.	May 6, 1864.	Shot wound of right arm, with fracture of humerus.	May 14, 1864.	Flap amputation, by Dr. G. A. Buck.	Disch'd June 29, 1865; pensioned.
5	Bond, G. J., Pt., A, 74th New York, age 21.	July 2, 1863.	Comminuted shot fracture of left humerus.	July 5, 1863.	Amputated at the shoulder, by Ass't Surgeon J. T. Calhoun, U. S. A.	Disch'd July 2, 1864; pensioned.
6	Bone, T., Corp'l, I, 35th Iowa, age 32.	July 14, 1864.	Fracture of neck of right humerus by a conoidal ball.	July 23, 1864.	Amputated at the shoulder, by Surg. J. G. Keenon, U. S. V.	Disch'd Feb. 7, 1865; pensioned.
7	Borchert, W., Pt., E, 4th Pennsylvania Reserves.	Aug. 30, 1862.	Shot wound through left shoulder joint; profuse suppuration; sloughing.	Sept. 9, 1862.	Amputated at shoulder joint by antero-posterior flaps.	Disch'd Dec. 6, 1862; pensioned.
8	Bowers, John L., Pt., C, 2d Wisconsin.	Aug. 30, 1862.	Shot wound of left shoulder, with injury of vessels and of bone.	Sept. 2, 1862.	Amputated at shoulder joint by transfixion.	Disch'd Oct. 10, 1862; pensioned.
9	*Braswell, R. P.*, Pt., G, 15th Alabama, age 25.	Aug. 14, 1864.	Shot fracture of upper third of right arm; soft parts disorganized.	Aug. 19, 1864.	Flap amputation at the shoulder, by Act'g Ass't Surgeon H. B. White.	Sent to Military Prison January 12, 1865.
10	Brewer, D. Z., Pt., D, 115th New York, age 32.	Aug. 16, 1864.	Shot wound of right arm, with severe lesions of bone and soft parts.	Aug. 19, 1864.	Amputated at the shoulder, by a Confederate surgeon.	Disch'd May 18, 1865; pensioned.
11	Bryant, L. J., Pt., C, 3d Wisconsin, age 24.	May 3, 1863.	Comminuted shot fracture of left humerus, involving shoulder joint; sloughing.	May 8, 1863.	Amputated at the shoulder, by Surgeon H. E. Goodman, 28th Pennsylvania.	Disch'd Aug. 8, 1863; pensioned. *Spec.* 1082, A. M. M.
12	Buck, J., Pt., F, 2d Infantry, age 30.	June 27, 1862.	Compound fracture of anatomical neck of right humerus; fracture extended down shaft.	July 20, 1862.	Amputated at the shoulder by the oval method.	Disch'd Feb. 4, 1863; pensioned.
13	Cain, G. W., Pt., H, 140th Pennsylvania, age 19.	May 12, 1864.	Shot wound of right shoulder, with fracture of humerus.	May 20, 1864.	Amputated at the shoulder by Lisfranc's plan.	Disch'd Jan. 18, 1865; pensioned. Died March 17, 1871.
14	Cliggett, J., Pt., H, 99th Pennsylvania, age 20.	July 2, 1863.	Shot fracture of neck of left humerus, extending into the shoulder joint.	July 12, 1863.	Flap amputation, by Surgeon D. S. Hayes, 110th Pennsylvania.	To Vet. Res. Corps Jan. 27, 1864. Discharged June 30, 1864; pensioned. Died Dec. 25, 1871.
15	[1] Cockefair, W., Pt., I, 9th New York Vols.	April 19, 1862.	Shot fracture of head of the left humerus; afterward hæmorrhage.	May 18, 1862.	Amputated at the shoulder by Lisfranc's double flap method, by Dr. A. B. Mott.	Disch'd May 20, 1863; pensioned. Died March 26, 1872.
16	Cole, P., Pt., B, 102d New York.	Sept. 17, 1862.	Shot fracture of upper portion of left humerus, followed by gangrene.	Sept. 20, 1862.	Amputated, by Surgeon B. A. Vanderkieft, U. S. V.	Disch'd Dec. 6, 1862; pensioned. "Wound occasionally breaks open and discharges pieces of bone."
17	Collins, T., Pt., E, 136th Pennsylvania.	Dec. 13, 1862.	Shot comminution of the right humerus near the upper third.	Dec. 25, 1862.	Amputated, by A. A. Surgeon S. L. Loomis.	Disch'd May 9, 1863; pensioned. Died in 1865. *Spec.* 544, A. M. M.
18	*Cook, J. W.*, Pt., D, 11th Mississippi, age 24.	July 2, 1863.	Comminuted fracture of right humerus, high up.	July 6, 1863.	Amputated at the shoulder by double flaps.	Recovered; transferred September 1st, 1863.
19	Cooper, D. D., Pt., I, 37th Illinois, age 27.	April 9, 1865.	Comminuted fracture of left humerus; soft parts infiltrated with serum and blood from venous hæmorrhage.	April 18, 1865.	Amputated, by Surg. A. McMahon, U. S. V.	Disch'd May 24, 1865; pensioned. Wound tender and frequently discharging in 1870.
20	Cronce, A., Pt., G, 15th New Jersey.	June 4, 1864.	Fracture of lower third of left humerus; soft parts lacerated; sloughing.	June 20, 1864.	Amputated, by A. A. Surgeon J. Butterbaugh.	Disch'd May 17, 1865; pensioned. *Spec.* 2637, A. M. M.
21	Decker, L., Pt., H, 76th Pennsylvania.	July 12, 1863.	Gunshot wound of right arm, with injury of nerves, blood-vessels, and bone.	July 16, 1863.	Amputated at shoulder by the double flap method.	To Vet. Res. Corps Jan. 20, 1864. Discharged October 27, 1864; pensioned.
22	Dempsey, J., Pt., D, 51st New York, age 41.	May 6, 1864.	Wound of the right arm near shoulder, with fracture of the humerus.	May 16, 1864.	Amputated at shoulder, by Dr. Comstock, of Harrisburg, Pa.	To Vet. Res. Corps Oct. 28, 1864. Disch'd Sept. 6, 1865; pensioned.
23	Donett, L. H., Serg't, B, 82d New York.	July 21, 1861.	Shot laceration of left arm, with fracture high up.	Aug. 11, 1861.	Amputated, by Surg. S. Logan, P. A. C. S.	Disch'd Nov. 12, 1861; pensioned.
24	Farris, L., Pt., F, 48th Ohio, age 18.	May 22, 1863.	Fracture of upper third of right humerus; arm swollen; abscess in the axilla burrowed beneath pectoral muscles.	June 14, 1863.	Amputated, by Surgeon J. G. Keenon, U. S. V.; diseased surface of glenoid cavity was gouged away.	Mustered out Oct. 17, 1863; pensioned. *Spec.* 1701, A. M. M.
25	Fegeley, M., Pt., K, 151st Pennsylvania.	July 1, 1863.	Wound of left arm, with longitudinal splintering of humerus.	July 9, 1863.	Amputated at the shoulder by Larrey's method.	Mustered out July 30, 1863; pensioned.
26	Flora, F., Pt., F, 7th Pennsylvania Reserves.	June 30, 1862.	Shot injury of right arm, high up, with great inflammatory swelling.	July 3, 1862.	Amputation at the shoulder by antero-posterior flaps.	Disch'd Oct. 4, 1862; pensioned.
27	Flory, J., Corp'l, G, 17th Penn'a Cavalry, age 24.	Mar. 1, 1864.	Fracture of the right humerus, extending into shoulder joint.	Mar. 5, 1864.	Flap amputation, by Surg. H. Johnson, 6th Michigan Cav'ry.	Disch'd July 27, 1865; pensioned.
28	*Fuller, H. F.*, Pt., C, 3d South Carolina, age 24.	July 2, 1863.	Fracture of head and neck of right humerus; ball lodged in glenoid cavity.	July 5, 1863.	Flap amputation at shoulder.	September 16th, healed by first intention; paroled.
29	*Glenn, J. B.*, Serg't, D, 18th Virginia, age 23.	July 3, 1863.	Extensive comminution of upper portion of left humerus; great laceration of soft parts.	July 11, 1863.	Amputated at the shoulder by the oval method.	August 2d, abscess in stump opened; paroled Aug. 22, 1863.
30	Hammons, R. T., Serg't, C, 2d West Virginia Cavalry.	April 1, 1865.	Wound of right shoulder, with lesion of bone and blood-vessels.	April 8, 1865.	Amputated, by Dr. W. D. Reynolds, of Lawrence, Mass.	Disch'd July 1, 1865; pensioned. Stump tender.

[1] The case is reported in detail by Dr. *A. E. M. Purdy*, in *Reports of Hospitals*, in *Am. Med. Times*, 1862, Vol. V, p. 132.

31	Hanson, W. L., Pt., I, 80th New York, age 28.	July 1, 1863.	Fracture of left humerus in the upper third; bleeding and sloughing.	July 7, 1863.	Amputated, by Surg. R. Loughran, 80th New York.	Disch'd Nov. 19, 1863; pensioned.
32	Harlow, J. R., Pt., B, 44th New York, age 21.	July 1, 1862.	Head and five inches of shaft of left humerus comminuted; ball lodged.	July 6, 1862.	Amputated by the Roux method, by Ass't Surg. J. S. Billings, U. S. A.; ball dropped out as the posterior incision was made.	Disch'd Sept. 1, 1862; pensioned. *Spec.* 3450, A. M. M.
33	*Herring, J. M.*, Pt., K, 17th Mississippi, age 32.	June 1, 1864.	Comminuted fracture of head of —— humerus, with gangrenous condition of arm.	June 4, 1864.	Antero-posterior flap amputation.	Furloughed July 20, 1864.
34	Henertz, J. B., Pt., D, 27th Iowa.	April 9, 1864.	Wounds through mouth and left shoulder; inferior left maxilla and head and neck of humerus fractured.	May 9, 1864.	Amputated at the shoulder by external and internal flaps.	Disch'd April 1, 1865, and pensioned. Died Dec. 15, 1871.
35	Hickman, T. N., Pt., E, 18th U. S. Infantry.	Dec. 31, 1862.	Wounded by several balls in right arm and forearm.	Jan. 3, 1863.	Amputated, by Surg. C. S. Muscroft, 10th Ohio.	Disch'd Mar. 11, 1863; pensioned.
36	Hill, A. H., Pt., A, 3d Iowa Cavalry.	May 1, 1863.	One ball entered left elbow, splintering external condyle of the humerus; another ball passed through left shoulder.	May 4, 1863.	Flap operation, by Surgeon I. Castleberry, 1st Indiana Cavalry.	Disch'd July 15, 1863; pensioned. *Spec.* 1349, A. M. M.
37	Hoggatt, J. S., Pt., C, 6th Kansas Cavalry, age 34.	Aug. 3, 1864.	Comp'd comminuted fracture of the left humerus, extending nearly to head; also wounds of jaw and hip.	Aug. 6, 1864.	Antero-posterior flap operation, by Surgeon C. E. Swasey, U. S. V.	Several hæmorrhages; discharg'd November 30, 1864; pensioned. Died November 4, 1866.
38	Howard, J. W., Pt., A, 31st Maine, age 38.	June 16, 1864.	Shot wound of left shoulder, the humerus shattered and soft parts lacerated.	June 20, 1864.	Amputated at the shoulder by the oval method.	Mustered out June 16, 1865; pensioned.
39	Irwin, S., Pt., Hampton's Penn'a Artillery, age 40.	Aug. 29, 1862.	Comminuted fracture of upper half of left humerus, with bleeding and sloughing.	Sept. 11, 1862.	Amputated, by Surg. I. Moses, U. S. V.	Disch'd Nov. 27, 1862; pensioned. Died Dec. 3, 1869. *Spec.* 2952, A. M. M.
40	Jones, C., Pt., D, 2d U. S. Colored Cavalry, age 35.	Mar. 9, 1864.	Shell fracture of upper third of left humerus; profuse suppuration of fœtid pus.	Mar. 25, 1864.	Amputated by oval method, by Asst. Surg. J. H. Frantz, U. S. A.	Mustered out December 5, 1864; pensioned.
41	Jones, D. S., Pt., A, 30th Ohio.	Sept. 13, 1862.	Wound of right arm just below shoulder joint, followed by hæmorrhage.	Sept. 17, 1862.	Amputated at the shoulder by double flaps.	Disch'd Jan. 3, 1863; pensioned.
42	Jones, W. L., Pt., E, 2d Minnesota, age 29.	Sept. 19, 1863.	Right arm badly lacerated by shot.	Sept. 23, 1863.	Amputated, by Surg. O. Ayers, 2d Minnesota.	Mustered out October 10, 1864; pensioned.
43	Kastner, G., Pt., C, 116th Ohio.	June 5, 1864.	Shot wound of left arm, the humerus shattered.	June 27, 1864.	Amputated, by a Confederate surgeon.	Disch'd Mar. 7, 1865; pensioned.
44	Keys, H. F., Pt., E, 12th N. Hampshire, age 21.	May 3, 1863.	Ball shattered eight inches of right humerus.	May 7, 1863.	Antero-posterior flap amputation, by Surg. G. S. Palmer, U. S. V.	Disch'd June 25, 1863; pensioned. *Spec.* 119, A. M. M. Committed suicide July 24, 1865.
45	Kirby, George C., Pt., I, 61st Illinois.	April 6, 1862.	Shot wound of right arm near shoulder.	April 12, 1862.	Amputated at the shoulder by transfixion.	Disch'd Aug. 21, 1862; pensioned.
46	Kremer, P., Serg't, B, 32d Indiana.	Sept. 19, 1863.	Fracture of left humerus by a round ball.	Sept. 23, 1863.	Amputated, by a Confederate surgeon.	Disch'd April 28, 1864; pensioned. Stump occasionally painful.
47	Krome, E., Pt., K, 6th U. S. Infantry.	June 27, 1862.	Shot fracture of right arm near shoulder; consecutive hæmorrhage.	July 5, 1862.	Amputated at the shoulder, by Asst. Surg. C. P. Russell, U. S. A.	Disch'd Mar. 3, 1863; pensioned.
48	Lake, H., Pt., B, 1st New Jersey Cavalry, age 28.	May 5, 1864.	Shot through right humerus three inches below shoulder joint; severe hæmorrhage May 17th.	May 17, 1864.	Antero-posterior flap amputation at shoulder, by Surgeon B. G. Streeter, 4th New York Cavalry.	Disch'd Sept. 22, 1864; pensioned.
49	Lastofka, W., Pt., I, 26th Wisconsin, age 19.	May 2, 1863.	Ball passed through axilla, comminuted the right humerus near the surgical neck; arm painful.	May 15, 1863.	Flap amputation, by Surg. O. A. Judson, U. S. V.	May 22d, secondary hæmorrhage; recurred June 6th; stump opened and axillary artery re-ligated; disch'd Aug. 13, 1863; pensioned. *Specs.* 1213 and 1576, A. M. M.
50	Lyons, M., Sergeant, C, 9th Massachusetts.	July 1, 1862.	Fracture of the left humerus in upper third.	July 6, 1862.	Amputated, by Asst. Surg. H. L. Sheldon, U. S. A.	Disch'd Aug. 22, 1862; pensioned. Died July 17, 1863.
51	Main, H. A., Pt., E, 2d New York Cavalry.	Sept. 23, 1863.	Shot fracture of left humerus at surgical neck.	Sept. 28, 1863.	Flap amputation, by Dr. Black, C. S. A.	Mustered out August 13, 1864; pensioned.
52	McDonald, I. W., Pt., D, 15th Maine, age 29.	April 8, 1864.	Shot fracture of right humerus in upper third.	April 11, 1864.	Amputated at the shoulder by the oval method.	Disch'd May 22, 1864; pensioned.
53	McDonald, S., Pt., I, 16th New York.	Aug. 30, 1862.	Shot wound of left arm	Sept. 9, 1862.	Amputated, by Asst. Surg. Geo. M. McGill, U. S. A.	Disch'd Dec. 16, 1862; pensioned.
54	McKenzie, D., Pt., B, 1st Michigan Cavalry.	Aug. 30, 1862.	Shot wound of left arm	Sept. 2, 1862.	Amputated at the shoulder by Lisfranc's method.	Disch'd Nov. 3, 1862; pensioned.
55	McMahon, F. M., Pt., D, 78th Illinois, age 28.	Sept. 20, 1863.	Comminuted fracture of right arm near shoulder joint.	Sept. 23, 1863.	Amputated by flap method, by Asst. Surg. W. H. Matchett, 40th Ohio.	Disch'd June 10, 1864; pensioned.
56	*Miles, J. H.*, Pt., G, 24th Virginia, age 23.	May 5, 1862.	Ball entered left arm four inches below shoulder joint; humerus extensively split and shattered.	May 26, 1862.	Oval amputation, by Asst. Surg. J. S. Billings, U. S. A.; five ligatures.	Discharged September 15, 1862. *Spec.* 1091, A. M. M.
57	[1]Myers, J. C., Pt., D, 61st Pennsylvania, age 21.	June 1, 1862.	Fracture of head of right humerus; head excised June 1st, by Surgeon R. M. Tindle.	June 17, 1862.	Amputated, by Dr. Willard Parker.	Oct. 10, 1862, ball and several pieces of bone removed. Disch'd Dec. 3, 1862; pensioned.
58	Nesbitt, W. M., Corporal, D, 4th Vermont, age 31.	May 12, 1864.	Shot fracture of left humerus near shoulder joint.	May 16, 1864.	Amputated at the shoulder....	Disch'd July 29, 1865; pensioned.
59	Nichols, C., Pt., B, 121st New York.	May 3, 1863.	Comminuted shot fracture of left humerus.	May 6, 1863.	Amputated, by Ass't Surgeon D. M. Holt, 121st New York.	Disch'd Aug. 27, 1863; pensioned.
60	Richards, F. D., Pt., C, 35th Massachusetts, age 38.	Sept. 17, 1862.	Left humerus comminuted by a large projectile.	Sept. 27, 1862.	Amputated, by Asst. Surg. Geo. M. McGill, U. S. A.	Disch'd Mar. 4, 1865; pensioned.
61	Ripley, W. H., Pt., K, 76th New York.	Aug. 29, 1862.	Wound of left arm by ball and buckshot, followed by sloughing.	Sept. 7, 1862.	Amputated, by Acting Asst. Surg. W. B. Crane.	Disch'd Dec. 13, 1862; pensioned.
62	Robins, W. B., Pt., H, 5th New York Heavy Artillery, age 28.	Aug. 26, 1864.	Extensive shot comminution of right shoulder; wound gangrenous.	Aug. 29, 1864.	Amputated by double flap method, by Act'g Ass't Surg. J. R. Uhler.	To Veteran Reserve Corps March 2, 1865; pensioned.
63	Rœhm, C., Corp'l, F, 29th New York, age 24.	May 3, 1863.	Shot fracture of upper third of right humerus.	May 7, 1863.	Amputated, by Surgeon R. Thomain, 29th New York.	Mustered out June 22, 1863; pensioned. *Spec.* 1540, A. M. M.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
64	Roth, L., Pt., E, 12th Pennsylvania Reserves.	Sept. 14, 1862.	Shot comminution of upper portion of right humerus; profuse suppuration.	Oct. 2, 1862.	Flap amputation, by Surg. H. S. Hewitt, U. S. V.	Disch'd Dec. 15, 1862; pensioned. *Spec.* 441, A. M. M.
65	Schmidt, C., Pt., B, 7th New York Heavy Artillery, age 30.	Aug. 25, 1864.	Upper portion of right humerus shattered by large large shot.	Sept. 1, 1864.	Amputated, by Asst. Surg. J. C. McKee, U. S. A.; eight ligatures.	Disch'd Mar. 30, 1865; pensioned. *Spec.* 3144, A. M. M.
66	Sewall, N. A., Pt., B, 100th Pennsylvania, age 25.	June 2, 1864.	Ball passed along the whole length of right arm, comminuted upper two thirds of humerus, and opened the elbow joint.	June 11, 1864.	Antero-posterior flap operation, by Asst. Surg. A. Ingram, U. S. A.; lower part of flaps left open and dry.	Mustered out August 31, 1864; pensioned. *Spec.* 2822, A. M. M. See left figure in PLATE XLVI. opposite p. 640.
67	Shaw, J. B., Pt., D, 65th Ohio.	Sept. 19, 1863.	Shot comminuted fracture of upper third of right humerus.	Sept. 22, 1863.	Amputated, by Surgeon A. McMahon, 64th Ohio.	Hæmorrhage Oct. 1st; Nov. 1st, stump healed. Disch'd April 16, 1864; pensioned.
68	[1] Shepler, J., Pt., B, 108th New York, age 24.	June 3, 1864.	Comminuted fracture of right humerus; June 13, 1864, head and four inches of the shaft excised.	July 13, 1864.	Amputated by Larrey's method, by Asst. Surg. J. C. McKee, U. S. A.; ten ligatures.	Disch'd Feb. 6, 1865; pensioned. *Spec.* 550, A. M. M.
69	Showman, E. W., Pt., D, 113th Ohio, age 25.	Oct. 7, 1863.	Fracture of inferior costa of left scapula and neck of the left humerus.	Oct. 14, 1863.	Amputated by long lateral flap method, by Surgeon G. W. Hogeboom, U. S. V.	Gangrene. Discharged April 6, 1864; pensioned.
70	Sinex, C., Pt., A, 26th Pennsylvania, age 40.	July 2, 1863.	Fracture of upper third of the right humerus.	July 5, 1863.	Amputated, by Surg. C. C. Jewett, 16th Massachusetts.	Variola. Discharged August 24, 1864; pensioned.
71	Smith, J. A., Pt., A, 16th Wisconsin.	April 6, 1862.	Shot fracture of left humerus near shoulder.	April 9, 1862.	Amputated at the shoulder by double flaps.	Disch'd June 18, 1862; pensioned.
72	Spamont, C. B. A., Corp'l, G, 5th Ohio, age 27.	May 3, 1863.	Shot fracture of left humerus.	May 6, 1863.	Amputated, by Surg. W. M. Nash, P. A. C. S.	Disch'd Aug. 21, 1863; pensioned.
73	Stewart, A. B., Pt., D, 121st Pennsylvania, age 23.	July 1, 1863.	Wound of left arm, involving bone and vessels, high up.	July 9, 1863.	Flap amputation at shoulder joint.	Large abscess between flaps; solution of the sulphate of zinc. Disch'd May 24, 1864; pensioned.
74	Striker, Philip, Pt., F, 31st New York.	June 27, 1862.	Wound of the right arm, with lesions of the bone and of the artery.	July 5, 1862.	Amputated at the shoulder by Larrey's method.	Disch'd June 3, 1863; pensioned. Died November 6, 1871.
75	Taylor, J. J., Pt., K, 21st New York Cavalry, age 29.	May 22, 1864.	Shot fracture of right arm in upper third; wound gangrenous.	May 31, 1864.	Vertical flap amputation, by Surg. J. Hoone, 1st Bat. Home Brigade.	June 8th, secondary hæmorrhage. Disch'd Oct. 25, 1864; pensioned. *Spec.* 3385, A. M. M.
76	Vollman, John, Pt., G, 1st Ohio.	June 17, 1861.	Shot wound of right arm, the humerus shattered in upper third.	July 3, 1861.	Amputated at the shoulder by oval incisions.	Disch'd Sept. 16, 1861; pensioned.
77	Wade, S., Pt., A, 77th Pennsylvania, age 19.	Mar. 2, 1863.	Extensive fracture of upper portion of right humerus; March 30th, violent hæmorrhage.	Mar. 30, 1863.	Poupart's flap amputation, by Surg. B. A. Vanderkeift, U. S. A.	Mustered out October 10, 1864; not a pensioner. *Spec.* 1044, A. M. M.
78	*Welahan, M.*, Pt., C, 25th Virginia, age 21.	July 2, 1863.	Fracture of upper third of left humerus; profuse suppuration and sloughing.	July 6, 1863.	Exarticulation at shoulder by oval incisions.	Paroled November 12, 1863.
79	Welch, J., Pt., B, 6th Infantry, age 26.	Mar. 18, 1865.	Comminution of upper part of left humerus; axillary artery, vein, and nerves severed; March 20, 1865, five inches of shaft excised, by Asst. Surg. J. E. Semple, U. S. A.	Mar. 21, 1865.	Amputated at the shoulder by the same operator.	Disch'd July 3, 1865; pensioned.
80	Wendel, A., Corp'l, A., 22d Indiana.	Dec. 31, 1862.	Shot wound of left arm, with fracture and sloughing.	Jan. 12, 1863.	Amputated at the shoulder by Larrey's first method.	Disch'd April 27, 1863; pensioned.
81	*White, J. M.*, Pt., Carter's Battery, age 28.	Sept. 14, 1863.	Fracture of left arm and shell wound of thigh.	Sept. 21, 1863.	Amputated, by Surg. Robertson, Carter's Battery, C. S. A.	Furloughed December 12, 1863.
82	Willett, H. B., Pt., E, 29th Wisconsin.	April 8, 1864.	Fracture of head and upper third of the right humerus; wound gangrenous.	April 18, 1864.	Antero-posterior flap operation, by Surg. F. Bacon, U. S. A.	Disch'd June 20, 1864; pensioned.
83	Winchell, J., Pt., D, 1st U. S. Sharpshooters.	June 27, 1862.	Wound of left arm, with injury of bone, nerves, and vessels.	July 1, 1862.	Amputated at the shoulder by external and internal flaps.	Disch'd Sept. 18, 1862; pensioned.
84	Zane, G. B., Serg't, A, 72d Pennsylvania, age 23.	Dec. 13, 1862.	Shell wound of left shoulder joint, shattering bone and injuring vessels.	Dec. 16, 1862.	Circular amputation, by Surg. M. Rizer, 72d Pennsylvania.	Disch'd May 2, 1864; pensioned.
85	Zluhorn, J., Pt., K, 93d Pennsylvania.	May 31, 1862.	Fracture of the left arm near shoulder.	June 21, 1862.	Amputated, by Acting Asst. Surg. W. K. Cleveland.	Disch'd Sept. 18, 1862; pensioned.

In these eighty-five amputations, the side implicated was specified in every case save one; the right limb was removed in forty, and the left in forty-four. Seventy-four patients were discharged, four went to modified duty in the second battalion of the Veteran Reserves, and seven were exchanged, furloughed, or paroled. Disarticulation was most frequently practised by making a large deltoid flap by transfixion, exarticulating, and then cutting a short internal flap; but the oval method was also frequently employed, and all the varieties of double flap procedures. The proportion of operations for wounds by large missiles was much less than among the primary operations. In many cases gangrene or hæmorrhage rendered operative interference imperative. Six of the patients had severe wounds coincident with those at the shoulder. One underwent consecutive ligation of the axillary artery; this was the patient who had previously submitted to excision at the shoulder. Two were cases in which four or five inches of the shaft of the humerus had been previously removed.

PLATE XLVI. SHOT COMMINUTIONS OF THE HUMERUS.

Nos. 2822 and 1234. SURGICAL SECTION.

§ *Unsuccessful Operations.*—The proportion of fatality in the intermediary amputations at the shoulder after shot injury was nearly twice as great as in the primary series. In seventeen instances, the disarticulations were subsequent to important primary or early intermediary operations. Thus, in eleven cases, the head or portions of the shaft of the humerus had been excised; prior amputations in the continuity had been practised in two of the cases; balls and fragments of bone had been extracted and arterial branches tied, in four cases. The three following examples illustrate fatal exarticulations at the shoulder at different periods of the intermediary stage:

CASE 1605.—Private P. P———, Co. E, 17th Wisconsin, aged 43 years, was wounded at Vicksburg, May 19, 1864. He was sent to Memphis on the hospital steamer R. C. Wood, and entered Gayoso Hospital June 1st. The pathological specimen represented (FIG. 492) was forwarded by the operator, Assistant Surgeon W. Watson, U. S. V., with the following history: "Wounded by a conoidal ball, which fractured the left humerus at the surgical neck. When admitted the arm was swollen and livid; the general appearance of the patient was anæmic and unpromising, but amputation was decided upon as affording the only chance of saving life. The arm was amputated at the shoulder joint June 3d. The patient gradually sank, and died June 7, 1864. The treatment consisted of concentrated nourishment and stimulants, freely given." The specimen is thus described in the Catalogue of 1866, p. 114, by Assistant Surgeon A. A. Woodhull, U. S. A.: "The upper third of the left humerus amputated at the shoulder joint. The specimen shows a nearly transverse fracture of the surgical neck and a longitudinal fracture of the shaft for three inches, inflicted by a conoidal ball. Incipient caries is seen along the line of fracture."

FIG. 492.—Upper third of humerus exarticulated at the left shoulder. *Spec.* 2082.

FIG. 493.—Conoidal ball impacted in the head of the right humerus. *Spec.* 2564.

CASE 1606.—Private John B———, Co. C, 7th New York Heavy Artillery, aged 27 years, was wounded at Cold Harbor, June 3, 1864, and treated in a Second Corps field hospital. He was thence transferred to Washington, and admitted to Emory Hospital on June 8th. Surgeon N. R. Moseley, U. S. V., noted: "Gunshot wound of the right arm, the ball entering at the insertion of the deltoid, passing upward, and lodging in the shoulder joint. On June 16th, amputation at the shoulder was performed by antero-posterior flaps. At this time the wound was ecchymosed and œdematous, and the bones comminuted; constitutional condition unfavorable, with nervous prostration. The treatment consisted of stimulants internally, and local pressure on the femoral arteries to retain blood in the trunk. The patient continued to sink, and died of collapse six hours after the operation. The specimen (FIG. 493) consists of the upper fourth of the right humerus, disarticulated for fracture of the head by a conoidal ball, which destroyed the greater tuberosity and lodged. Several partial fractures extend through the head and neck." Contributed by the operator, Surgeon N. R. Moseley, U. S. V.

CASE 1607.—Corporal E. K———, of the Band of the De Kalb Regiment (41st New York), was accidentally shot, by a comrade who was inspecting a pistol, July 23, 1861. He was conveyed to the E Street Infirmary, Washington. Surgeon J. W. S. Gouley, U. S. A., operated, and contributed the specimen, represented by the cuts (FIGS. 494-5), with the following history: "Corporal K——— was sitting on his bed and leaning slightly forward, and his friend was sitting on the floor two feet in front of him, cleaning a pistol, which was accidentally discharged, the ball taking effect in his left shoulder. He was conveyed to the E Street Infirmary the day of the accident. The wound was carefully examined, and the ball found lodged in the head of the os brachii. Resection was proposed, but objected to by the surgeon in charge. Some days subsequent to the injury, and after due consultation with Surgeon R. Murray, Assistant Surgeons W. J. H. White, J. J. Milhau, U. S. A., and Acting Assistant Surgeon Butler, it was decided by the majority to amputate at the shoulder joint. With the assistance of these gentlemen the operation was performed. The patient sustained much loss of blood during the operation, and died a day and a half afterward, July 28, 1861. It is proper to state that prior to the operation the patient had exhibited symptoms of pyæmia. The specimen shows a conical ball embedded in the cancellated tissue of the bone, with two fissures, and also that it was a most favorable case for primary resection, for when he entered the hospital his condition was excellent." The discussions to which this case gave rise are believed to have promoted the favorable consideration of the views of the advocates of excision in injuries of this character.

FIG. 494.—Pistol ball perforation of the head of the left humerus, which was exarticulated intermediarily. *Spec.* 347. ½.

FIG. 495.—Posterior view of the same specimen, showing the apex of the ball, which has traversed the head of the humerus.

A tabular statement, including the above and sixty-nine other unsuccessful intermediary exarticulations at the shoulder, commences on the next page.

TABLE XLVII.

Summary of Seventy-two Fatal Cases of Intermediary Amputation at the Shoulder for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Allen, F. A., Corp'l, G, 20th Massachusetts.	Sept. 17, 1862.	Shot fracture of the right arm; Sept. 17th, arm amputated at middle third; sloughing.	Oct. 12, 1862.	Re-amputated at the shoulder, by A. A. Surg. L. Fisher.	Pyæmia; death October 25, 1862. *Spec.* 267, A. M. M.
2	Andrews, C. N., Adjutant, 85th Illinois.	June 27, 1864.	Shot fracture of middle third of left humerus; June 27th, amputated at the junction of upper and middle thirds, by Surg. M. M. Hooton, 86th Illinois; gangrene.	July 19, 1864.	Re-amputated at the shoulder, by A. A. Surg. J. A. Hall.	Died July 23, 1864, from gangrene.
3	Bartley, J., Pt., C, 7th New York, age 27.	June 3, 1864.	Ball lodged in right shoulder joint; great nervous prostration.	June 16, 1864.	Antero-posterior flap exarticulation, by Surg. N.R.Moseley.	Died, six hours after operation, June 16, 1864. *Spec.* 2564, A. M. M.
4	Beckwith, G., Pt., E, 58th Pennsylvania, age 18.	June 30, 1864.	Shot fracture of right shoulder joint; necrosis; tissues lacerated.	July 26, 1864.	Amputation at the shoulder, by Ass't Surg. E. Curtis, U. S. A.	Died July 31, 1864.
5	Bell, I., Pt., B, 60th Ohio, age 19.	May 9, 1864.	Ball entered between left clavicle and trapezius, shattering scapula, and lodged. Hæmorrhages May 27th, 28th, 30th, and 31st.	May 31, 1864.	Amputation at the shoulder, by A. A. Surg. C. H. Osborne.	Died May 31, 1864; the autopsy showed extensive stellated fracture of scapula and division of enprascapula artery.
6	*Bennett*, —, Pt., Louisiana Regiment.	April 6, 1862.	Shot fracture of humerus, with laceration of soft parts.	April 16, 1862.	Amputated at the shoulder, by Ass't Surg. B. Howard, U.S.A.	Died April 17, 1862.
7	*Bissell, W. R.*, Capt., A, 8th Virginia.	J'ly 1–3, 1863.	Shot fracture of head of humerus; fissures extending nearly whole length of shaft.	A few days after inj'y.	Amputated, by Surgeon C. S. Wood, 66th New York.	Died July 16, 1863.
8	Boone, W., Pt., G, 55th Pennsylvania.	Oct. 22, 1862.	Comminution of upper third of left humerus; Oct. 23d, fragments of bone removed.	Nov. 12, 1862.	Circular amputation, by A. A. Surg. T. T. Smiley.	No reaction; died November 12, 1862. *Spec.* 689, A. M. M.
9	Crompton, J. T., Serg't, I, 14th New Jersey, age 25.	July 9, 1864.	Comminuted fracture of right humerus; arm œdematous; pus burrowing.	July 22, 1864.	Amputated, by Ass't Surgeon R. F. Weir, U. S. A.	Died from shock, eight hours after operation, July 22, 1864.
10	Donaldson, T., Pt., E, 13th Ohio Cavalry, age 22.	Oct. 8, 1864.	Upper third of left humerus; bone necrosed for seven inches and head of bone completely destroyed; tissues disorganized.	Oct. 29, 1864.	Antero-posterior flap operation, by A. A. Surg. J. C. Morton.	Died Oct. 29, 1864, from effects of chloroform and shock. *Spec.* 3706, A. M. M.
11	Durif, E., Corp'l, B, 131st New York, age 37.	Sept. 19, 1864.	Head of left humerus comminuted; parts infiltrated with pus.	Sept. 27, 1864.	Flap amputation, by A. A. Surgeon J. R. Uhler.	Died October 4, 1864.
12	Elderkin, N., Pt., G, 18th Wisconsin.	May 22, 1863.	Compound fracture of upper third of left humerus.	June 1, 1863.	Amputated at the shoulder....	Died June 5, 1863, from effect of excessive hæmorrhage during operation.
13	[1]Fee, J. A., Capt., I, 48th New York, age 27.	June 28, 1864.	Wound of right shoulder; June 28th, excision of head of right humerus; profuse suppuration; secondary hæmorrhage.	July 13, 1864.	Amputation at the shoulder, by Surg. D. G. Rush, 101st Pennsylvania.	Died July 15, 1864.
14	Felton, C., Serg't, K, 122d New York, age 39.	June 3, 1864.	Wound of face and right arm; ball entered right shoulder, fractured humerus 1½ inches below head down to within 3 inches of elbow joint.	June 18, 1864.	Amputated, by A. A. Surgeon H. M. Dean.	Died June 23, 1864. *Spec.* 2573, A. M. M.
15	Ferree, J., Pt., I, 93d Indiana, age 20.	Sept. 11, 1864.	Wound through chest and right arm; humerus shattered at upper third.	Sept. 16, 1864.	Amputated, by A. A. Surgeon J. Brey.	Died Sept. 18, 1864. Autopsy showed fifth, sixth, and seventh ribs fractured, and fragments of bone driven into lung and liver.
16	Gallon, C., Corp'l, F, 96th Pennsylvania.	Nov. 7, 1863.	Shell fracture of right humerus to the anatomical neck; parts ecchymosed.	Nov. 12, 1863.	Amputated, by A. A. Surgeon W. M. Hudson.	Died November 20, 1863.
17	Gillies, P., Pt., H, 131st New York, age 25.	Oct. 19, 1864.	Comminution of head of left humerus; hæmorrhage from axillary amounting to twenty ounces.	Oct. 26, 1864.	Amputated, by Ass't Surgeon D. C. Peters, U. S. A.	Oct. 31st, hæmorrhage amounting to 32 ounces; axillary ligated on face of stump; hæmorrhage recurred; death Nov. 1, 1864.
18	Goudy, W., Pt., H, 26th Ohio.	Sept. 19, 1863.	Fracture of right radius and ulna; mortification extending high up in arm.	Sept. 25, 1863.	Amputation at the shoulder by double flaps.	Died.
19	[2]Green, N. S., Pt., A, 55th Massachusetts.	May 6, 1864.	Wound of left shoulder joint; excision of head of humerus; hæmorrhage.	June 5, 1864.	Amputated, by Surgeon R. B. Bontecou, U. S. V.	Died June 7, 1864.
20	Hall, C., Serg't, F, 25th Massachusetts, age 28.	June 3, 1864.	Ball entered upper left arm, passed along the humerus, and lodged in elbow joint; gangrenous to near shoulder joint.	June 14, 1864.	Amputated, by Surgeon D. P. Smith, U. S. V.	Died June 14, 1864, from exhaustion.
21	[3]*Harrill, J. W.*, Serg't, B, 26th Alabama, age 25.	July 3, 1863.	Wound of right humerus; head excised, by Surgeon H. E. Goodman, 28th Pennsylvania.	July 12, 1863.	Amputation at the shoulder by the oval method.	July 19th, hæmorrhage from axillary; death July 21, 1863.
22	Harrison, G., Pt., G, 61st New York, age 23.	May 8, 1864.	Shot through right elbow; intense inflammation extending to the shoulder; pus diffused through arm.	May 19, 1864.	Amputated, by Surg. E. Bentley, U. S. V.	May 25th, symptoms of pyæmia; died June 4, 1864.
23	Hart, J., Pt., C, 59th New York, age 26.	June 22, 1864.	Fracture of the left scapula and shoulder joint.	June 29, 1864.	Double flap amputation, by A. A. Surg. T. F. Belton.	See'd'y hæmorrhage; transfusion of blood thro' incision on back of scapula; death July 7, 1864.
24	Hayes, J., Serg't, K, 7th Ohio.	April 2, 1862.	Comminuted fracture of humerus; much laceration.	April 18, 1862.	Amputated, by Ass't Surgeon B. Howard, U. S. A.	Died April 19, 1862.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
25	Herrick, M., Pt., D, 49th New York, age 21.	May 5, 1864.	Fracture of left humerus; same day three inches of shaft excised; secondary hæmorrhage May 25th; a large sac discovered over scapula containing about thirty ounces of blood.	May 26, 1864	Amputated at the shoulder, by Ass't Surgeon W. Thomson, U. S. A.	Died one-half hour after the operation, May 26, 1875. *Spec.* 3595, A. M. M.
26	*Higgins, C.*, C, 41st Mississippi.	Sept. 20, 1863.	Right arm shattered; hæmorrhage from sloughing of the brachial artery.	Sept. 28, 1863.	Amputation at the shoulder joint by lateral and internal flaps.	Died October 6, 1863, of pyæmia.
27	Hoffmann, W. H., Pt., C, 5th New Hampshire.	May 31, 1862.	Wound at upper third of left arm; secondary hæmorrhage.	June 10, 1862.	Amputated, by A. A. Surgeon J. Neill.	Died June 24, 1862, from secondary hæmorrhage.
28	Hoggard, J., Corp'l, E, 137th Illinois, age 20.	Aug. 21, 1864.	Shot fracture of upper third of right humerus; about one-half inch of each of the fractured ends was removed with the saw; hæmorrhage from the brachial artery; September 9th, hæmorrhage recurred.	Sept. 9, 1864.	Amputated, by A. A. Surgeon J. Brey. Sept. 11th, hæmorrhage from axillary artery to the amount of one pint and a half. Stump opened and artery again ligated at the same point.	Died Sept. 12, 1864, from effects of another hæmorrhage from axillary artery.
29	Holmes, D., Pt., I, 140th Illinois, age 35.	July 9, 1864.	Shot fracture of middle third of right humerus; parts gangrenous; hæmorrhage from the brachial artery, necessitating amputation.	July 17, 1864.	Amputated by Lisfranc's method, by A. A. Surgeon S. S. Jessup.	Died July 29, 1864.
30	Horniday, D. B., Pt., C, 18th Indiana.	Oct. 19, 1864.	Shot wound of left arm; comminuted fracture of humerus, extending to joint; gangrene.	Oct. 23, 1864.	Amputated, by Ass't Surgeon B. Fordyce, 160th New York.	Died October 24, 1864, from exhaustion.
31	Irwin, D., Pt., K, 36th Ohio, age 23.	July 24, 1864.	Shot fracture of right humerus; August 7th, 8th, 9th, and 10th, hæmorrhages from posterior circumflex; arrested by compression on subclavian.	Aug. 10, 1864.	Amputated, by Surgeon J. B. Lewis, U. S. V.	Died Aug. 10, 1864, from effects of hæmorrhage and tetanus. *Spec.* 4263, A. M. M.
32	Kelsey, G., Pt., I, 4th New York Artillery, age 28.	June 18, 1864.	Severe shot wound of right arm; June 18, 1864, excision.	July 3, 1864.	Amputation at the shoulder joint by Lisfranc's method.	Died July 7, 1864, of pyæmia.
33	Kleinschmidt, E., Corp'l, 41st New York.	July —, 1861.	Small conoidal ball perforated the head of the left humerus, exposing its point in the anatomical neck opposite; symptoms of pyæmia.	July 26, 1861.	Amputated, by Ass't Surgeon J. W. S. Gouley, U. S. A.	Much loss of blood during the operation. Pyæmia supervened. Died July 28, 1861. *Spec.* 347, A. M. M.
34	Kuhlman, J., Pt., I, 121st Ohio, age 23.	June 27, 1864.	Shot fracture of right humerus; gangrene.	July 15, 1864.	Amputated, by A. A. Surgeon J. A. Hall.	Died July 18, 1864, of pyæmia.
35	Kuntz, J., Pt., D, 9th Wisconsin.	Sept. 29, 1862.	Shot wound of shoulder.....	Oct. 4, 1862.	Amputation at shoulder joint by double flaps.	Died October 25, 1862, of pyæmia.
36	Lawson, G., Pt., A, 86th New York, age 35.	May 7, 1864.	Shot comminution of the upper third of left humerus; May —, 1864, excision of head and portion of shaft; hæmorrhage from axillary artery.	May 23, 1864.	Amputated at shoulder joint, by Surgeon R. B. Bontecou, U. S. V.	Died May 31, 1864.
37	Marqwart, J., Pt., A, 17th Pennsylvania Cavalry, age 24.	June 21, 1864.	Shot wound of right forearm; June 25th, missile extracted; gangrene.	June 26, 1864.	Antero-posterior flap amputation at the shoulder joint, by Surg. O. A. Judson, U. S. V.	Died June 26, 1864, from effects of gangrene.
38	Mason, A. B., Corp'l, A, 4th Pennsylvania Reserves.	June 30, 1862.	Ball traversed surgical neck of left humerus, comminuting and splintering the bone into the shoulder joint; parts sloughing.	July 21, 1862.	Amputated by transfixion, by Surg. J. H. Brinton, U. S. V.	Died July 25, 1862. *Spec.* 571, A. M. M.
39	McCarthy, P., Pt., F, 57th Massachusetts, age 27.	June 17, 1864.	Shot wound through the right shoulder; upper portion of humerus fractured and axillary artery injured.	July 1, 1864.	Amputated, by A. A. Surgeon C. Everard.	July 2d, gangrene; died July 5, 1864, from exhaustion.
40	McColligan, M., Pt., C, 56th Massachusetts, age 18.	May 18, 1864.	Fracture of upper third of left humerus; gangrene; June 6th, symptoms of pyæmia; June 8th, hæmorrhage from brachial close to axilla; arrested by compression upon subclavian.	June 8, 1864.	Amputated, by Surgeon D. P. Smith, U. S. V.	Diarrhœa; died July 5, 1864, of pyæmia. *Specs.* 2917 and 3209, A. M. M.
41	*McGough, J. H.*, Pt., I, 45th Georgia, age 23.	May 3, 1863.	Comminuted fracture of upper third of humerus; ball passing into thorax and lodging.	May 23, 1863.	Amputated at shoulder joint by oval incisions.	May 25th, severe chill. May 29, hæmorrhage; flaps opened and artery secured; died June 3, 1863.
42	McTeague, T., Pt., I, 86th New York, age 20.	May 14, 1864.	Shot wound of left arm; humerus comminuted about four inches from middle; pus burrowed around shoulder joint; symptoms of pyæmia.	June 5, 1864.	Flap amputation just above insertion of deltoid, and head of bone removed afterward, by Assistant Surgeon A. Ingram, U. S. A.	Died June 17, 1864, of pyæmia and shock. *Spec.* 2823, A. M. M.
43	Meeder, J., Pt., I, 1st Maine Heavy Artillery, age 25.	June 12, 1864.	Fracture of the right shoulder, opening joint and carrying away head of humerus.	June 20, 1864.	Amputated, by Ass't Surgeon J. S. Smith, U. S. A.	Gangrene; died July 1, 1864. *Spec.* 3078, A. M. M.
44	Moll, W., Pt., A, 14th U. S. Infantry.	Aug. 30, 1862.	Fracture of shaft of left humerus extending into upper third.	Sept. 15, 1862.	Amputated, by Surgeon T. E. Mitchell, 1st Maryland.	Died Sept. 26, 1862. *Spec.* 829, A. M. M.
45	Morris, F. M., Pt., G, 18th Kentucky.	Sept. 19, 1863.	Fracture two inches above right elbow joint; gangrene.	Oct. 16, 1863.	Amputated, by Surgeon A. McMahon, 64th Ohio.	Died October 23, 1863.
46	Mowrey, H. B., Corp'l, B, 6th Pennsylvania Reserves, age 26.	Sept. 17, 1862.	Fracture of left humerus, ball lodging; Sept. 23d, ball extracted; Sept. 26th, hæmorrhage, caused by sloughing of brachial; gangrene.	Sept. 27, 1862.	Subclavian ligated in its third portion, and amputation performed, by Surg. A. B. Hasson, U. S. A.	Died Sept. 27, 1862, a few hours after the operation.
47	Mullen, B., Pt., D, 28th Massachusetts.	Aug. 30, 1862.	Fracture of left arm at middle third, ball lodging in axilla; remained on field for eight days.	Sept. 9, 1862.	Flap amputation, by A. Ass't Surgeon G. McCoy.	A large ecchymosed spot on sacrum and another over right scapula; both sloughing and discharging pus; died suddenly, Oct. 31, 1862, the wound entirely healed. *Spec.* 1226, A. M. M.
48	O'Dell, H., Pt., A, 1st Pennsylvania Rifles, age 36.	June 24, 1864.	Fracture of upper third of right humerus by a large projectile.	July 9, 1864.	Flap amputation, by A. A. Surgeon J. M. Flood.	Died July 9, 1864, from exhaustion, caused by hæmorrhage and operation.

[1] See Case 41, Table XXXII. p. 571 *ante*.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
49	Ourish, P., Serg't, E, 32d Massachusetts, age 19.	May 30, 1864.	Fracture of left humerus at upper third; May 31st, excision to within two inches of the head, and axillary artery ligated close below clavicle; June 7th, hæmorrhage from axillary; two inches of the clavicle removed from over the artery and the vessel again ligated, by Asst. Surg. G. A. Mursick, U. S. V.; gangrene.	June 8, 1864.	Amputated by the double flap plan, by Ass't Surgeon G. A. Mursick, U. S. V.	Died June 8, 1864, from shock.
50	Paddock, B., Pt., E, 17th Wisconsin, age 43.	May 19, 1863.	Fracture of left humerus at surgical neck; diffuse suppuration, with sloughing.	June 3, 1863.	Amputated, by Ass't Surgeon W. Waters, U. S. V.	Died June 27, 1863, from exhaustion. *Spec.* 2082, A. M. M.
51	Peterson, P., Pt., 2d Battalion Missouri State Militia.	Aug. 11, 1862.	Shot wound of arm; ball struck styloid process of the radius, passed upward, carrying away olecranon process of ulna, and was cut out near insertion of deltoid; Sept. 1st, gangrene.	Sept. 2, 1862.	Amputated at shoulder joint by Larrey's first method.	Died September 4, 1862.
52	[1]Regan, C., Pt., G, 37th New York.	May 5, 1862.	Fracture of head of left humerus and scapula.	May 31, 1862.	Amputated, by Surgeon A. B. Mott, U. S. V.	Died June 1, 1862, from hæmorrhage.
53	Rosa, J., Pt., K, 71st Ohio, age 30.	Dec. 16, 1864.	Fracture of upper third of left humerus; gangrene.	Dec. 31, 1864.	Amputated, by A. A. Surgeon M. N. Benjamin.	Died Feb. 5, 1865, of pyæmia.
54	Runkle, J. G., Corp'l, A, 15th New Jersey, age 19.	May 12, 1864.	Two shot wounds of left arm; one ball passed thro' shoulder, fracturing head and two inches of shaft of humerus, the other passed through forearm, splintering ulna at middle third.	June 1, 1864.	Amputated, by Surgeon D. W. Bliss, U. S. V.	Died June 7, 1864. *Spec.* 2395, A. M. M.
55	Saukey, M. A., Pt., I, 103d Pennsylvania, age 18.	Dec. 14, 1862.	Fracture of right humerus; Dec. 27th, excision of three and a half inches of middle third of humerus, by Surg. C. A. Cowgill, U. S. V.; January 8, 1863, hæmorrhage from brachial.	Jan. 8, 1863.	Amputated at shoulder joint, by Surgeon C. A. Cowgill, U. S. V.	Died, Jan. 8, 1863, from exhaustion. *Spec.* 1327, A. M. M.
56	*Scroggs, J. J.*, Pt., D, 16th North Carolina, age 20.	July 3, 1863.	Fracture of left humerus, high up, with sloughing.	July 7, 1863.	Amputated at shoulder joint by the oval method.	Died July 22, 1863, of tetanus.
57	Smith, D., Pt., F, 13th New Hampshire, age 48.	June 2, 1864.	Fracture of the right humerus; comminution of the head and nearly the whole of the shaft; pus diffused through the muscular tissues.	June 13, 1864.	Amputated, by Surg. E. Bentley, U. S. V.	Died June 17, 1864, from exhaustion.
58	Smith, S. R., Pt., G, 207th Pennsylvania, age 34.	April 2, 1865.	Fracture of entire upper third of right humerus.	April 5, 1865.	Amputated, by Ass't Surg. W. Carroll, U. S. V.	Died April 7, 1865, from secondary hæmorrhage. *Spec.* 4162, A. M. M.
59	Smith, W., Pt., E, 40th Indiana, age 39.	Nov. 26, 1864.	Shot wound of left arm; erysipelas; gangrene.	Dec. 11, 1864.	Amputated, by A. A. Surgeon J. H. McIntyre.	Died, Dec. 16, 1864, from exhaustion.
60	Spencer, J. A., Pt., K, 1st Maine.	Mar. 25, 1865.	Fracture of left humerus at upper third by two balls, one of which lodged; April 15th, hæmorrhage from brachial.	April 15, 1865.	Amputated, by Surgeon D. W. Bliss, U. S. V.	Died April 23, 1865. *Spec.* 4081, A. M. M.
61	Spies, M. S., Pt., K, 26th New York.	Sept. 17, 1862.	Fracture of right elbow joint; erysipelas; gangrene.	Oct. 3, 1862.	Amputated, by Ass't Surgeon R. F. Weir, U. S. A.	Died Oct. 12, 1862. *Spec.* 773, A. M. M.
62	Stengele, J., 1st Serg't, E, 14th U. S. Infantry, age 26.	June 18, 1864.	Fracture of upper third of left humerus, with injury to principal artery.	June 30, 1864.	Amputated, by Ass't Surgeon C. A. Hamilton, 76th N. York.	Died July 5, 1864, from secondary hæmorrhage.
63	Stokes, O., Pt., F, 100th New York, age 33.	Aug. 14, 1864.	Fracture of upper third of right humerus; bone comminuted to the articulation.	Aug. 27, 1864.	Lateral flap amputation, by A. A. Surg. R. O. Sidney.	Sept. 3d, secondary hæmorrhage from axillary; stump opened and artery ligated. Died Sept. 3, '64, from effects of hæmorrhage.
64	Sutliff, W. T., Pt., B, 137th New York, age 30.	July 2, 1863.	Fracture of right humerus, followed by suppuration and sloughing.	July 5, 1863.	Amputated, by Surgeon A. K. Fifield, 29th Ohio.	July 12th, secondary hæmorrhage. Died July 26, 1863.
65	Trafton, O., Pt., F, 32d Maine, age 32.	May 18, 1864.	Shot wound through left shoulder, fracturing head of humerus; wound sloughing; scapula exposed.	May 29, 1864.	Amputated, by Surgeon R. B. Bonteeou, U. S. V.	Died May 29, 1864.
66	Voutaine, J. R., Serg't, A, 8th New York Cavalry.	June 13, 1864.	Comminuted fracture of lower part of upper third of right humerus; June 13th, excision of about four inches of shaft of humerus; June 30th and July 3d, hæmorrhages; wound gangrenous; a large slough removed; July 5th, hæmorrhages.	July 5, 1864.	Amputated at shoulder joint, by Dr. J. Boardman, Buffalo, N. York. (Sisters of Charity Hospital.)	Died July 5, 1864, six hours after operation.
67	*Wallson, R.*, Pt., I, 13th North Carolina, age 17.	May 5, 1862.	Wound thro' right wrist joint, shattering styloid process of radius and ulna; gangrene.	May 28, 1862.	Amputated, by A. A. Surgeon B. A. Vanderkieft.	June 6th, diarrhœa. Died June 9, 1862.
68	Weis, H., Pt., B, 48th New York, age 42.	Aug. 16, 1864.	Shell fracture of shaft of right humerus, extending to head; great laceration of soft tissues.	Aug. 21, 1864.	Amputated, by A. A. Surgeon W. L. Weller.	Died Aug. 31, 1864, from irritative fever.
69	[2]Welch, B. R., Serg't, H, 1st District Columbia Cavalry, age 25.	Aug. 25, 1864.	Fracture of the left shoulder; Aug. 25th, excision of shoulder joint and upper portion of humerus; Sept. 8th and 15th, hæmorrhage from circumflex arteries.	Sept. 15, 1864.	Lateral flap amputation at the shoulder joint, by A. A. Surg. J. G. Mergan.	Sept. 24th, hæmorrhage from stump; flaps laid open and arteries ligated. Died October 11, 1864. *Spec.* 3675, A. M. M.
70	Whipple, P., Pt., K, 16th Wisconsin, age 27.	June 15, 1864.	Wound of right shoulder joint; hæmorrhage from axilla.	July 3, 1864.	Flap amputation, by Surgeon E. M. Powers, 7th Missouri.	Died Aug. 4, 1864, from hæmorrhage.
71	Wiggins, R., Pt., B, 119th Pennsylvania, age 40.	May 6, 1864.	Fracture of head of right humerus and articulating portion of scapula; gangrene.	May 14, 1864.	Amputated, by Surgeon A. F. Sheldon, U. S. V.	Died May 15, 1864.
72	White, T. A., Pt., E, 28th New Jersey.	Dec. 13, 1862.	Wound of left arm, with fracture, followed by sloughing.	Dec. 16, 1862.	Amputated at shoulder joint by the oval method.	Died January 10, 1863.

[1] See *American Med. Times*, 1862, Vol. V, p. 133. [2] See Case 76, Table XXXII, p. 572 *ante*.

In sixty-six of the seventy-two fatal intermediary amputations at the shoulder for the consequences of shot injury, the operations were equally divided between the two sides, thirty-three at the right and thirty-three at the left shoulder. Some modification of transfixion and double flap incisions was the most common operative method, although the oval and circular methods, the former particularly, were frequently practised. The remarks on the causes and extent of the injuries that led to the successful amputations apply to this series also; the wounds were, for the most part, from small projectiles. Tetanus supervened in two instances, gangrene in four; three patients succumbed to the shock of operation; in one case, chloroform was assigned as the cause of death. One patient had a mortal shot perforation of the lung and liver, and six others had important wounds in other regions.

Secondary Amputations at the Shoulder Joint.—In the sixty-six reported cases of amputations at the shoulder joint after shot injury, practised later than the thirtieth day from the reception of the injury, the mortality was 28.7 per cent. In nearly two-thirds of the cases the exarticulations were secondary not only as regarded date, but followed other unsuccessful capital operations.

§ *Successful Cases.*—Forty-seven, or 71.3 per cent., of these operations resulted favorably. Forty-four of the survivors were Union soldiers and were pensioned; three were Confederates, who were released on parole or exchanged. The operations were on the right side in twenty-six, on the left in twenty-one instances. Two of the pensioners died eight and eleven years, respectively, after their discharge. No less than twenty-three patients had previously undergone amputations lower down in the limb—a significant fact, corroborating the experience of military surgeons regarding the favorable results of re-amputations at the hip after amputations in the continuity of the thigh. Six of the patients had previously undergone excisions of the upper extremity of the humerus, one an excision of the shaft, one an excision of the upper part of the radius, and one a ligation of the subclavian artery. Four of the patients had received serious wounds in other portions of the body. At the date of exarticulation, the glenoid cavity was gouged out on account of caries in one instance, and in one case consecutive hæmorrhage necessitated secondary ligation of the axillary artery.

CASE 1608.—Private F. Lafayette, Co. G, 100th Illinois, aged 26 years, was wounded at Chickamauga, September 19, 1863, and after treatment in a Twenty-first Corps hospital was sent to Nashville, and, on November 7th, was admitted to Hospital No. 19. The Specimen (FIG. 496) was contributed by the operator, Surgeon J. W. Foye, U. S. V., with the following history: "Admitted with a gunshot fracture of the upper portion of the left humerus. When he first came under observation, the soft parts of the lower half of the arm were extensively involved in gangrenous disorganization. The forearm was much swollen and œdematous. The wound in the soft parts near the head of the humerus was also gangrenous, and the patient had lost much blood from hæmorrhage, caused by sloughing of the muscular branches of the brachial. The heart's action was frequent and feeble, and the surface of the body bathed in cold perspiration. Amputation being decided upon, the patient was stimulated, and the operation performed at the joint, December 13, 1863. He bore the operation well, convalesced without a bad symptom, and is now awaiting his discharge from service." The patient was discharged February 15, 1864, and pensioned. He was paid September 4, 1874. The specimen consists of "six inches of the shaft of the left humerus, showing a consolidated gunshot fracture, from an amputation at the shoulder joint for secondary hæmorrhage and gangrene. The union is excellent, although some necrosed fragments, sources of irritation, are yet imprisoned. The head of the humerus was improperly removed in mounting the specimen." (*Cat. Surg. Sect.*, 1866, p. 112.)

FIG. 496.—Ill united shot fracture of shaft of left humerus. *Spec.* 2175.

This group of forty-seven fortunate exarticulations might be subdivided into three sub-groups, viz: Early secondary, or those practised within sixty days from the reception of injury (thirteen cases), usually on account of hæmorrhage, gangrene, or profuse suppuration,—later secondary amputations, or those performed from the end of the second to the end of the sixth month (fifteen cases), generally for hopeless disease of the humerus, some-

times with consecutive implication of the shoulder joint,—and ulterior amputations (nineteen cases), commonly performed long after the injury on account of chronic osteomyelitis, or for necrosis of the entire humerus. The following is a good example of the latter variety:

CASE 1609.—Private J. Potter, Co. H, 12th Illinois Cavalry, aged 45 years, was wounded at Cane River, April 27, 1864, and was treated in Barrack Hospital, New Orleans, from that date until January 31, 1865, when he was transferred to New York and entered De Camp Hospital. Assistant Surgeon Warren Webster, U. S. A., furnished the following special report: "The patient was wounded while charging the enemy with his company. The projectile, a cylindro-conoidal ball, penetrated the posterior and inner surface of the arm at about the middle of the humerus, was flattened upon the bone, and passing downward and outward lodged in the soft parts near the elbow joint. He states that he did not dismount in consequence of the wound, nor throw away his carbine, but rode to Alexandria, a distance of ten miles, carrying the weapon on his wounded arm. On the following day he was transferred to hospital at New Orleans, where he arrived May 1, 1864. There he first received professional attention, and on the 9th of the month the ball was removed through an incision near the elbow. The surgeon, he says, informed him that the bone had not been fractured. The anterior part of the ball was deeply indented, seemingly by impingement upon the shaft of the humerus. The wound of entrance, from the man's statement, was of such small size and regular appearance as to render it probable that the ball was of its original shape when it entered the arm. After the extraction of the missile the limb rapidly inflamed, became greatly swollen between the elbow and shoulder, and was affected with deep-seated and almost unsupportable pain. The constitutional disturbance appears also to have been correspondingly great. Local anodyne applications were employed, and morphine internally administered for several weeks. Six abscesses had appeared previously to November, 1864, some of which were opened by the knife and others allowed to break spontaneously. In that month Private Potter states that a deep incision, about three and a half inches long, was made longitudinally on the anterior aspect of the arm, apparently for the purpose of extracting necrosed bone, but the attempt was abandoned. Whenever the fistulous openings in the parts were allowed to close there was an access of deep-seated pain. The patient was transferred to De Camp Hospital in February, 1865. Upon his admission there he presented an appearance which led those who saw him to quite despair of his life. The long continuance of pain and exhausting discharges had brought him to the brink of the grave. For many months after his arrival at De Camp Hospital his hold upon existence was by the slenderest ties. By dint of most careful nursing and attention to diet, he was, however, so far improved in November as to render proper operative interference for the rescue of his life. At that time there were fourteen openings in the arm and shoulder, through which purulent matter discharged. Some of these openings did not communicate with bone, but with the axillary glands, which had taken on inflammatory and suppurative action. Through numerous cloacæ in the encasing of new osseous deposit a vast amount of necrosed bone could be detected, which appeared to extend nearly from one articulation to the other. It having been determined, in view of all the circumstances of the case, to amputate at the shoulder joint, the operation was performed by Assistant Surgeon Warren Webster, U. S. A., November 10, 1865. A deltoid flap was raised and the knife made to sweep away as much as possible of the diseased gland tissue on the inner side of the bone. The patient rallied with difficulty from the operation, but, gradually, improvement began, and, at this date, March 12, 1866, the shoulder is nearly healed, the patient has regained his health and strength, and is acting in the capacity of ward orderly in De Camp Hospital." The patient was discharged the service March 28, 1866, and pensioned. He was paid on September 4, 1874. The specimen (FIG. 497) consists of the right humerus, amputated at the shoulder joint after contusion by a conoidal ball, which is attached. The entire shaft is necrosed and surrounded by a partial involucrum. The specimen is interesting from the character of the injury, the extent of the disease, the duration of the case, and the result. It was contributed by the operator.

FIG. 497.—Necrosis of the humerus after shot injury. *Spec.* 2511. ⅓.

The next case illustrates one of the re-amputations that occurred in this category:

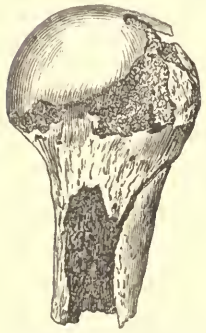

FIG. 498.—Upper portion of right humerus, carious, after amputation in the continuity for shot fracture. *Spec.* 2626.

CASE 1610.—Private W. E. Crolins, Co. A, 72d Pennsylvania, aged 30 years, was wounded at Gettysburg, July 2, 1863, and was received into a Second Corps hospital. The following was recorded on Army Corps Register No. 93: "Compound comminuted fracture of right arm. Amputated by Surgeon M. Rizer, 72d Pennsylvania." On July 29th, the patient was admitted to Camp Letterman Hospital, where Acting Assistant Surgeon G. M. Ward reported that the improvement of the patient was uninterrupted from the date of his admission until September 3d, when he was transferred to Satterlee Hospital. Acting Assistant Surgeon Thomas G. Morton contributed the specimen (FIG. 498) and reported: "Wounded by a minié ball, which passed through the upper end of his arm. Amputation was performed twelve hours afterward, leaving about six inches of bone. The flap never entirely closed, and a probe could be passed up the medullary cavity to the head of the bone, the shaft of which was also necrosed and softened. January 8th, I re-amputated the arm at the shoulder and took away the entire bone, including its head. Considerable hæmorrhage took place, and some hæmorrhage secondarily, but not to any amount, brought on by an attack of vomiting. Silver sutures were used; the patient did well. On February 10, 1864, the patient was about, the wound almost entirely healed." The Catalogue of 1866, page 115, says: "The specimen, embracing the head and two inches of the shaft, exhibits a profound degree of necrosis as existing six months after the first operation, and requiring the second." This soldier was discharged and pensioned May 3, 1864, Surgeon I. I. Hayes certifying to "amputation of the right arm at the shoulder, following gunshot wound." The pensioner was paid June 4, 1874.

TABLE XLVIII.

Summary of Forty-seven Cases of Successful Secondary Amputations at the Shoulder for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Alexander, C. H., Pt., B, 2d Maryland Artillery.	July 1, 1862.	Right forearm carried away by premature discharge of gun; July 1st, amputated at elbow joint, by Asst. Surg. J. S. O'Donnell, Purnell Legion; stump painful.	Oct. 9, 1862.	Amput'd by Larrey's method, by Act. Asst. Surg. J. A. Draper.	Disch'd Jan. 31, 1863; pensioned. *Spec.* 271, A. M. M.
2	*Alley, W.*	Aug. 15, 1864.	Fracture of the right humerus; amputated four inches below shoulder; hæmorrhage eight days after operation.	Oct. –, 1865.	Head and remaining portion of shaft removed, by Dr. J. H. Erskine.	Recovered within a month.
3	*Anderson, S. S.*, Pt., G, 27th Alabama, age 24.	Nov. 30, 1864.	Shell fracture of upper third of left humerus; gangrene.	Mar. 13, 1865.	Amputated, by Surg. Franklin, C. S. A.	May 23, 1865, recovered; sent to Provost Marshal May 31, 1865.
4	Beachy, J. F., Pt., H, 39th Illinois, age 22.	June 2, 1864.	Shot fracture of lower third of left arm; June 2d, arm amputated at the middle third; necrosis.	Jan. 17, 1865.	Amputated, by Act. Asst. Surg. W. B. McGavren.	Disch'd Mar. 15, 1865; pensioned.
5	[1]Burger, S., Pt., A, 102d Illinois, age 30.	June 15, 1864.	Ball passed through head of right humerus: June 15th, excision of head and four inches of shaft of the humerus; June 21st, hæmorrhage; discharged Dec. 17, 1864; pensioned.	June 20, 1867.	Amputated, by Dr. Madison Reese, formerly Surgeon 118th Illinois.	Still sore and running ulcer in 1870.
6	Burke, M., Serg't, K, 15th New York Artillery.	June 25, 1864.	Fracture of left ulna, elbow joint involved; July 4th, circular amputation at the upper third, by Act. Asst. Surg. H. M. Dean; parts erysipelatous; gangrene.	Mar. 29, 1865.	Head and remaining portion of shaft of humerus removed, by Acting Asst. Surg. W. B. Chambers.	Discharged November 30, 1865; pensioned.
7	Cockrun, M., Pt., C, 115th New York, age 35.	June 7, 1864.	Shot fracture of right elbow, opening joint; June 7, 1864, arm amputated near upper third, by Surg. J. M. Palmer, 3d New York, by lateral flap method; œdema.	Mar. 20, 1865.	Amputated at the shoulder and carious bone removed from glenoid cavity, by Surg. G. H. Hubbard, U. S. V.	Disch'd July 17, 1865; pensioned.
8	Craft, E., Pt., F, 126th New York, age 24.	July 2, 1863.	Left arm fractured; ball lodged; July 14th, the ball extracted; Aug. 12th, amputation at middle third; Aug. 22d, hæmorrhage from brachial, arrested by actual cautery; Dec. 18, 1863, re-amputated at upper third; caries.	Dec. 22, 1863.	Head and remaining portion of shaft removed, by Act. Asst. Surg. E. Seyfforth.	Disch'd May 19, 1865; pensioned.
9	Crolins, W. E., Pt., A, 72d Pennsylvania, age 30.	July 2, 1863.	Shot fracture of middle third of right humerus; July 2d, amputated at upper third, by Surg. M. Rizer, 72d Penn.	Jan. 8, 1864.	Amputated at the shoulder, by Acting Asst. Surgeon T. G. Morton.	Disch'd May 3, 1864; pensioned. *Spec.* 2606, A. M. M.
10	Cutler, F. R., Pt., K, 72d Pennsylvania, age 17.	Sept. 17, 1862.	Six inches of right humerus shattered; inflanimation of the medullary cavity.	Oct. 19, 1862.	Amput'd by Larrey's method, by Surg. H. S. Hewit, U. S. V.	Oct. 20th, hæmorrhage from axilla; artery ligated; discharged Aug. 10, 1864; pensioned; died May 11, 1873.
11	Dahl, J., Pt., I, 6th Kentucky.	Sept. 20, 1863.	Fracture of lower third of left humerus; September 20, 1863, amputated near upper third; soft parts indurated and inflamed.	Mar. 9, 1864.	Amput'd by Lisfranc's method, by Asst. Surg. B. E. Fryer, U. S. A.	Disch'd Mar. 8, 1865; pensioned.
12	Dale, J. W., Serg't, B, 25th Illinois, age 22.	Sept. 20, 1863.	Wound of left elbow joint; Oct. 8, 1863, amputated at junction of middle and lower thirds; necrosis.	Jan. 16, 1864.	Flap amputation at shoulder...	Mustered out September 5, 1864; pensioned.
13	Davis, J. W., Serg't, F, 64th New York, age 23.	May 12, 1864.	Fracture of metacarpal bones of left hand; gangrene; May 30, 1864, circular amputation at middle third, by Surg. A. F. Sheldon, U. S. V.; disch'd May 10, 1865; pensioned.	April –, 1868.	Amputation at the shoulder for consecutive necrosis, by Surg. D. W. Bliss, U. S. V.	Recovered.
14	[2]Dibble, A. H., Pt., F, 33d New York.	May 3, 1863.	Fracture of upper fifth of right humerus; May 4th, excision of head of humerus; gangrene.	July 22, 1863.	Amputated, by Dr. W. B. Alley, of Nunda, N. Y.	Gangrene controlled by bromine; discharged November 16, 1863; pensioned.
15	Dowd, P., Pt., K, 8th New Hampshire.	May 27, 1863.	Shot wound of left arm	July 31, 1863.	Circular amputation, Alanson's method.	Disch'd Sept. 2, 1863; served in Vet. Res. Corps, then pensioned.
16	Eldridge, J. C., Pt., H, 4th Tennessee Cavalry, age 20.	Feb. 15, 1865.	Fracture of left ulna, radius, and carpal bones; Mar. 5th, circular amputation at elbow joint, by Surg. D. Stahl, U. S. V.	June 28, 1865.	Amputation at the shoulder for gangrene, by Surg. D. Stahl, U. S. V.	Mustered out September 12, 1865; pensioned.
17	Frain, J. F., Pt., D, 1st Pennsylvania Cavalry, age 19.	June 3, 1864.	Fracture of the right humerus; June 3, 1864, lateral flap amputation at upper third, by Asst. Surg. L. E. Atkinson, 1st Pennsylvania Cavalry; Sept. 30th, stump exfoliating.	Oct. 21, 1864.	Dead stump and head of the humerus removed.	Disch'd April 1, 1865, pensioned.
18	Gilman, S. F., Pt., A, 5th Maine, age 30.	June 27, 1862.	Fracture of the right humerus; June 28th, excision of lower part of shaft, by Surg. G. E. Bricket, 5th Maine; necrosis.	Aug. 12, 1862.	Double flap amputation, by Act. Asst. Surg. H. B. Miles.	Disch'd Oct. 6, 1862; pensioned.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
19	Graham, H. A., Corp'l, H, 1st Pennsylvania Reserves.	May 10, 1864.	Fracture of right elbow joint; arm amputated at lower third, by Surg. D. W. Bliss, U. S. V.; discharged Oct. 8, 1864; pensioned; Sept., 1866, re-amputation of arm.	July –, 1869.	The remaining portion of humerus, including the head, removed, by Dr. W. H. Hess, of Nebraska City.	Did well after the operation.
20	Haney, J., Pt., C, 134th Pennsylvania.	Dec. 13, 1862.	Wound of left shoulder joint; mustered out May 26, 1863; pensioned.	June –, 1865.	Amputated at the shoulder for caries, by Dr. A. G. Walter, of Pittsburg, Pa.	In August, 1866, stump was still discharging.
21	*Hearnsburger*, A., Pt., G, 15th Georgia, age 24.	July 2, 1863.	Fracture of head and neck of left humerus; necrosis.	Oct. 28, 1863.	Lateral flap amput'n, by Act. Asst. Surg. James E. Steel.	Sent to Fort Delaware April 9, 1864.
22	Heim, Isaac, Corp'l, I, 53d Pennsylvania.	July 2, 1863.	Wound of right arm; necrosis.	Aug. 6, 1863.	Amputated, by Act. Asst. Surg. A. W. Colburn.	Disch'd July 29, 1864; pensioned.
23	Hunter, J. H., Corp'l, B, 12th New York.	June 27, 1862.	Wound of right elbow joint; July 7, 1862, amputated, by Act. Asst. Surg. A. Claude; discharged Sept. 6, 1862; pensioned.	April 30, 1863.	Amputated at the shoulder by flap method, by Surg. A. B. Mott, U. S. V.	Recovered. Died Aug. 11, 1871.
24	[1]Keeler, Wm., Pt., M, 8th New York Artillery.	June 23, 1864.	Fracture of upper third of right humerus; June 23, 1864, excision of head and part of shaft, by Surg. A. Churchill, 8th New York Artillery; disch'd February 25, 1865.	Oct. 1, 1866.	Amputated, by Dr. T. A. McArthur, of Soldiers' Home, Philadelphia.	Recovered; a pensioner.
25	[2]Kennier, B., Pt., I, 2d Massachusetts, age 27.	Sept. 17, 1862.	Right humerus fractured; Nov. 20, 1862, head and part of shaft excised, by Surg. A. B. Hasson, U. S. A.; caries.	Feb. 10, 1863.	Amputated, by Surg. A. B. Hasson, U. S. A.	Disch'd April 23, 1863; pensioned.
26	Knapler, J., Pt., L, 5th Pennsylvania Cavalry, age 27.	May 8, 1864.	Wound of lower third of left arm by explosive ball; elbow joint opened; osteomyelitis.	June 24, 1864.	Amputated, by Act. Asst. Surg. E. De Witt.	Mustered out December 23, 1864; pensioned.
27	Lafayette, F., Pt., G, 100th Illinois, age 26.	Sept. 19, 1863.	Fracture of upper part of shaft of left humerus; hæmorrhages from branches of brachial.	Dec. 13, 1863.	Amputated, by Surgeon J. W. Foye, U. S. V.	Disch'd Feb. 15, 1864; pensioned. *Spec.* 2175, A. M. M.
28	Lautz, J. A., Corp'l, C, 67th Ohio.	Mar. 24, 1862.	Right humerus fractured; ostitis and profuse suppuration.	April 28, 1862.	Amputated, by Surgeon A. D. Gall, 13th Indiana.	Disch'd June 3, 1862; pensioned.
29	May, D., Pt., D, 96th Ohio..	Jan. 11, 1863.	Fracture of left humerus at junction of middle and upper third; July 20, 1863, gangrene; July 26th, hæmorrhage from brachial.	July 26, 1863.	Amputated, by Surgeon C. T. Alexander, U. S. A.	Disch'd Sept. 21, 1863; pensioned.
30	Mead, Jacob, Pt., I, 58th Indiana.	Dec. 31, 1862.	Wound of the left arm above elbow; January 1, 1863, arm amputated, by Asst. Surg. J. R. Adams, 58th Indiana.	Feb. 4, 1863.	Amputated at the shoulder, by Surg. A. Ewing, 13th Mich.	Disch'd Aug. 13, 1863; pensioned.
31	[3]Mesley, C. L., Pt., A, 18th Infantry, age 31.	July 4, 1864.	Shell wound of right shoulder and breast; July 4th, excision of shoulder joint.	Aug. 8, 1864.	Amputated at the shoulder, by Asst. Surg. Theo. McGraw, U. S. V.	Disch'd Dec. 31, 1864; pensioned.
32	Miller, W., Corp'l, H, 16th Ohio.	Dec. 28, 1862.	Wound of left arm; January 11, 1863, arm amputated, by Act. Asst. Surg. H. Hard.	Jan. 28, 1863.	Amputated at shoulder joint...	Disch'd April 14, 1863; pensioned.
33	Phelps, J. T., Pt., D, 24th Massachusetts, age 32.	Aug. 16, 1864.	Comminution of neck of left scapula and head of left humerus; Sept. 26th, hæmorrhage from axillary; subclavian ligated, by Act. Asst. Surg. J. C. Morton.	Sept. 26, 1864.	Amputated, by Act. Asst. Surg. J. E. Chesley; flap operation.	Disch'd Dec. 13, 1864; pensioned.
34	Poole, Theo. L., Lieut., H, 122d New York, age 25.	June 1, 1864.	Compound fracture of left arm, middle third.	Feb. 15, 1865.	Amputated, by Surgeon F. M. Everleth, 1st Maine.	Disch'd May 15, 1865; pensioned.
35	Potter, J., Pt., H, 12th Illinois Cavalry, age 45.	Ap'l 27, 1864.	Fracture of right humerus; entire humerus necrosed; fourteen fistulous orifices.	Nov. 10, 1865.	Amputated, by Asst Surg. W. Webster, U. S. A. See CASE 1609, p. 646.	Disch'd Mar. 28, 1866; pensioned. *Spec.* 2511, A. M. M. FIG. 497.
36	Powers, P., Pt., C, 24th Massachusetts, age 22.	Aug. 16, 1864.	Wound of right arm; August 16th, amputated three inches below shoulder joint; necrosis.	April 13, 1865.	Amputated, by Act. Asst. Surg. F. C. Roper.	Disch'd June 17, 1865; pensioned.
37	Richards, B., Pt., G, 4th New Hampshire, age 29.	Feb. 21, 1865.	Wound of right elbow joint; February 21st, amputation at the middle third; March 27th, hæmorrhage controlled by ligation; discharged June 11, 1865; pensioned.	1865.	Subsequently amputated at the shoulder joint.	Recovered.
38	[4]Rosa, J. W., Pt., L, 2d New York Artillery, age 24.	May 24, 1864.	Shell wound of right shoulder, humerus fractured; May 25th, head and part of shaft excised; discharged October 3, 1864; pensioned.	Dec. 27, 1865.	Amput'd, by Dr. H. S. Streeter, of Salisbury, New York.	A pensioner.
39	Sanders, J., Pt., H, 6th Illinois Cavalry, age 19.	May 12, 1863.	Fracture of head of right humerus and coracoid process.	July 10, 1863.	Amputated, by Surgeon J. G. Keenon, U. S. V.	Disch'd Oct. 9, 1863; pensioned. *Spec.* 1700, A. M. M.
40	Sias, G. W., Pt., G, 62d Pennsylvania.	June 27, 1862.	Fracture of upper third of left humerus; July 4th, circular amputation at upper third; discharged August 28, 1862; pensioned.	.....	Re-amputated at shoulder, by Dr. G. McCook, at Pittsburg.	A pensioner.
41	Smedley, F. L., Pt., H, 47th Pennsylvania, age 22.	Oct. 19, 1864.	Fracture of lower third of right arm, elbow joint involved; Oct. 19, amputation at middle third; discharged Dec. 28, 1864; pensioned.	Aug. 30, 1865.	Re-amputated, by Dr. J. H. Heinsling, of Newport, Pa.	Disch'd and pensioned. Applied for commutation in place of artificial limb, August, 1870. *Spec.* 2850, A. M. M.
42	Smiley, S. C., Corp'l, A, 33d Massachusetts.	May 15, 1864.	Fracture of clavicle and head of right humerus; parts infiltrated.	April 25, 1865.	Amputated, by Act. Asst. Surg. G. S. Stebbins; oval flap.	Disch'd July 8, 1865; pensioned.
43	Smith, W. W., Pt., C, 21st Wisconsin, age 29.	Sept. 19, 1863.	Left humerus at middle third; January 11, 1864, arm amputated; caries.	Feb. 13, 1865.	Remaining portion of humerus disarticulated, by Surg. H. Culbertson, U. S. V.	Disch'd July 19, 1865; pensioned.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
44	Stearns, G., Pt., A, 31st Wisconsin, age 38.	Mar. 19, 1865.	Right arm, at junction of upper and middle third; April 26, 1865, amputated at the upper third; remaining bone found fractured.	April 25, 1865.	Amputated at the joint, by Asst. Surg. S. H. Orton, U. S. A.	Disch'd June 15, 1865; pensioned.
45	Steen, B. S., Serg't, C, 14th New York Militia.	Aug. 29, 1862.	Right elbow joint shattered; discharged Dec. 16, 1862; pensioned.	Mar. 23, 1864.	Amputated, by Dr. J. Johnson, of Brooklyn.	Wound healed.
46	Watson, Wm. D., Lieut., E, 71st Pennsylvania.	June 3, 1864.	Fracture of right radius; June 3, 1864, radius excised, by Surg. M. Rizer, 72d Penn.; mustered out July 2, 1864; pensioned.	July 23, 1864.	Amputated secondarily for secondary hæmorrhage and gangrene.	Wound healed.
47	Yates, O. J., Pt., F, 11th Maine, age 37.	Aug. 16, 1864.	Fracture of metacarpals of left hand; gangrene; Sept. 15, 1864, arm amputated at lower third; discharged January 20, 1865; pensioned.	June 29, 1865.	Amputated at the joint, by Dr. W. T. Black, of Maine.	Healed.

§ *Unsuccessful Operations.*—Of the nineteen cases in this category, nine had been subjected to amputation, excision, or ligation of the principal trunk prior to the exarticulation. The right limb was removed in twelve of the seventeen instances in which this point is specified. Sixteen of the patients were Union, and three Confederate soldiers. Pyæmia was the commonest cause of death, being reported in six cases. One patient died from tetanus, and, in another, the fatal result was referred to "cardiac syncope from chloroform." Rupture of an axillary aneurism, general shock from operation, and pleurisy are each, in one instance, assigned as the cause of death. Exhaustion or surgical fever are made to account for the remaining fatal terminations. As an example of this group, a case in which a primary excision in the continuity, a secondary amputation, and finally an exarticulation were practised may be selected:

Fig. 499.—Humerus that has undergone excision of the shaft and exarticulation at the shoulder. *Spec.* 3331.

Case 1611.—Private J. M———, Co. E, 22d Massachusetts, aged 38 years, was wounded at the Wilderness, May 5, 1864, and was taken to a Fifth Corps hospital. Surgeon W. R. De Witt, jr., U. S. V., noted: "Gunshot wound of right arm; exsection of upper part of shaft of humerus, May 6th." The patient was sent to Washington and entered Harewood Hospital. Surgeon R. B. Bontecou, U. S. V., reported: "On admission to this hospital, May 28, 1864, the patient was in poor health, suffering from abscesses in the arm, the wound suppurating freely. The patient did well until August 18th, when the parts became sloughy, with profuse sanious discharge; but by applications of astringent lotions the arm improved up to September 17th, when secondary hæmorrhage from the profunda occurred, amounting to about eight ounces. The artery could not be secured, and amputation was deemed necessary, and was performed by the surgeon in charge by bilateral flaps. The patient reacted promptly, and did tolerably well until September 19th, when hæmorrhage again occurred, this time from the anterior circumflex artery. The humerus was exarticulated and the bleeding vessel ligated. The stump, however, became gangrenous, and the patient sank from exhaustion, and died September 26, 1864. There were no pyæmic symptoms existing. Treatment, supporting throughout." The specimen (Fig. 499), contributed by the operator, consists of the right humerus, from which three inches of the shaft has been excised. The arm was subsequently amputated in the continuity, and disarticulation at the shoulder joint was finally performed. "The lower portion of the specimen, representing the condition nearly four and a half months after the injury, * * exhibits a copious deposit of spongy new bone, surrounding a nearly detached sequestrum of several inches. The shaft in the upper fragment is necrosed at the extremity, and the articular surface is eroded." (*Cat. Surg. Sect.*, 1866, p. 112.)

In the fatal, as in the successful secondary exarticulations, an unusual predominance of operations on the right side is observed. In seventeen unsuccessful amputations in which this point is specified, twelve were at the right shoulder. The fatality of the secondary exceeds that of the primary exarticulations by 4.6 per cent., and is 17.1 per cent. less than the intermediary amputations. It will be noticed that nearly all of the fatal secondary exarticulations were compulsory amputations, and consecutive to prior operative interference, the surgeons contesting the ground inch by inch. There were three instances

of previous amputation of the arm in the continuity. Two excisions in the continuity of the shaft of the humerus, one excision of the head and upper extremity of the shaft, two ligations of the brachial, and one of the anterior circumflex were practised prior to the exarticulations. In one case, the subclavian artery was tied after the amputation at the shoulder. Two patients had serious wounds in other regions of the body.

TABLE XLIX.

Summary of Nineteen Fatal Cases of Secondary Amputation at the Shoulder for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	Babbitt, A., Pt., D, 66th Indiana.	June 1, 1863.	Shot perforation of left wrist joint, followed by gangrene.	July 2, 1863.	Amputation of arm at shoulder joint, by Surg. J. G. Keenon, U. S. V.	Did not rally from shock of operation. Died July 4, 1863. *Spec.* 1705, A. M. M.
2	*Battle, W. T.*, Lieut., D, 37th North Carolina, age 19.	July 2, 1863.	Comminuted fracture of left humerus at upper third by a conoidal ball. July 3d, excision of three inches of shaft of humerus.	Aug. 23, 1863.	Amputation of arm at shoulder joint.	Died August 23, 1863, three hours after operation.
3	Blakely, A., Pt., I, 3d Michigan Cavalry.	June 16, 1863.	Wound of left arm by buckshot. July 10th, hæmorrhage; brachial artery ligated, by Surg. B. A. Vanderkieft, U. S. V. July 10th, amp. of arm at upper third, by A. A. Surg. A. Claude. Gangrene and hæmorrhage.	July 24, 1863.	Amputation of arm at shoulder joint, by Surg. B. A. Vanderkieft, U. S. V.	Died July 26, 1863.
4	Brown, N. C., Pt., E, 59th Illinois, age 25.	Dec. 31, 1862.	Musket ball perforated arm near insertion of deltoid, causing compound comminuted fracture; caries.	Feb. 14, 1863.	Arm amputated at shoulder joint.	Died March 31, 1863, of diarrhœa.
5	*Catis, J. R.*, Pt., E, 1st Tennessee.	July 3. 1863.	Shot wound of right arm by a conoidal ball; sloughing and hæmorrhage.	Aug. 8, 1863.	Amputation of arm at shoulder joint, by A. A. Surg. J. B. Draper.	Died September 25, 1863.
6	Charters, W. S., Pt., D, 145th Pennsylvania, age 18.	May 12, 1864.	Shot fracture of left arm. May 12th, excision of portion of humerus, by Ass't Surgeon B. Howard, U. S. A. Oct. 7th, amp. at upper third of arm on account of necrosis.	Oct. 7, 1864.	Disarticulation at the shoulder joint.	Died Oct. 21, 1864, of tetanus.
7	Doherty, P., Serg't, C., 173d New York, age 43.	April 9, 1864.	Compound comminuted shot fracture of upper third of right humerus.	July 7, 1864.	Amputation of arm at shoulder joint, by A. A. Surg. F. Hassenburg.	Died July 7, 1864, of cardiac syncope by chloroform.
8	Fagan, M., Pt., G, 72d New York, age 50.	May 5, 1862.	Shot wound through the right shoulder.	June 12, 1862.	Oval amputation at shoulder joint, by Dr. Willard Parker.	Died June 12, 1862, an hour after amputation.
9	Forrest, A. W., Pt., K, 141st Pennsylvania, age 21.	May 7, 1864.	Shot fracture of right humerus.	June 7, 1864.	Amputat'n at shoulder joint, by Surg. A. F. Sheldon, U. S. V.	Died June 29, 1864, of pyæmia.
10	Gallagher, C., Pt., C, 169th New York, age 32.	June 1, 1864.	Shot fracture of upper third of right humerus. June 6th, excision of two and a half inches of humerus.	Jan. 12, 1865.	Arm amputated at shoulder joint, by A. A. Surgeon H. Pearce.	Died March 3, 1865, from exhaustion. *Specs.* 383 and 3608, A. M. M.
11	Hoffman, A. J., Pt., E, 26th Iowa, age 55.	Jan. 11, 1863.	Comp'd shot fracture of right arm. March 12th, arm amputated at middle third.	May 10, 1863.	Amputation at shoulder joint.	Died June 3, 1863, of pyæmia.
12	*Jackson, I. P.*, Corporal, E, 11th Florida.	July 30, 1864.	Shot wound of the right arm..	Sept. 7, 1864.	Amputation of arm at shoulder joint.	Died September 9, 1864.
13	Monohan, J., Corp'l, E, 22d Massachusetts, age 38.	May 6, 1864.	Shot fracture of middle third of right humerus. May 6th, excision of three inches of humerus. Sept. 17th, arm amp. at upper third, by Surg. R. B. Bontecou, U. S. V.	Sept. 19, 1864.	Amputation of arm at shoulder joint and ligation of anterior circumflex artery. See CASE 1611, p. 649.	Died September 26, 1864, from exhaustion. *Spec.* 3331, A.M. M. See FIG. 499.
14	Moore, W. K., Pt., E, 57th Massachusetts, age 23.	Oct. 8, 1864.	Shot fracture of right humerus. Oct. 8th, excision of portion of shaft of humerus.	Nov. 11, 1864.	Arm amputated at the shoulder joint, by A. A. Surgeon J. C. Morton. Nov. 21st, hæmorrhage from axillary artery; subclavian ligated, by Ass't Surg. C. Wagner, U. S. A.	Died November 27, 1864, from exhaustion.
15	[1]Mullan, P., discharged soldier, age 30.	Jan. 29, 1862.	Shot wound of upper third of arm and thoracic parietes, with injury to humerus. Oct. 20th, hæmorrhage; ligation of brachial artery, by Drs. W. Parker and S. Smith.	Oct. 21, 1862.	Amputation by flap method, at shoulder joint, by Drs. W. Parker and S. Smith.	Died Nov. 5, 1862, of pleurisy.
16	Nason, H. J., Serg't, F, 28th Massachusetts.	May 16, 1864.	Shot wound of right arm; gangrene.	Aug. 9, 1864.	Amputat'n at shoulder joint, by A. A. Surg. T. B. Townsend.	Died August 12, 1864.
17	Orbin, J., Pt., F, 63d Pennsylvania, age 33.	June 16, 1864.	Shot fracture of left humerus, upper third; anterior portion of inferior maxilla carried away.	July 17, 1864.	Amputation of arm at shoulder joint, by Surg. R. B. Bontecou, U. S. V.	Died July 20, 1864. *Spec.* 3056, A. M. M.
18	Sanders, J., Pt., D, 89th Indiana, age 28.	July 14, 1864.	Musket ball splintered right humerus and lodged.	Aug. 15, 1864.	Amputation at shoulder joint, by A. A. Surg. J. Brey.	Died Sept. 22, 1864, of pyæmia.
19	Smith, J., Pt., K, 143d Pennsylvania, age 27.	May 5, 1864.	Shot fracture of upper third of right humerus. May 6th, excision of head and portion of shaft of humerus through a straight incision, by a Confederate surgeon.	Nov. 3, 1864.	Arm amputated at shoulder joint. Nov. 24th, profuse secondary hæmorrhage.	Died November 24, 1864, from the rupture of a large axillary aneurism.

[1] PECK (W. F.), *Amputation at the Shoulder Joint*, in *Am. Med. Times*, 1863, Vol. VI, p. 137.

Amputations at the Shoulder, the Period of Operation doubtful.—There were one hundred and thirty instances in which either the date of injury, or of operation, or both data were wanting, and which, therefore, could not be inserted in groups of exarticulations in the primary, intermediary, or secondary stages. The results as to fatality were ascertained in one hundred and nineteen of these cases.

§ *Successful Operations.*—Ninety-one cases in this category, or 76.5 per cent., terminated favorably. Eighty-eight of the patients were Confederate soldiers; three were Union soldiers, whose names are now on the Pension Roll:

TABLE L.

Summary of Ninety-one Successful Cases after Amputation at the Shoulder for Shot Injury in which the Intervals between the Injuries and Operations were not ascertained.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	*Ailiff, P. C.*, Pt., C, 18th Virginia, age 18.	July 3, 1863.	Shot fracture of upper part of humerus.	July –, 1863.	Amputation of arm at shoulder joint.	Recovered; paroled Aug. 22, 1863.
2	*Allen, G.*, Pt., F, 4th Texas.	July –, 1863.	Shot wound of the shoulder....	July –, 1863.	Amputation of arm at shoulder joint.	Paroled August 24, 1863.
3	*Anderson, J. T. C.*, Pt., K, 48th Alabama.	July –, 1863.	Shot wound of the shoulder....	.....	Amputation of arm at shoulder joint.	Doing well.
4	*Billingsley, J. M.*, Pt., A, 43d North Carolina.	July –, 1863.	Shot fracture of left humerus..	July –, 1863.	Amputation at shoulder joint..	Paroled September 23, 1863.
5	*Blackwell, R. B.*, Pt., H, 56th Virginia, age 28.	.....	Gunshot wound of left arm....	.....	Amputation at shoulder joint..	Retired from service Mar. 1, 1865.
6	*Bledsoe, F. M.*, Lieut., I, 11th Georgia, age 27.	July 3, 1863.	Shot wound of right shoulder..	.....	Amputation of arm at shoulder joint.	Furloughed June 27, 1864.
7	*Brown, M.*, Pt., K, 3d Alabama.	May 3, 1863.	Shot wound of right shoulder..	.....	Amputation at shoulder joint.	Furloughed June 12, 1863.
8	*Butler, W. A.*, Corporal, F, 61st Virginia, age 22.	Aug. 19, 1864.	Gunshot wound of right shoulder.	.....	Amputation at shoulder joint..	Retired March 16, 1865.
9	*Byrd, A.*, Pt., B, 50th Georgia.	May 3, 1863.	Gunshot wound of arm.....	.....	Amputation of arm at shoulder joint.	Furloughed June 13, 1863.
10	*Byrnes, P.*, Sergeant, I, 6th Louisiana.	Sept. 17, 1862.	Shot wound of left shoulder..	.....	Amputation of arm at shoulder joint.	Furloughed February 9, 1864.
11	*Carter, R.*, Pt., C, 11th Georgia.	Aug. 25, 1864.	Shot wound of right shoulder..	.....	Amputation of arm at shoulder joint.	Furloughed October 28, 1864.
12	*Clark, C.*, Corporal, I, 8th Louisiana.	July –, 1863.	Shot wound of shoulder.....	July –, 1863.	Amputation of arm at shoulder joint.	Transferred, for exchange, Aug. 24, 1863.
13	*Collins, T. L.*, Corporal, G, 61st Virginia, age 32.	Aug. 19, 1864.	Gunshot wound of left arm....	.....	Amputation of arm at shoulder joint.	Retired from service Jan. 23, 1865.
14	*Cox, J. W.*, Pt., K, 47th Virginia.	May 2, 1863.	Shot wound of right arm.....	.....	Amputation of arm at shoulder joint.	Furloughed September 17, 1864.
15	*Crawford, M. P.*, Pt., G, 9th Mississippi, age 27.	.....	Shot wound of right shoulder..	.....	Amputation of arm at shoulder joint.	Retired from service Jan. 31, 1865.
16	*Crow, F. W.*, Sergeant, I, 6th Virginia.	May 3, 1863.	Shot wound of right shoulder..	.....	Amputation of arm at shoulder joint.	Discharged February 17, 1864.
17	*Dees, H.*, Pt., E, 7th South Carolina, age 38.	June 30, 1864.	Gunshot wound of upper third of left arm.	.....	Amputation of arm at shoulder joint.	Furloughed August 20, 1864.
18	Eckles, J. A., Pt., G, 14th Ohio, age 20.	Sept. 19, 1863.	Shot fracture of left humerus..	.....	Amputation of arm at shoulder joint.	Disch'd Mar. 29, 1864; pensioned. Subsequently served in Co. A, 43d Infantry. Died June 6, 1870.

89	*Wheeler, C.*, Sergeant, F, 8th Georgia.	Dec. 10, 1864.	Gunshot wound of right arm...	.....	Amputation at shoulder joint.	Discharged June 13, 1865.
90	*Willkousky, L.*, Pt., B, 9th Louisiana.	April 30, 1863.	Gunshot wound of arm.....	.....	Amputation at shoulder joint	Furloughed June 7, 1863.
91	*Wyedmer, A.*, —, Dobaldsville Artillery.	.....	Shot wound of arm.....	.....	Amputation at shoulder joint..	Transferred to Danville March 12, 1863.

Amputation was on the right side in forty-five, on the left in twenty-eight instances; in eighteen cases, this point was unnoticed. The method of operation was nowhere specified. In one case, an amputation above the elbow, and, in another, an excision of the upper extremity of the humerus, preceded the amputation at the shoulder. In one case, excision of a portion of the fibula was practised at the same time as the amputation. Eighty-five of the men were exchanged, paroled, released, or furloughed; two were discharged, and four were not accounted for. In one case, probably a primary one, the arm was torn off by a cannon shot; in the remainder the character of the projectile was not referred to, or else the wound was ascribed to a musket ball.

§ *Unsuccessful Operations.*—Twenty-eight cases, in the series of amputations at the shoulder for shot injury, in which the stage at which the operations were practised could not be determined with precision, resulted fatally:

Table LI.

Summary of Twenty-eight Fatal Cases of Amputation at the Shoulder for Shot Injury, in which the Intervals between the Injuries and Operations were not ascertained.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	*Andrews, S.*, Pt., I, 57th N. Carolina.	1863.	Wound of right shoulder.....	1863.	Amputated at the shoulder....	Died June 24, 1863.
2	Baker, J., Sergeant, A, 61st New York.	May 8, 1864.	Shot fracture of right humerus.	May –, 1864.	Amputated at the shoulder, by Surg. J. W. Wishart, 140th Pennsylvania.	Died June 25, 1864.
3	Bradley, J., Pt., A, 2d Connecticut Artillery.	June 2, 1864.	Wound of right arm and chest.	June –, 1864.	Amputated at the shoulder....	Died June 11, 1864.
4	*Chambers, B.*, Pt., D, 4th Alabama.	1862.	Shot fracture near shoulder....	1862.	Amputated at the shoulder....	Died September 18, 1862.
5	*Cheney, —*, 2d South Carolina, age 30.	Sept. 17, 1862.	Wound of right arm; constitutional syphilis; amputation of arm.	1862.	Re-amputation at the shoulder, by Surg. J. J. Knott, C. S.A.	Died.
6	*Cobb, S. S.*, Pt., B, 41st Alabama.	1865.	Wound of arm and fracture of right tibia.	1865.	Amputated at the shoulder....	Died February 4, 1865.
7	Dillworth, L., Serg't, C, 61st Pennsylvania.	1862.	Wound of shoulder.....	1862.	Amputated at the shoulder....	Died June 28, 1862, of pyæmia.
8	Downey, A., Pt., I, 116th Pennsylvania.	Dec. 13, 1862.	Compound fracture of left humerus.	Dec. –, 1862.	Amputated at the shoulder	Died January 6, 1863.
9	*Edwards, J. D.*, Pt., F, 44th North Carolina.	1864.	Shot wound near shoulder.....	1864.	Amputated at the shoulder....	Died June 11, 1864.
10	Everly, F. M., Pt., G, 17th Kentucky.	April 7, 1862.	Fracture of right humerus.....	April –, 1862.	Amputated at the shoulder....	Died April 20, 1862, from sec'd'ry hæmorrhage from subclavian.
11	Gaines, John P., Pt., D, 11th Kentucky.	Dec. 30, 1862.	Wounds of both legs and shoulder.	1862(?).	Amputated at the shoulder....	Died March 31, 1863.
12	*Goodrich, C. O.*, H, 12th Virginia.	1864.	Shot fracture of upper third of humerus.	1864.	Amputated at the shoulder....	Died November 21, 1864.
13	*Horner, —*, Pt., I, 5th Texas.	July –, 1863.	Wound at shoulder joint.....	July –, 1863.	Amputated at the shoulder....	Died July 17, 1863.

No.	Name, Age, and Military Discription.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
14	Johnson, G. F., Pt., K, 4th Maine.	July –, 1863.	Wound of left arm.....	July –, 1863.	Amputated at the shoulder....	Died July 9, 1863.
15	Kinsey, B., Pt., D, 53d Pennsylvania.	1865.	Wound of left shoulder	1865.	Amputated at the shoulder....	Died April 17, 1865, from secondary hæmorrhage.
16	*Miller, J. A.*, Pt., B, 18th Georgia.	1863.	Wound of right shoulder.....	1863.	Amputated at the shoulder....	Died June 2, 1863.
17	*Moor, C. H.*, Serg't, H, 61st Georgia.	1862.	Shot wound of shoulder joint..	1862.	Amputated at the shoulder....	Died July 3, 1862.
18	*Padgett, T. H.*, Pt., F, 26th Virginia.	1864.	Shot fracture near shoulder....	1864.	Amputated at the shoulder....	Died June 29, 1864.
19	*Ransom, B. H.*, F, 4th South Carolina.	1861.	Shot fracture of upper third of humerus.	1861.	Amputated at the shoulder....	Died August 2, 1861.
20	Sanderson, Geo., Serg't, K, 44th Indiana.	April 6, 1862.	Wound of left arm, high up...	1862.	Amputated at the shoulder....	Died May 14, 1862.
21	*Shaw, C.*, Pt., E, 48th Alabama.	July –, 1863.	Wound of arm, with fracture..	July 3, 1863.	Amputated at the shoulder....	Died July 20, 1863.
22	Smith, G. D., Pt., E, 11th Pennsylvania.	Aug. 30, 1862.	Wound of arm, with fracture near shoulder.	1862.	Amputated at the shoulder....	Died September 11, 1862.
23	Smith, James, Pt., Naval Battery.	1865.	Shot fracture of upper third of os brachii.	1865.	Amputated at the shoulder....	Died April 18, 1865.
24	*Toole, J.*, Pt., D, 14th Louisiana.	1862.	Shot wound, with fracture of humerus.	1862.	Amputated at the shoulder....	Died July 3, 1862.
25	Townsend, H. M., Corp'l, I, 9th Iowa.	Mar. 8, 1862.	Wound of right arm near the shoulder.	1862.	Amputated at the shoulder....	Died April 23, 1862.
26	*Tuten, J.*, Pt., B, 5th South Carolina Cavalry.	1864.	Wound of arm; fracture of left femur.	1864.	Amputated at the shoulder....	Died December 20, 1864.
27	*Williams, J.*, Pt., D, 46th North Carolina.	1864.	Wound of arm and penetrating wound of thorax.	1864.	Amputated at the shoulder....	Died September 15, 1864.
28	*Williford, T.*, Pt., G, 2d North Carolina.	July –, 1863.	Fracture of left humerus.....	July –, 1863.	Amputated at the shoulder....	Died August 5, 1863.

The side on which the amputation was practised was specified in only twelve (right 7, left 5) of the twenty-eight cases. In some instances the period of operation was implied, though not with precision.[1] One operation was a reamputation. Twelve of the patients were Union, and sixteen Confederate soldiers.

§ *Operations with Unknown Results.*—In eleven cases of shoulder joint amputations for shot injury, compiled from authentic but very scant memoranda, it was impracticable to ascertain the results as to recovery or fatality, or the exact dates of operation:

Table LII.

Summary of Eleven Cases of Amputations at the Shoulder, in which neither the Results nor the Periods intervening between the Injuries and the Operations were ascertained.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	*Bruce, J. D.*, Major, 47th Virginia.	1863.	Shot wound of left arm	1863.	Amputated at the left shoulder.	It is hoped and requested that any one cognizant of the exact dates, or of the terminations of any of the cases in this category, will communicate the facts to the Surgeon General's Office.

11	*Staton, Wm.*, Corp'l, C, 10th North Carolina Battery.	1864.	Shot fracture of left humerus..	1864.	Amputation at the shoulder....	

This series completes the reported cases of amputation at the shoulder for shot injury. All of these cases were taken from Confederate records. In the six instances in which

[1] Cases 3, 4, 8, 13, 14, 16, 17, 19, and 28 were probably primary exarticulations, and much the larger proportion of the cases appear to have been either primary or early intermediary operations. It is hardly possible to suppose circumstances that would warrant so considerable a number of exarticulations at the shoulder, in cases attended by probably mortal wounds elsewhere, as are here recorded: *E. g.*, in Cases 3 and 27, there were penetrating wounds of the thorax; in Case 26, fracture of the femur; in Case 11, wounds of both legs, etc.

the point was noticed, the operations were equally divided between the right and left sides. No complications, or prior or consecutive operations, are mentioned in the reports.

Recapitulation.—In the foregoing subsection, eight hundred and fifty-two exarticulations at the shoulder,[1] for shot injury, or for disease consequent on shot injuries, or the operations undertaken for their relief, have been enumerated. Four hundred and ninety-nine cases related to primary operations, one hundred and seventeen terminating fatally, the results in fourteen cases being unknown, and the remaining three hundred and sixty-eight resulting successfully,—a mortality rate for the determined cases of 24.1 per cent. Fifteen of the successful and two of the unsuccessful cases were detailed, with five cuts from photographs of recovered patients, and eight cuts representing the pathological specimens preserved. One hundred and fifty-seven cases of intermediary exarticulations were illustrated by details of three successful and three unsuccessful operations, with a wood-cut of a case of recovery, a plate and five cuts showing osteological specimens. The fatality in this series, in which the termination of all the cases was determined, was 45.8 per cent. Sixty-six secondary exarticulations were recorded, with details of one fatal and three successful operations, and wood-cuts of four specimens, and tabulations showing a mortality rate of 28.7 per cent. A fourth series, embracing one hundred and thirty cases, in which it was impracticable to determine precisely the interval between the injury and operation, included one hundred and nineteen in which the result as to fatality was known to be 23.5 per cent. The facts ascertained regarding these cases were presented in tabular form. The mean death-rate of the entire series of eight hundred and twenty-seven cases was 28.5 per cent. Adding fourteen cases, from the preceding Section, in which exarticulation at the shoulder was practised on account of lesions of the blood-vessels or the soft parts, this series of eight hundred and forty-one cases gives a ratio of mortality of 29.1. In seven hundred and sixty-six of these cases the side on which the operation had been practised was specified, and a slight predominance in number and fatality on the right side was indicated: in three hundred and ninety-one amputations at the right shoulder, the death-rate was 25.2 per cent.; in three hundred and seventy-five exarticulations on the left side, the mortality was 24.9 per cent.

---

[1] On exarticulation at the shoulder, the following authorities, besides those cited on page 613, may be consulted: PLATNER (J. Z.) (*Institutiones Chirurgiæ rat.*, Lipsiæ, 1778, § 251, p. 125) describes his method of operating; LE LAUMIER et POYET (*De methodis amputandi brachium ex articulo*, Paris, 1759) devote a thesis to the operative details; VAN GESCHER (*Verhandeling van het afzetting der dye in het gewricht*, Amsterdam, 1760) has a treatise on the ablation of the arm at the shoulder; BRASDOR (P.) treats of exarticulation at the shoulder in his essay *Sur les amputations dans les articles*, in the *Mém. de l'Acad. de Chir.*, 1774, T. V, p. 747; ALANSON (E.) describes his circular method, in his *Practical Observations on Amputation and the After-treatment*, London, 1782; HASELBERG (L. W.), in 1782, published, at Göttingen, a *Commentatio chirurgica, in qua novum humerum ex articulo extirpandi methodum* is contained; FLAJANI (G.) wrote *Osservatione pratiche sopra l'amputazione degli articoli*, Roma, in 1791; SEEBURG (D.), in 1795, published at Wittemberg an example of successful ablation of the arm at the shoulder: *Exturpatio ossis humeri exemplo felice prabata*; MURSINNA (C. L.) printed in his journal, 1801, B. 1, S. 101, a paper *Von der Ablösung des Armes im Schultergelenke*; SCHREINER'S dissertation, *Über die Amputation grosser Gliedmassen nach Schusswunden*, Leipzig, 1807, includes a section on amputations at the shoulder. Dissertations on the subject follow in rapid succession, as those by WALTHER (P. F.) (*Über die Amputationen in den Gelenken*, Landshut, 1810); KLOSS (G.) (*De amputatione humeri ex articulo*, Göttingen, 1809, Frankfort, 1811); FRASER (W. W.) (*An Essay on the Shoulder Joint Operation*, London, 1813). Concluding Observations on Shot Injuries at the Shoulder.—In this Section, twenty-three hundred and twenty-eight of shot injuries of the shoulder joint, or of periarticular wounds necessitating operations at the articulation, have been somewhat fully discussed, and it seems proper, after adducing such a mass of evidence, to sum up the principal conclusions indicated by the facts, and to advert to the practical reflections on this subject of experienced military surgeons. The cases were analyzed under three heads: Those treated by expectant conservative measures, those in which excision was practised, and those in which recourse was had to ablation of the limb, and the facts will be reviewed in the same order.

In seventy-two instances, in which it was believed, from the escape of synovia and other symptoms, that shot penetration of the shoulder joint existed without injury of the osseous tissue, expectant treatment was pursued, and but six cases, or 8.33 per cent., terminated fatally, a result that assuredly justifies the repetition of such conservative attempts in all similar cases.

Of five hundred and five patients with shot wounds of the shoulder attended by fracture of some portion of the articulation, treated on the expectant plan, one hundred and thirty-nine, or 27.5 per cent., died. In many of these cases, free incisions were made into the joint, and detached fragments or exfoliations were removed, and occasionally carious surfaces were gouged away. With few exceptions, the cases appear to have been judiciously selected for the expectant plan, and, although the rate of mortality was greater than that of primary amputations at the shoulder, it was decidedly less than that of primary decapitations of the humerus. But it is, of course, to be taken into account, in instituting any comparison between the results of expectant and operative measures, that the cases treated in the early stage by expectation, in which compulsory ulterior operations are practised, and in which the ratio of fatality is disproportionately great, are subtracted from the former and added to the latter category. But it is absurd to attempt to decide this question purely from numerical data.[1] The importance of the arm is so great, and even a limited use of it is so valuable, that, as Guthrie declares,[2] it is justifiable to hazard much to save it when there is a tolerably fair prospect of success. Dr. Neudörfer, a very reliable writer,[3] with opinions formed from a vast personal experience, is another earnest advocate of expectant measures in this class of cases.

[1] Poncet (F.) (*Contribution à la relation méd. de la guerre de* 1870–'71, *Hôpital mil. de Strassbourg*, in *Montpellier Médical*, Dec., 1871—Mars, 1872) inquires: "Is it better to amputate or to attempt conservation? Truly we cannot comprehend why that question is propounded, or why it should be sought to solve it by commentary on statistics. Far better would it be to enquire what are the hygienic conditions, what the power of vital resistance of each patient. Each day these conditions vary with the overcrowding of the wards, with meteorological conditions, with the regimen of the patients, and the moral condition of those subjected to operations. Looking solely at the number of survivors and dead, and seeking, when remote from the facts, to establish by a comparative arithmetical computation the line of conduct of the surgeon, is, if we may be believed, to expose ourselves to conclusions that bear no truthful relation (*sans aucun rapport de vérité*) to the question. It suffices, to prove this, to take the purely numerical results laboriously and conscientiously collected by Dr. Chenu, and then to review under what conditions it has been sought to reduce rules for surgery. We beg those who would themselves, without prejudice, re-analyze this work, to take special account of the columns 'undetermined wounds or those without precise indications,' so often neglected in statistical works. They suffice, nevertheless, to change the proportions of the results."

[2] Guthrie (G. J.), *A Treatise on Gunshot Wounds*, London, 3d ed., 1827, p. 421.

[3] Neudörfer (J.) (*Handbuch der Kriegschirurgie*, 1872, Zweite Hälfte, S. 1145) remarks: "One who performs immediate resection is not at all to be censured, but such a resection is not indicated, that is, indispensably, in a scientific point of view. We at least, and our followers, would, in such cases, prefer to extract the loose fragments, and to secure free admission of air to the capsule of the joint by means of insertion of an appropriate siphon."

Of one thousand and eighty-six patients subjected to excisions at the shoulder, completed histories are wanting in one hundred and thirty-five instances,—nine on the Union, and one hundred and twenty-six on the Confederate returns. The results of eight hundred and seventy-six[1] determined cases are analyzed in detail on page 599, and the results of the seventy-five completed cases from the Confederate reports are summed up on page 606. The operations are arranged in groups, comprising true excisions of the scapulo-humeral articulation, portions of the scapula or clavicle having been removed with the head of the humerus,—partial excisions of the head of the humerus,—decapitations of the humerus,—excisions of the head and part of the shaft of the humerus. The first group, of forty-two cases, is illustrated by the details of six instances, a plate and three wood-cuts of specimens, and three cuts of photographs of cases of recovery. Of the second group, of fourteen cases, two are related in detail, with two cuts of recovered patients, and two of pathological specimens. The numerous decapitations are subdivided into primary, intermediary, and secondary operations, and those of unknown date, and further separated into groups of successful and unsuccessful cases. They are illustrated by three plates and three wood-cuts of recovered patients, seven wood-cuts of specimens, and twenty-two detailed abstracts. The fourth group, comprising five hundred and seventeen cases, similarly divided as to stages of operation and results, is illustrated by twenty-seven pictures of patients after recovery, twenty-six cuts of pathological specimens, and narratives of sixty-six cases.

Of the nine hundred and fifty-one determined cases, three hundred and forty-eight terminated fatally, or 36.6 per cent. Recourse was had to amputation at the shoulder after only fourteen of the operations of excision. One hundred and forty-six operations on Confederate soldiers appear on the Union returns, and two hundred and one on the annexed TABLE XL, or three hundred and forty-seven cases. Of the seven hundred and thirty-nine Union soldiers subjected to this operation, four hundred and seventy-six survived. Of these, the names of three hundred and eighty are now (July, 1875) borne on the Pension Roll. It may be assumed that the medical examiners of the Pension Office, who have inspected these pensioners biennially, have usually represented the disabilities of the limbs in as grave a light as may be compatible with the facts observed, in order that the mutilated men may enjoy the largest rates of pension allowed by the laws.[2] The return "arm totally useless," is not infrequent in cases where the forearm and hand retain their functions in their integrity.[3] Dr. Thomas B. Hood, the medical referee of the Pension Commissioner, informs the writer that it is contemplated by the Bureau to institute an enquiry into the exact condition of the limbs that have undergone excisions. When this is done, precise statements on the subject will be practicable. After carefully analyzing the reports of the pension examiners, and comparing a large number of personal observations on pensioners visiting the Army Medical Museum, and special reports from numerous correspondents, I am convinced that the average extent of usefulness of the limb retained after excisions at the shoulder for injury is not overstated in the paragraph on that subject on page 611.

[1] It has been shown, on page 600, that the mortality of the eight hundred and seventy-six determined cases of excision on the Union reports was but 34.8 per cent. The rate is increased by the addition of the seventy-five completed cases from the Confederate return, with a high ratio of mortality, which would almost certainly have been reduced, could the results of the remainder of the cases in the series of two hundred and one have been ascertained.

[2] It is not, by any means, intended to imply that the duties of the Pension Examining Boards and of individual examiners are not faithfully performed, but the brief reports of disability total (or partial), of the first (or second, or third) grade, are unintelligible to any but those familiar with the complex system of pension laws, endlessly modified by successive enactments. Most of the pensioners were laboring men prior to enlistment, and, as the examiners invariably enquire into the avocations of applicants, a limb may be reported as "absolutely useless" for hard manual labor, when, for clerical or many mechanical tasks, it may be eminently useful.

[3] The reports of the pension examiners in this class of cases may be summarized as follows: "Slight," or "partial," or "impaired," use of arm, 146, useful, 4; entire loss of motion, 5; equal to loss of arm 31, equal to loss of hand, 24; useless, 131; disability not stated in 39 cases.

The amount of after-mobility in the limb appears to depend greatly upon the extent to which the nerve trunks and muscular attachments have been respected by the missile and by the knife, and upon the precautions taken in the after treatment. Dr. O. Heyfelder divides the results as to mobility in recoveries from excision at the shoulder into four categories: *a*, The arm hangs powerless by the side, incapable of active movement, but susceptible of being moved by the sound arm. But the pendulous limb can raise considerable weights, and, when the elbow is supported, the functions of the forearm and hand may be perfect. These cases are not uncommon where a large portion of the shaft has been removed together with the head, and the muscles have atrophied through lesion of the nerves or from disease. The nerve-lesions appear to be irremediable; but much may be done, even at a late period, to relieve what Professor B. von Langenbeck terms "inactivity-paralysis."[1] The absence of mobility in the upper arm after operations extending to a large portion of the diaphysis, as has been proved by numerous examples.[2] The important precautions appear to be to divide the muscular insertions as near the bone as practicable, to guard against injury of the long head of the biceps, to support the elbow and bring the upper end of the diaphysis near the glenoid cavity, that the divided muscles and aponeuroses may become re-attached as high up as possible, and, lastly, to persevere in passive movements from the earliest moment at which they may be safely begun. Unless the nutrition of the limb is impaired by lesions of the vessels or nerves, by resolutely stimulating the muscular contractility by frictions and exercise, the patient regains control over the movements of the upper arm to a remarkable extent.[3] *b*, Dr. O. Heyfelder's[4] second category comprises those cases in which a new scapulo-humeral articulation is formed and the mobility and other functions of the arm are restored. A ginglymoid takes the place of an arthrodial joint, the action of the rotator and abductor muscles being greatly impaired or abolished, while the flexors and extensors acquire a compensatory power. This favorable result is happily the most frequent, and obtains, according to Dr. Heyfelder, in fully one-half of the survivors of excision at the shoulder. In the sense in which the term ginglymoid articulation is here used, I am satisfied that this statement, if applied to the survivors of excision at the shoulder in the American war, would not be exaggerated. A true new articulation with a synovial membrane and ligaments was rarely, if ever, formed; but in a larger proportion than one-half some control over the movements of the upper arm was retained, and often very perfect power of flexion, extension, and adduction. *c*, The third category comprises cases in which there is restricted mobility after the removal of the head with a very large extent of the shaft; and the fourth, *d*, includes the cases of absolute immobility, arising from paralysis from nerve injury, from prolonged disuse of the arm, or from bony anchylosis.

---

[1] LANGENBECK (B. v.), *Chir. Beobachtungen aus dem Kriege*, 1874, p. 143, observes: "By the preceding observations I believe to have proven that 'lame members' from resection of the head of the humerus are nothing but art products of a deficient after treatment, owing especially to the indolence of the wounded, to the vicissitudes of war, and to the fact that, on account of the necessity of dispersing the wounded, the surgeon's supervision is frequently interrupted. The great difference between the inactivity-paralysis and mutilation of the nerves may be recognized by the fact that the former readily yields to proper stimulating and gymnastic treatment, while the latter, as a rule, cannot be cured in any way."

[2] In the case of Reardon, detailed on page 552 (CASE 1529), in which fully six inches of the humerus was removed, and a half-inch ring of bone subsequently exfoliated from the sawn extremity of the shaft, although there has been no regeneration of bone, entire control of the movements permitted by the ginglymoid articulation that has formed are practicable. The deltoid and biceps are as fully developed as on the opposite side. The pensioner can place his hand on the top of his head, and execute all the movements of the upper arm except abduction. Even when a still larger portion of the shaft or even the entire humerus was removed, a certain amount of mobility of the upper arm was attained by encasing it in an apparatus, a sort of exo-skeleton, as in the cases of Cleghorn, p. 568, Kegerries, p. 594, Wolff, p. 573, and Woods, p. 580.

[3] In the case of Lieutenant H. G. Jacobs (p. 553), the control of the movements of the arm was far greater in 1875, nearly twelve years after the operation, than ten years before. There was considerable power of abduction even, the arthrodial character of the articulation being preserved. There are many like instances that have come under my own observation.

[4] HEYFELDER (O.), *Lehrbuch der Resectionen*, Wien, 1863, *Nachbehandlung der Resection des Schultergelenkes*, S. 221

True bony anchylosis appears to have rarely resulted among the survivors of excision for injury that have been kept under observation. It is true that it is stated that this condition exists in twenty cases;[1] but, in most of these, the stiffness of the joint was apparently only partial, was, in fact, false or spurious anchylosis. This conforms to the experience of Dr. Esmarch in Schleswig-Holstein, and to observations after other wars,[2] and might be anticipated from the structure and latitude of movement permitted by the shoulder joint. True bony anchylosis after either disease or injury is of rare occurrence. There are but two examples in the Army Medical Museum,[3] and Dr. Hodges states that, in 1855, the museums in London and Paris possessed but four specimens illustrating such a condition. Dr. Albrecht Wagner declared, in 1853, that "ankylosis after resection of the shoulder joint has not been observed up to the present time."[4]

The reports justify the conclusion of Dr. Richard M. Hodges, that "comparatively rapid recovery follows excision for injury." Brigadier General E. B. Brown, U. S. V. (CASE 1495, page 522), used the forearm and hand freely three weeks after the operation, and guided his horse with the mutilated arm five weeks after a shot fracture of the head of the humerus with division of the long head of the biceps. There were many other instances in which officers and non-commissioned officers returned to duty, and privates to modified duty, within six months from the date of injury.[5]

Complete regeneration of the portion of bone excised was not observed in any instance, and partial regeneration to any appreciable extent was extremely rare. Subperiosteal excisions were seldom attempted, probably never after the systematic method adopted by Dr. Ollier[6] and Professor v. Langenbeck,[7] and such results as are reported by

[7] LANGENBECK (B. v.) (*Chir. Beob. aus dem Kriege*, Berlin, 1874, S. 140) relates that: "Lieut. v. Röll, 35th Infantry, was wounded at Mars le Tour, August 16, 1870, by a Chassepôt ball, which passed through the upper third of the right humerus. He was taken to the residence of Dr. Petebgand, at Gorze. On August 26th, seven pieces of bone were removed through the wound of entrance. On Sept. 14th, pyæmic symptoms appeared. September 16th, the head of the bone and portions of the shaft were excised, with complete preservation of the muscles of the scapula in conjunction with the carefully separated periosteum. In October, 1870, the patient was transferred to Berlin, under charge of Dr. GRŒTHUYSON, who had assisted Dr. LANGENBECK in the treatment at Gorze. During the journey, it became necessary to make several incisions into the lower part of the arm to allow the escape of pus. Lieutenant v. Röll was admitted to the "*Königin Augusta*" Hospital at Berlin, in charge of Professor Dr. SCHÖNBORN. It soon became evident that the elbow joint was involved. About the end of November, Dr. SCHÖNBORN resected the elbow joint, and at the same time extracted the remaining epiphysis of the humerus, which had become necrosed. Dr. LANGENBECK continues: "In the fall of 1871, I saw v. Röll in Berlin. The entire upper arm bone is completely regenerated, and forms a really strong bony shaft. The elbow joint is so perfect in form and function that you are compelled to inspect the plainly visible resection-cicatrix to convince yourself that the elbow joint has really been removed. Hand and forearm are capable of all motions and functions. * * In November, 1871, v. Röll, from a severe fall on the street, suffered a transverse fracture of the newly-formed humerus just above the elbow. I immediately applied a gypsum bandage, which remained five weeks. On its removal the fracture had completely united. Similar accidents recurred in the spring of 1872 three times, the new bone being fractured in a different place each time—in the middle, at the end of the upper third, and at the beginning of the upper third, just below the new head of the humerus. Recovery ensued, the gypsum bandage being applied as before. In consequence of the arm being fixed continually, until the spring of 1872, in gypsum bandages, its use had been entirely lost. * * On May 24, 1873, six weeks after the removal of the last gypsum bandage, a careful examination gave the following result: the entire right extremity

these surgeons, do not appear to have been achieved; nor was the scooping out of the diseased head of the humerus, the *évidement des os*, commended by M. Sédillot,[1] resorted to in any reported instance. It is true that in the accounts of a few of the operations it is stated that care was taken to preserve as much of the periosteum as possible; but these were almost all instances of early excisions, in which the methodical separation of the periosteum is a very different task from its removal when inflamed and thickened and ready to peel away on the application of a slight force. The reported instances of partial restoration of bone are enumerated below.[2]

There were a few examples among the early fatal cases of detailed reports of the necroscopic appearances, no attempts at reparation having been observed.[3] In the infrequent instances of deaths at remote periods after the operation, the valuable opportunities for ascertaining the conditions of the parts appear to have been neglected,[4] which is the more to be regretted as science possesses so few precise facts on this subject.[5]

I have nothing further to add to the remarks that have been made on the mode of performing excision at the shoulder for injury, save that there is a tendency toward unanimity in accepting the single straight anterior incision, commended by Professor v. Langenbeck, as the best procedure, and that the position of the shot openings need not be much regarded.[6]

The results of the treatment of shot injuries of the shoulder by amputation at the joint have been so recently recapitulated, on page 655, that it is unnecessary to review them here, except for purposes of statistical comparison with the results obtained on other occasions.

Of the twenty-three hundred and sixty-nine *determined cases* referred to in the preceding tables, five hundred and seventy-seven (577) were treated by expectancy, with a mortality of 25.1 per cent.; nine hundred and fifty-one (951) by excision, with a mortality of 36.6 per cent.; eight hundred and forty-one (841) by amputation, with a mortality of 29.1 per cent.,—in all, seven hundred and thirty eight cases terminating fatally, or 31.1 per

appears a little smaller, probably because it had participated little, since August, 1870, in the progressive development of the skeleton. Especially noticeable is the smallness of the right scapula in all dimensions as compared with the left scapula. Less observable is this backwardness in the growth of the rest of the extremity, and the right forearm and hand appear even more strongly developed than the left. The right upper arm from the end of the acromion to the external condyle is nearly four centimeters shorter than the left, and its muscular development is inferior; the new bone is a little thinner, and the places of the four fractures are observable. * * The active mobility of the arm forward and backward is quite extensive. Patient carries the hand to the mouth, uses it for eating, for buckling his cravat; carries it to the back, etc."

[1] SÉDILLOT (CH.), *De l'évidement sous-periosté des os*, 1860. 2me éd., Paris, 1867, and *Traité de médecine opératione*, Paris, 3me éd., 1865, T. I. p. 474.

[2] In CASE 1503, p. 529, Surgeon J. J. KNOTT, P. A. C. S., enclosed a letter from the patient, stating that there "was a mere gristle attaching itself to the shoulder and to the end of the bone about five inches down the arm." In CASE 1534, p. 562, Surgeon G. C. HARLAN, 11th Pennsylvania Cavalry, reported that "two and a half inches of new bone have been formed," five years after the operation. In CASE 1575, p. 589, Surgeon R. B. BONTECOU, U. S. V., reported that "a new shaft had supplied the part of the bone removed," this a few months after the injury. In the case of D. Gravel (TABLE XXXV, No. 13), the Examining Board at Detroit reported, nine years after the operation, "the bone has been reproduced."

[3] In CASE 1584, p. 596, Professor JOSEPH LEIDY examined the shoulder of a man who died thirteen days after an excision of the upper extremity of the left humerus, for a shot injury received eleven months previously, and found "no restoration of bone." Assistant Surgeon J. S. BILLINGS, U. S. A., examined, five days after the operation, a fatal case of intermediary excision at the right shoulder and discovered "no attempt at repair in the wound."

[4] Among the five hundred and fifty-one survivors of this operation, twenty-five pensioners are known to have died at periods remote from the operations; but no account of an autopsy having been made is recorded in any instance.

[5] Dr. A. WAGNER (*On the Process of Repair after Résection and Extirpation of Bones.* HOLMES'S *Trans. New Syd. Soc.*, 1859, p. 119) informs us that he was able to find (in the year 1853) but five "examples of dissection of the human body after resection of the head of the humerus. Three of these belong to TEXTOR and two to SYME. (HUMMEL, *Ueber die Resection im Oberarmgelenk*, Würtzburg, 1832; TEXTOR (C.), *Neuer Chiron.*, Thl. I, Stck I, 3; TEXTOR (C.), *Ueber die Wiedererzeugung der Knochen nach Resection bei Menschen*, Würtzburg, 1843, S. 11; SYME (J.), *Treatise on the Excision of Diseased Joints*, Edinburgh, 1831, pp. 51, 58; *Contributions to Practical Surgery*, Edinburgh, 1848, p. 97.) The patients had survived the operation six months, six, ten, eleven, and nineteen years, respectively. The usefulness of the arm had been very great in all of them. * * SYME found in both of his patients,—who had died, one six months, the other ten years, after the operation,—the head of the humerus rounded off and united by a firm ligamentous tissue to the shoulder blade. TEXTOR, however, gives expressly two cases, six and eleven years after the operation, of formation of bone, which in the first appeared as a bony styloid prominence, resembling the styloid process of the ulna, directed upward, and in the second covered the upper end of the humerus, in the form of an uneven tubercular mass, about half an inch long." In the latter case, and in that of a patient who died nineteen years after the operation, TEXTOR found a meniscus-shaped, moveable, fibro-cartilaginous formation between the upper extremity of the bone and the glenoid cavity. In one only of the five cases, a new articular capsule appeared to have formed.

[6] MAYER (L.) (*Kriegschir. Mittheilungen*, in *Deutsche Zeitschrift für Chir.*, 1873, B. III, S. 70) says: "I agree with Socin, that the surgeon should not allow himself to be induced, by the location of the wound openings, to modify the position and direction of the incision of LANGENBECK'S method."

cent.[1] Let us compare these results with those of other wars of the last half century, when excision as well as expectation and amputation became a common alternative:

Of the aggregate of 1184[6] cases about one-seventh were treated by expectant measures, with a mortality of 49.7 per cent.; one third by excision, with a mortality of 42.0 per cent.; and over one-half by exarticulation, with a mortality of 54.8 per cent. The death rate of the whole number of determined cases is 50.0 per cent.

[1] A total of twenty-three hundred and twenty-eight cases of shot injury at the shoulder are spoken of at the commencement of this Section. The scapulo-humeral articulation was believed to be primarily implicated in fourteen hundred of these, and involved consecutively, either by disease or operation, or both, in nine hundred and twenty-eight. To the twenty-three hundred and twenty-eight cases were added two hundred and one Confederate cases of excision, and fourteen scapulo-humeral amputations for complications of flesh wounds (from Section I. p. 468), or a total of twenty-five hundred and twenty-nine cases (2,529). Of these, nine excisions, twenty-five amputations, and one hundred and twenty-six of the added Confederate cases, or one hundred and sixty cases, were undetermined, leaving twenty-three hundred and sixty-nine (2,369) determined cases for analysis.

[6] It would be easy to swell this statement by citing cases from earlier authors, such as those adduced in notes on pages 608 and 613, but these are frequently returns of successful cases only, and it seems fairer to quote those statistics professing some claim to completeness.

The high rate of fatality exhibited in TABLE LIII is mainly due to the excessive losses presented in most of the French reports. Whether these lamentable results are traceable to unfavorable hygienic conditions in the French military hospitals, managed by intendants,—as M. Sédillot believes,—to inferior power of vital resistance in the French soldiery, or to persistence in depletory measures in the after-treatment of operations,—as some critics aver,—the fact is certain that there is a startling disparity between the results of major operations as reported by French surgeons and those reported by the surgeons of Great Britain, Germany, and the United States.

Although Hutin had set a good example in recording the remote results of injuries in the inmates of the *Hôtel des Invalides*, and D. J. Larrey and Dupuytren bestowed much attention on the ulterior effects of surgical mutilations, no systematic census of the condition of the survivors of the wounds and injuries of war has, until recently, been attempted. The English returns of the Crimean and Indian pensioners were fragmentary. In M. Chenu's Crimean and Italian narratives, the cases were dropped as soon as pensioned. Until I met Professor Hannover's work on the Danish invalids of the war of 1864, I thought that the initiative in this difficult task had been undertaken by this Office. The path opened by Professor Hannover has been further explored, and the appended table presents a limited number of facts on the subject collected by German and English authors:

TABLE LIV.

Tabular Statement of One Hundred and Fifty Invalid Pensioners recovered from Shot Injuries implicating the Shoulder Joint, and treated either by Expectation, Excision, or Amputation.

	37	97	16	150

It will be observed that the number of invalids surviving excision largely predominates over the combined numbers of those recovering after expectant treatment and amputation; and, when compared with the scanty records that have come down to us of the pension asylums in the early part of the century, this and the preceding table indicate a

great diminution in the frequency of recourse to exarticulation for shot injuries of the shoulder. It has been claimed by Professors Hannover, v. Langenbeck,[1] and others, that the ulterior results are better after successful expectant treatment than after excisions at the shoulder. At page 505 *et seq.* many examples are adduced that lead some of our surgeons to share in this view. This may be conceded without detracting from the inestimable value of excisions at the shoulder,[2] which finds its application in cases in which expectant measures are utterly inadmissible.[3] Professor Hannover is undoubtedly in error in contending that remote amelioration after excisions for injury rarely or never occurs. I have under personal observation more than a score of pensioners in whom progressive improvement has continued for ten or twelve years after excision at the shoulder for shot fracture; and in several of them all the functions of the upper arm except abduction have become nearly perfect. Indeed, the testimony on this point is cumulative,[4] and will doubtless be fully put in evidence in an exhaustive treatise on the subject, now in preparation by Professor Gurlt, of the University of Berlin.[5]

A pamphlet on excisions, circulated during the war for the instruction of medical officers in the field,[6] contains the precept that "excisions of the larger joints should never be practised on the battle-field." I must utterly dissent from this dictum of the distinguished authors, and further demur to the assertion that "statistics show that secondary

[1] LANGENBECK (B. v.) (*Chirurgische Beobachtungen aus dem Kriege*, Berlin, 1874, S. 114) observes: "In regard to the value of the resection of the shoulder joint, as compared with the expectant mode of treatment, surgeons, who have examined invalid pensioners, generally arrive at the conclusion that better results are obtained by the conservative mode of treatment than by resection." HANNOVER (A.) (*Die Dänischen Invaliden aus dem Kriege, 1864*, Berlin, 1870, S. 35) remarks: "Among our men, we have never seen amelioration at a remote period [after excision]. Their condition either remained unchanged, or deteriorated in a high degree; so that the resected arm proved to the invalid a burthen and a hindrance. Whether this unfortunate result was due to the improper selection of subjects and modes of operation or to the after-treatment is difficult to decide. Evidently the conditions are different in shot wounds and in chronic disease." Dr. LOEFFLER, on the other hand, is a staunch advocate of the superior end-results of excisions (*Langenbeck's Archiv fur Klinische Chirurgie*, 1871, B. XII, S. 319), and seeks to controvert Professor HANNOVER'S statements.

[2] LANGENBECK (B. v.) (*Chirurgische Beobachtungen aus dem Kriege*, Berlin, 1874, S. 156) sums up his conclusions regarding the comparative value and indications of treatment by expectation, excision, or amputation, in shot injuries at the shoulder, as follows: "1. All less severe shot injuries of the shoulder joint justify the attempt at expectant treatment, under the presumption that in many of these cases secondary resection will become necessary. 2. All extensive shot fractures of the shoulder joint indicate primary resection. 3. Crushing of the shoulder joint with laceration of the soft parts does not, of itself, indicate exarticulation, but secondary resection. 4. The aim of the conservative treatment is to avoid anchylosis, to restore mobility to the joint. 5. Anchylosis at the shoulder joint having supervened, the usefulness of the arm may be improved by secondary resection of the head of the humerus. 6. The formation of a new shoulder joint with voluntary motion will be most readily secured by subperiosteal resection. 7. After subperiosteal resection the most careful after-treatment is required to restore useful joints. 8. A gradually increasing deterioration, through increasing atrophy of muscles, does not occur after resection of the head of the humerus. The so-called *lähmungsartige Zustand* (lame-like condition) is nothing but paralysis from inaction. 9. The paralysis caused by want of exercise can be removed by appropriate treatment even a long time after resection, and the usefulness of the extremity may afterward be re-established." SCHÜLLER (M.) (*Kriegschir Skizzen aus dem deutsch-französischen Kriege*, 1870–'71, Hannover, 1871, S. 38) remarks: "In shot wounds of the shoulder joint generally resection is preferable to expectant treatment. By the removal of the voluminous head the suppuration is considerably diminished, in the first place because the suppurating surface is contracted, and, in the second place, the patient escapes the tedious process of eliminating the necrosed fragments."

[3] BILLROTH (TH.) (*Chirurgische Briefe aus den Kriegslazarethen*, u. s. w., Berlin, 1872, S. 217) says: "We would undoubtedly be justified, from the end-results of the shoulder excision, to ponder the question whether this operation might not be more frequently avoided. For my own part, I have learned to value the life-saving results of this operation yet higher, and find that we cannot sufficiently thank the men who introduced this procedure into the surgery of war."

[4] Even Dr. NEUDÖRFER, who is an advocate of deferred or secondary excisions for injury, in a paper he has had the kindness to send me (*Die End-resultate der Gelenkresectionen*, extracted from the *Wiener Medizische Presse*, 1871), concedes the amelioration of the functions of the arm after excisions at the shoulder. "What," he enquires, "are the results of favorably ending joint-suppurations under the expectant conservative treatment? The question may be in general answered that traumatic suppuration of the joint, as well as that from pathological causes, is only very rarely cured with complete motion of the joint. If, therefore, resection is indicated, it is justifiable in all cases where suppuration threatens the life of the patient; but the peril, the jeopardy to life must have begun, the suppuration of the joint in itself not necessarily imperilling life." This position will be regarded by many as untenable; but, on the point at issue, Dr. NEUDÖRFER, after citing a case of shoulder excision for shot injury, adds: "Yet to-day, *ten years later*, the result is the same as early after recovery, indeed the present condition is even better than then, as, at the last examination, I found that sensation in the parts to which the ulnar nerve is distributed was partially restored."

[5] Professor GURLT writes me, May 5, 1874: "I am occupied in making up the history and statistics of all the resections of joints that have been made *for gunshot wounds* since the wars at the end of the last century. My purpose is not only to elucidate some points in the history of these operations that have been partially forgotten, but principally to point out *the ultimate results* of these resections many years after their execution, a subject almost unexplored till now. Almost all the publications on this subject have been made up a short time subsequently, the results being recorded a year or two later than the operation, and when the restoration of the functions of the limb was incomplete. Thus it was that the publication of Professor Hannover, of Copenhagen, on the miserable state of the Danish invalids, excised by Prussian surgeons in the Dano-Prussian war of 1864, produced a painful impression, which was by no means lowered by the observations printed after the Franco-German war regarding the condition of the invalids who had undergone resection. Fortunately, we now know that *the results have greatly improved after the limbs have been for some years in constant use.* This I intend to prove by as many examples as possible, derived from all available sources. I have been enabled to collect information of the ultimate results and present condition of invalids with joint resections, in the Schleswig-Holstein campaigns (24–26 years ago), of the Dano-German war of 1864, and some others . . ."

[6] *A Report on the Subject of Excision of Joints for Traumatic Cause*, by Drs. HAYWARD, TOWNSEND, WARE, J. M. WARREN, CABOT, DALE, and HODGES, Cambridge, 1862.

excisions are more successful than primary in the proportion of 17 to 10," as unfounded on reliable data, and in flagrant contradiction with the real facts. I regard the recommendation of deferred operations as pernicious, and believe that, in the light of our present experience, it will never gain a foothold among military surgeons.

In regard to *partial* excisions of the head of the humerus, important evidence has been presented (p. 526–8) in confirmation of that precept of Baudens: *En principe il faut limiter la résection à la lésion et respecter le plus possible le tissu osseux.* The late Medical Director Hewit and Drs. Bontecou, B. Howard, Armsby, and W. Thomson especially advocated and exemplified the utility, under some circumstances, of partial excisions of the epiphysis.[1]

In 1862, excision at the shoulder was practised in the proportion of 2.3 in a thousand cases of shot injuries returned; in 1863, in 3.4 per thousand; in 1864, in 4.4 per thousand; in 1865, in 4. per thousand.

The facts that have been adduced in this Section appear fully to warrant the conclusions—1. That in slight shot injuries of the shoulder joint an expectant conservative treatment is justifiable.[2] 2. If a ball is impacted in the head of the bone, or if the epiphysis is much comminuted, unless there is injury to the blood-vessels and nerves, or very grave injury of the other soft parts, primary excision should be practised. 3. Concomitant fractures of the acromial end of the clavicle, or of the neck or processes of the scapula, or of the upper third of the shaft of the humerus, do not necessarily contraindicate excisions at the shoulder.[3] 4. Intermediary excisions should seldom or never be practised. If, in an attempt at expectant conservative treatment, intense suppurative inflammation arises, it should be combated by free incisions, drainage, emollient applications, etc., and every endeavor should be made to avoid inflicting another wound upon the inflamed medullary tissue, and to await the secondary stage, before undertaking operative interference.[4] 5. The after-treatment of securing comparative immobility and support of the limb and efficient drainage of the wound; and the ulterior after-treatment of judicious passive and active movements of the arm, are of essential importance in restoring the functions of the member. 6. Primary

[1] BAUDENS (O.) (*Comptes-rendus de l'Académie des Sciences*, Paris, Fevrier 26, 1855, and *Recueil de Mem. de Méd. Mil.*, 2ème sér., T. XV, p. 180) says: "D'après ce principe il nous est arrivé de n'extraire que la moitié de la tête de l'humérus, ce qui n'avait jamais été fait encore, que nous sachions." HEWIT (H. S.) (*Appendix to Part I of Med. and Surg. Hist. of War of the Rebellion*, 1870, p. 312) remarks: "Partial excisions of the head of the humerus is a safe and successful operation. * * Scapular motion makes great compensation for anchylosis, and it is frequently better to accept this result, rather than to incur the risk to life of the more brilliant procedure of complete excision." See also PINKNEY (N.), *Am. Jour. Med. Sci.*, 1846, Vol. XII, p. 330.

[2] GEISSEL (R.) (*Kriegschirurgische Reminiscenzen von* 1870 *bis* 1871, in *Deutsche Zeitschrift für Chirurgie*, B. V, 1874–5, S. 36) remarks: "With VON LANGENBECK, I believe in accepting, as a practical rule, that all slight injuries of the shoulder joint * * justify the attempt at conservative surgery, with an anticipation of intermediary or secondary resection if necessary; but *all extensive shot fractures indicate primary resection.* If an expectative treatment has been resolved upon, under all circumstances an active mobile joint should be aimed at by early gymnastic exercise. Should, nevertheless, anchylosis supervene, the attempt may be made to obtain an active mobile joint by resection." Dr. GEISSEL relates the case of P. Dorweiber, wounded at Gravelotte, August 18, 1870; resection of head and three inches of diaphysis three days afterward. This man was examined four years afterward. No new bone-formation was found, but Dr. GEISSEL thinks the case confirms the opinion given by VON LANGENBECK, that results once achieved after resection of the joints will not be subsequently lost under judicious active after-treatment, and controverts the opinion of HANNOVER, of Copenhagen, that the end-results of joint resections deteriorate from year to year." The italics are by the editor.

[3] As this sheet is going to press, I have received an interesting monograph (*Die Resultate der Gelenkresectionen im Kriege*, Giessen, 1874) by Dr. E. BERGMANN, professor of surgery at Dorpat, and one of the surgeons of the great military hospitals at Carlsruhe and Mannheim during the war of 1870–'71. He fully describes 15 intermediary and secondary excisions at the shoulder, with 12 recoveries. These and other successful resections are beautifully illustrated by Albertotype plates. Active mobility of the joint "in all directions" was achieved in one case, the patient declaring that he "could lift the arm upward to the top of the head, sideward to the top of the shoulder, and revolve the arm in a circle, without pain." In another case (Fall 23, S. 18, B. Geng, 6th Bavarian Infantry, wounded at Etival, by shell, October 6, 1870), part of the scapula was removed on the third, and the head and part of shaft of humerus on the thirteenth day. "All the soft parts on the outer posterior arm, with a portion of the acromion and spine of scapula, were so completely torn away that the fractured acromial process and the fissured head of the humerus were plainly visible. Abscesses formed in the course of the treatment, * * and even gangrene supervened. Nevertheless, a result was obtained that leaves nothing to be desired. The muscles are splendidly restored, as is shown in Plates IX and X. * * Since Langenbeck, in 1866, saved, by resection, the arm of ———, in a case where all the surrounding parts, with the exception of the large vessels and nerves and the triceps and latissimus muscles, were torn away, and even enabled the patient to re-enter the military service, to ride horseback, and carry the sword with the right (the resected) arm, this case is the most notable example that shot fracture of the shoulder joint with extensive laceration of the soft parts does not indicate primary amputation."

[4] In all three stages, statistics of large aggregates teach that the risk of excision at the shoulder is a little in excess of ablation of the limb at the joint. Thus, in our experience, the fatality of excisions was P, 31.06, I. 46.4, S. 29.3; of amputations, P. 24.1, I. 45.8, S. 28.7. M. CHENU (*Aperçu hist.*, etc., Paris, 1874, T. I, p. 492) reports 325 exarticulations at the shoulder with 207 deaths, or 63.69 per cent., and 819 excisions with 226 or 70.85 per cent.

exarticulation of the arm at the shoulder is imperative in cases of shot lesions of the upper extremity of the humerus attended by injury of the axillary vessels and nerves, or by very grave injuries of the other soft parts in the vicinity of the joint; and may also be demanded when fractures of the humerus involving the shoulder are conjoined with severe injuries lower down in the limb. Circumstances may also justify primary ablation of the arm when there is little injury to the soft parts and the epiphysis is untouched, if the humerus be so extensively shattered downward as to forbid excision, and fissures extend so near the joint that section of the bone in its continuity cannot be practised without danger of arthritis. Intermediary exarticulation at the shoulder may be required in cases of hæmorrhage, gangrene, or osteomyelitis; and secondary exarticulations for the same causes, and also for complete necrosis of the humerus.

Section IV.

INJURIES OF THE SHAFT OF THE HUMERUS.

It is proposed to consider in this place only injuries inflicted by weapons of war, and to relegate the instances of simple and compound fracture, produced by other causes, to the Chapter specially devoted to those subjects, in the *Third Surgical Volume*. As there were no reported instances of sword or bayonet injuries of the humerus, the Section will be wholly occupied by discussions of the reports of shot fractures of the shaft involving neither joint, and of the operations performed in the continuity of the upper arm. In a statistical point of view, the classification will often seem arbitrary, and the estimates cannot be otherwise than approximative. The summing up of the injuries and of the operations will not accord. It has been seen, in the last Section, that excisions and amputations at the shoulder joint were not infrequently practised for injuries attended by fractures strictly limited to the diaphyses. In this Section, many examples will appear of amputations through the shaft of the humerus for shot lesions of the elbow joint or of the forearm. This explanation is essential to a just appreciation of the discrepancies in the numerical statements of the shot fractures and operations involving the shaft of the humerus. Although much labor has been expended in the analysis of the cases of this group, their number and complexity is such, that precision in presentation could only be attained at the cost of long and tiresome iterations. At least eight thousand two hundred and forty-five cases are comprised in the category, the shot fractures of the shaft complicated by fractures of the shoulder or elbow joints being excluded. Of this large number, many were attended by flesh or penetrating wounds of the thorax, or by grave, and sometimes by multiple, injuries in other parts of the body. Through tabular statements, an effort is made to indicate the distribution of these instances of multiple injuries, which have been, or will be, referred to elsewhere. The Section is naturally divided into enquiries regarding the nature and extent of the fractures, the operations undertaken, and the complications of the injuries and operations, and will be subdivided into analyses of cases dealt with on the expectant conservative plan, of those treated by excision, and of those subjected to amputation. A general summary will be premised.

TABLE LV.

Tabular Statement of Eighty-two Hundred and Forty-five Shot Fractures of the Shaft of the Humerus unattended by Primary Injury of the Shoulder or Elbow Joints.

SUBDIVISIONS.	Cases.	Duty.	Discharged.	Undetermined.	Died.	Mortality of Determined Cases.
1. Treated by Expectation	3,005	1,055	1,454	45	451	15.2
2. Followed by Amputation at the Shoulder	606	64	370	21	151	25.8
3. Followed by Amputation of Upper Arm	3,685	430	2,223	259	773	22.5
4. Followed by Excision of Head and Portion of Shaft of Humerus	245	28	141	4	72	29.8
5. Followed by Excision of Shaft of Humerus	632	87	353	28	164	27.1
6. Followed by Excision of Portion of Shaft, with the Elbow Joint	8	3	4	0	1	12.5
7. Followed by Excision in the Shaft and Consecutive Amputation at the Shoulder.	15	0	4	0	11	73.3
8. Followed by Excision in the Shaft and Consecutive Amput'n of Arm	49	3	30	0	16	32.6
Aggregates	8,245	1,670	4,579	357	1,639	20.7

The results of three hundred and fifty-seven of these cases could not be traced. Of the seventy-eight hundred and eighty-eight cases with ascertained results, above tabulated, it will be observed that little more than one-fifth terminated fatally; and if the cases complicated by grave injuries of the trunk or lower extremity were eliminated, the percentage of mortality would be yet further reduced. Two hundred and thirty-six cases furnished the Museum with pathological specimens.[1]

Two hundred and forty-five cases, in which excisions of the head or head and upper part of shaft of the humerus were excised, have already been examined, and also six hundred and twenty-one cases treated by scapulo-humeral amputation, leaving somewhat over seven thousand cases for consideration. These will be analyzed in the following order: Cases treated by 1st, expectant conservative measures; 2d, by excisions in the continuity; 3d, by amputations in the shaft.

EXPECTANT CONSERVATIVE MEASURES.—Three thousand and five cases of shot fractures limited to the shaft of the humerus, treated on the expectant conservative plan, are found on the returns. It is probable that many of the cases reported as excisions in the continuity really belong to the category now under consideration; but the indications of the reports have been followed in tabulating the cases. In forty-five instances, it was impracticable to trace the results. Of the remaining twenty-nine hundred and sixty-patients, nearly a third returned to modified duty; nearly half of the whole number were discharged; and somewhat over a seventh, or four hundred and fifty-one, died. The mortality rate is not large; but, obviously, the least severe cases were selected for treatment by expectant measures. The extent of the shot injuries, the varieties they presented in different portions of the shaft, the attendant and consequent complications, the details of treatment, and the causes of fatality will all claim attention.

Shot Contusions and Partial Fractures of the Shaft of the Humerus treated by Expectation.—According to the reports, injuries belonging to either of these groups, unless

[1] These are distributed as follows: Thirty-six specimens, 7 from cases of recovery and 29 from fatal cases treated on the expectant plan; 41 instances, 24 successful and 17 fatal, from amputations at the shoulder; 80 specimens from amputations of the arm, 51 successful, 29 fatal; 37 from excisions of head and part of shaft, 21 successful, 16 fatal; 30 specimens from excisions in the shaft, 19 recoveries, 11 *post-mortem* specimens; 1 specimen from a recovery after an excision of a portion of shaft with the elbow joint; 4 specimens from fatal cases of excisions in the shaft with ulterior amputation at the shoulder; 7 specimens, 4 from successful and 3 from unsuccessful cases of excision in the shaft followed by amputation of the arm.

they resulted favorably and escaped recognition, were exceedingly rare. Unquestionably, opportunities of demonstrating such lesions after death, or after excision or amputation, were very infrequent. The Museum possesses but two examples in the humerus of those illustrations of the effects of shot contusion, characterized by a thin elliptical exfoliation or by a slight superficial caries, associated with signs in the cancellated tissue of suppurative osteomyelitis, of which instances are not uncommon in the femur, tibia, and cranial bones. It may be remarked also that Surgeon John A. Lidell, U. S. V., who made a special study of shot contusions of the long bones, and has published a valuable monograph[1] on the subject, does not adduce a single instance of contusion of the humerus. There are several specimens of missiles in the Museum slightly flattened by impact on the shaft of the humerus, from cases of recovery, where it was supposed that the humerus was contused or at most only partially fractured.[2] It is probable that some cases of necrosis after shot wounds of the upper arm, in which fractures were not discovered at the date of injury, were instances of grazing shots or contusions of the humerus. The following is an example:

CASE 1612.—Corporal A. M. A——, Co. B, 16th Michigan, aged 27 years, was wounded at Poplar Grove Church, September 30, 1864. From a Fifth Corps hospital he was admitted, on October 7th, to Harewood Hospital. Surgeon R. B. Bontecou, U. S. V., recorded: "Gunshot wound of left arm, upper third. Discharged from service March 6, 1865." Examiner J. Nichols, of Washington, D. C., on May 2, 1865, certified: "Gunshot wound of left humerus, with compound fracture; abscesses have formed; limb now greatly swollen and inflamed; flesh wound extensive and yet unhealed; gangrene attacked the wound, destroying a large portion of soft tissue." Dr. D. Stanton, of New Brighton, Pennsylvania, late surgeon U. S. V., on March 15, 1865, forwarded the specimen, represented in the annexed wood-cut (FIG. 500), to the Museum with the following history: "A minié ball passed through the upper third of the left arm and side, grazing the humerus. Hospital gangrene commenced in the wound on October 20th, at Harewood Hospital, which was arrested by the use of bromine, turpentine, &c., after having exposed four inches of the bone. The patient was admitted to the Massachusetts General Hospital, at Boston, in May, and a small scale of bone was removed by Drs. Bigelow and Clarke. He reported to me in Detroit, Michigan, in October, 1865. I made an incision four inches in length, enlarged the sinus in the new bone, broke off about an inch from the upper end of the sequestrum, when I was enabled to remove the remaining portion, three and a half inches in length. At last report (February 5th), the wound had almost healed and the arm was improving rapidly." The pensioner, in his application for increase, on July 9, 1866, states "that his arm is completely disabled, it being impossible to straighten his elbow, and that his shoulder joint is also stiff and he cannot use it." In another application, on October 3, 1871, he states: "The wound is now a running sore; four inches of bone were taken out soon after the reception of the wound, and last year a piece of bone was discharged." Drs. G. K. Johnson and S. R. Wooster, of the Examining Board at Grand Rapids, Michigan, January 3, 1872, certify: "Wounded by a musket ball in upper third of left arm, causing a flesh wound. Gangrene followed, with destruction of soft tissues and death of bone, three and a half inches of shaft of humerus being removed. There is now a slight union by the formation of new bone, with positive evidence of dead bone still remaining, the wound never having been entirely healed. The bone at the place of injury is covered only with skin for a space of three inches, which is adherent to the bone. No muscular or cellular tissue. There is increased disability because of the extent of death of bone, which still continues. Applicant can use his arm a little in feeding and dressing himself," &c. The same Board, with the addition of Drs. Z. E. Bliss and E. Boice, reported, September 12, 1873: "Ball entered upper third of left arm, injuring the bone, and, passing around, wounded back just below posterior border of left axilla. Gangrene followed, with destruction of soft tissues and death of bone. There is now complete continuity in shaft of humerus, with extensive adhesions of skin to bone, and loss of muscular tissue." The disability was rated total, and the pensioner was paid December 4, 1873.

FIG. 500.—Cylindrical sequestrum from shaft of left humerus after necrosis from shot injury. *Spec.* 2434.

Dr. R. B. Bontecou states that he has "observed *several* cases of death from pyæmia resulting from shot contusions of the humerus and the femur, and, in looking over a mass of manuscript, found a history of a case." Dr. Bontecou also contributed to the Museum the beautiful specimens (Nos. 6309, 6312) of shot contusion of the humerus represented

[1] LIDELL (J. A.), *On Contusion and Contused Wounds of Bone, with an Account of Thirteen Cases*, in the *Am. Jour. Med. Sci*, 1865, Vol. L, p. 17.

[2] Namely: *Spec.* 4571, "a wafer-like fragment of a spherical ball extracted after flattening against the left humerus" (*Cat. Surg. Sect.*, 1866, p. 601); case of Pt. J. Stephens, 2d Massachusetts. He was wounded August 9, 1862, at Slaughter's Mountain, and died September 7, 1862, at Annapolis, of pyæmia. *Spec.* 4416, "a buckshot flattened against the humerus without fracture" (*Cat. Surg. Sect.*, 1865, p. 597); case of Pt. J. Franel, 45th Pennsylvania, who recovered without complications. *Spec.* 4124 (see CASE 1514). *Spec.* 455, "a conoidal ball laterally flattened; the side next the bone is comparatively smooth, and retains a fragment of fascia or periosteum" (*Cat. Surg. Sect.*, 1865, p. 615); it was lodged in the middle of the arm without fracturing the humerus. *Spec.* 2751, "a conoidal ball with two portions smoothly cut off the body and base at an obtuse angle to each other" (*Cat. Surg. Sect.*, 1866, p. 616); Pt. C. C. Cole, 39th Massachusetts. This ball was found lying between the brachial and the middle of the right humerus, in contact with the bone, but no apparent fracture was detected.

in PLATE L, opposite. The specimens are from soldiers who died in Harewood Hospital, in 1864, from pyæmia, a few weeks after shot perforations of the right arm by musket balls, which must have grazed the humerus.[1]

We are indebted to the veteran Professor Louis Stromeyer for the first clear account of shot contusions of long bones.[2] Since this form of injury was described by him, it has received much attention from writers on military surgery.[3]

Partial Shot Fractures.—Specimens of partial fractures from small projectiles, though unusual, since such injuries are ordinarily reparable, are less infrequent in cabinets than illustrations of the effects of contusions. The Museum has a few examples:

CASE 1613.—Private Albert C——, Co. K, 6th Cavalry, aged 28 years, was wounded at Petersburg, April 1, 1865. On April 8th, he was admitted into Lincoln Hospital. Surgeon B. B. Wilson, U. S. V., reported: "The patient was a man of strong, plethoric habit, and in good condition; his mind was inclined to despondency. He had received a gunshot wound of the right shoulder, the ball entering in front of the joint, passing through, and was cut out posteriorly; the missile was a minié ball. Exploration with the finger discovered shattered fragments of bone, being either the head, or near the head, of the humerus. The soft parts were very much inflamed, and the whole arm was swollen; the discharge was healthy pus, slightly tinged with blood at first, but soon resumed its natural color and flowed freely. The arm was bandaged, and cold-water dressings were applied. At a consultation of surgeons to consider the propriety of resection, it was decided to wait for the inflammatory action to subside before operating. The patient continued to do well, the swelling subsiding, and the whole system becoming more comfortable until May 10th, when erysipelas set in and spread rapidly, going nearly to the median line both on the breast and back, and down the arm half way to the elbow. It was ushered in by a chill and accompanied by severe constitutional symptoms. Tincture of chloride of iron in doses of twenty drops was administered every two hours, and liniment of linseed-oil and lime-water applied locally. The inflammation ceased to spread twelve hours after the administration of the first dose of iron, and in a week the complications had disappeared. The discharge was suppressed during the attack. On April 29th, pyæmia was ushered in by a severe chill, followed by an exhausting sweat, the latter continuing with intermissions up to the time of the patient's death. One, two, or three of these chills occurred every day; the face and entire body became icteroid; there was pain in the right lung, with dyspnœa; the mind was dull, and the prostration was very great. The treatment consisted of the administration of quinine to the extent of forty grains per day, with capsicum and brandy freely, and beef essence. The diarrhœa and vomitings were treated with morphia. The patient died on the 4th of May. Autopsy eleven hours after death: Rigor mortis slightly marked; icteroid appearance of the whole body. There were small pyæmic abscesses at the apex of the right lung, which was also considerably collapsed by pressure of an effusion in the right pleural cavity, consisting of serum, fibrin, and pus intermixed. In the left pleural cavity four ounces of a similar effusion were found. In the middle lobe of the left lung were seventeen small pyæmic abscesses. The heart was normal, but contained fibrinous clots. The liver was honey-combed with pyæmic abscesses, one of which, in the superior portion of the right lobe, contained eight ounces of pus. The left kidney contained small abscesses in its substance, which opened into its pelvis when incised; there was a small abscess in the areolar tissue around the right kidney; the kidney was otherwise normal. The shoulder joint was not opened as had been anticipated, the ball having made a groove through the shaft of the humerus joint at the internal insertion of the capsular ligament, partially dividing that insertion and laying open the cancellated structure of the head. The joint was healthy, as was also the medullary canal of the humerus." The fractured portion of the humerus (FIG. 501) was contributed to the Army Medical Museum by Dr. Wilson.

FIG. 501.—Upper extremity of the right humerus partially fractured by a musket ball. *Spec.* 3807.

[1] Dr. BONTECOU'S reported case was one of shot contusion of the femur, and will appear in the next Chapter; but his recollection of examples of contusions of the humerus resulting in fatal pyæmia is important. Of the case which furnished *Specimen* 6309, nothing more has been learned than is stated in the text: *Specimen* 6312 is from the case of Corporal N. J. E——, Co. H, 8th New York Artillery (CASE 5, TABLE XIV, p. 468). The fact of a bullet grazing the humerus was undiscovered when the case was classified as a flesh wound.

[2] STROMEYER (L.), *Ueber die bei Schusswunden Vorkommenden Knochen-Verletzungen*, Freiburg, 1850, S. 3: "Sie trifft den Knocken," u. s. v.; or, as Mr. S. F. Statham translates: "They strike the bone without breaking it, and flatten themselves against its surface; the bone struck becomes necrotic from the destruction of its periosteum. In crowded hospitals such injuries of the larger long bones cause suppuration of the medullary canal, which, extending itself, at last, by the passage of pus into the veins, gives a fatal termination. In the autopsy (the bone being sawn in its long axis) the marrow is found filled with pus from the wounded part upward, and the same morbid product in the neighboring large veins; as in the femoral vein after contusion of the femur. The spot struck by the ball is colorless and exsanguine; in its circumference appears the commencement of a line of demarcation. Contusions of this kind, which, up to the present time, have been little attended to in the long bones, are well known in the bones of the skull, where caused by a blow or fall; they have the same dangerous consequences if not properly treated, as suppuration occurs in the diploe and purulent inflammation in the sinus, with its usual results. Such contusions also occur in the cranial bones, if a bullet strikes at a right angle, of which I have seen many examples, where it could be determined, from the character of the wound in the soft parts, that the same had been so struck, without causing fracture or depression of the bone."

[3] BECK (B.) (*Chirurgie der Schussverletzungen*, Freiburg, 1872, p. 66) cites two cases of shot contusions of the humerus. In one case the wound healed without complication and without necrosis, but the arm was still emaciated and powerless at an examination ten months after the injury, invaliding the patient: in the other case, the missile passed through the upper third and contused the bone. The wound healed well, but free motion of the arm in the shoulder joint remained impaired and the bone remained puffed up; the patient was also invalided. SOCIN (A.) (*Kriegschir. Erf.*, 1872, S. 106) tabulates three cases of contusion of the shaft of the humerus. Two were treated on wire splints. The patients recovered in 15, 49, and 82 days, respectively, with enlargement of the bone in every instance. In two cases, the functions of the arm and forearm remained normal; in the third case, extension of the wrist joint and the three last fingers became impossible.

PLATE L. SHOT CONTUSIONS OF THE SHAFT OF THE HUMERUS.

Fig. 1. Spec. 6309. Surgical Section. Fig. 2. Spec. 6312. Surgical Section.

Another case of partial shot fracture of the humerus was an interesting illustration of that rare occurrence, the lodgement of a ball in the medullary cavity of a long bone:

CASE 1614.—Corporal B. F. Knowlton, Co. I, 2d Wisconsin, aged 24 years, was wounded at South Mountain, September 14, 1862. He was conveyed to Frederick, and received into Hospital No. 1 three days after the injury. Acting Assistant Surgeon W. W. Keen, jr., contributed the specimen (*Cat. Surg. Sect.*, 1866, p. 600) with the following history: "The ball entered the left shoulder in the middle of a line drawn from the acromion to the anterior angle of the axilla, and entered the humerus, where it lodged. It was found impossible to extract the missile by forceps. On September 21st, it was decided to remove it. An incision was made three inches long, continuous with the wound and parallel to the fibres of the deltoid. The bone was found not to be fractured, but the ball had punched a hole in its anterior wall and had flattened out in the medullary cavity against the posterior wall. The insertion of the capsular ligament was involved, but there had been no tenderness of the joint nor escape of synovia, nor could the joint be discovered to be opened, and it was therefore decided not to resect. The opening in the bone was enlarged with the double-gouge forceps, and the ball was extracted. Half a grain of morphia was given immediately, and the wound was closed by sutures. No inflammation of the joint supervened. By October 14th, the wound had almost united, there having been but little and a healthy discharge. On November 12th, the wound had so nearly healed that the patient was able to be sent to his regiment for duty, having free though partly scapular motion of the arm." The specimen consists of a ball (FIG. 502) flattened to the diameter of an inch. After joining his command, the man was again wounded in the left ankle, at the battle of Fredericksburg, December 13, 1862. He was ultimately discharged from service, March 21, 1863, and pensioned. Examiner T. B. Smith, of Washington, D. C., April 1, 1863, certified: "Wound over outer malleolus, with injury to bone of left leg. Wound of left arm at shoulder joint, injury to bone; ball cut out of humerus. Neither wound healed." Disability, when first pensioned, rated total. Reduced to one-half on March 4, 1867. This pensioner was paid June 4, 1874.

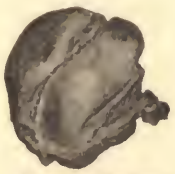

FIG. 502.—Flattened ball extracted from anterior wall of the left humerus. *Spec.* 4424.

The student is referred to other instances in the foot note.[1]

Complete Shot Fractures.—The shot fractures of the diaphysis of the humerus treated on the expectant plan were very numerous, and furnished examples of every variety of comminution, of extraordinary longitudinal fissuring, of detachment of large fragments, of cases in which the bone was almost pulverized at the point of impact, and, rarely, of cases of slightly oblique or nearly transverse fracture without splintering from missiles moving at a low rate of velocity. Besides these primary conditions, the cases of this category sometimes exhibited in great variety the phenomena attendant on periostitis, ostitis, osteomyelitis, osteoporosis, caries and necrosis, and, occasionally, of non-union and pseudarthrosis. Some illustrations of shot fractures of the upper third of the shaft have been given in treating of excisions. A few examples of such fractures in different portions of the shaft will be detailed here:

CASE 1615.—Brigadier General *Adams*, C. S. A., was wounded at Chickamauga. Surgeon Israel Moses, U. S. V., in charge of the hospital at Murfreesboro', Tennessee, reports: "He was wounded and brought in a prisoner, on September 19th, having received a ball in the left arm about the middle third, fracturing the bone and lodging. There was a good deal of tumefaction and pain, he having been brought some fifteen miles without any medical aid. Having been put under chloroform, September 23d, for the purpose of exploring the extent of the injury so as to determine whether amputation should be performed, Surgeon Moses cut down and found the ball embedded among the fragments, all of which were removed, together with the pointed end of the upper fragment. The bone was split up and down extensively, but, as there appeared good periosteal attachment, it was decided to attempt to save the arm. About four weeks after the operation his arm was put up in splints of coaptation, and he was sent under flag of truce to the rebel lines at the earnest solicitation of General Bragg. He will without doubt have a good arm." The above officer was probably Brigadier General Wirt Adams, who was still in service January 14, 1865. The specimen (*Cat. Surg. Sect.*, 1866, p. 123) consists of "six fragments of bone, representing two inches in length, and a battered conoidal ball, removed from the middle third of the shaft of the left humerus." It was contributed by the operator, and is represented in the accompanying wood-cut (FIG. 503) of half of the natural size.

FIG. 503.—Fragments of shaft of humerus and battered conoidal ball. *Spec.* 2146. ½.

It will be seen that, by many surgeons, the necessity for removal of even a large

[1] Specimen 2387 (*Cat. Surg. Sect.*, A. M. M., 1866, p. 123). "The upper third of the left humerus. From the inner portion of the shaft a triangle two and a half inches long by one inch broad at the base, which rests on the epiphyseal, has been fractured. A fissure of two and a half inches exists in the outer bicipital ridge independent of the fracture." In MS. *Register of Shot Wounds of Upper Extremity*, S. G. O., Vol. XXII, see cases of Pt. G. Loyd, 6th Indiana; Pt. J. Haskins, 1st Tennessee Artillery; Pt. A. Brown, 64th New York; Pt. F. Stayback, 16th Illinois. In Vol. VI (*Shot Fractures of the Humerus*), see cases of Pt. A. Lester, 134th New York; Pt. J. W. Collins, 29th Maine; Pt. J. G. Harvey, 39th New Jersey; Pt. J. R. Glongre, 2d Vermont; Pt. J. Hillen, 5th New York; Pt. D. Savage, 183d Pennsylvania; Capt. H. C. Smith, 6th Kentucky; Lieut. W. M. Begole, 24l Michigan; Pt. G. W. Beam, 103d Illinois.

number of detached fragments or primary sequestra was not regarded as a contra-indication of expectant conservative treatment. Shortening usually followed, but almost any deformity was thought tolerable could the functions of the hand be preserved.

The cases in which there was more or less trouble from consecutive exfoliations or extended necrosis were the rule rather than the exception, and cases complicated with wounds of the trunk were very common:

CASE 1616.—Sergeant-Major M. E. Haas, 4th Ohio, aged 20 years, was wounded at Morton's Ford, February 6, 1864, and sent to a Second Corps hospital the next day. Surgeon I. Scott, U. S. V., reported: "On admission, the patient was immediately placed under the influence of chloroform and the wound carefully examined, when it was found that the ball had gone directly through the upper third of the shaft of the right humerus, passing under the scapula, and was subsequently extracted from the lower edge of the left scapula. As the patient was young and had a vigorous constitution, it was decided to attempt the preservation of the limb, although there was considerable comminution of bone." This soldier was sent to St. Paul's Church Hospital, Alexandria, March 24, 1864, transferred to Ohio in April, discharged June 21, 1864, and pensioned. Examiner L. M. Whitney, of Ohio, reported, November 15, 1864: "A musket ball entered the right arm, striking the humerus about the centre of its long axis, shattering it, and, passing upward and inward, through the right shoulder, crossed the back to the inferior part of the scapula of the left side. * * Very partial use of left arm; the original wound is still open, and pus discharging, from disease of bone. Deafness also succeeded the receipt of this injury, and is now a decided disability." Examiner J. R. Rainey, of Illinois, reported, February 1, 1872, confirming the above, and adds: "Fracture of right scapula, resulting in contraction of the tendons and absorption of the deltoid muscle. Cannot rotate the arm, nor perform any labor requiring the use of the arm above, or on a level with, the shoulder. There is partial deafness in both ears. Disability one-half." This pensioner was paid September 4, 1873.

CASE 1617.—Private T. McC———, Co. A, 4th New York, aged 22 years, was wounded at Antietam, September 17, 1862. He was conveyed by railway to Baltimore, and received into Newton University Hospital. Surgeon C. W. Jones, U. S. V., contributed the specimen (FIG. 504, see *Cat. Surg. Sect.*, 1866, p. 132), with the following history by Acting Assistant T. H. Currey: "This man was admitted September 20th, with gunshot wound of left arm by a conoidal ball, causing compound comminuted fracture of the humerus; the point of entrance being four inches below the head of the humerus on the anterior side, and that of exit six inches below the head of the bone, on the posterior aspect. Previous to starting for this hospital, the wounded limb had been bound with splints and bandaged, for comfort and convenience of travel. These gave him a great deal of pain. When admitted into this hospital, the splints were removed and the arm rested upon a pillow covered with oiled silk. A continuous stream of cold water was then kept running upon the arm until the inflammation was controlled, the swelling abated, and suppuration commenced. Linseed poultices were then applied to promote suppuration. During the inflammatory stage saline cathartics were used to evacuate the bowels and counteract the constipating effect of the opium which was used at night to lessen pain and induce sleep. The poultices were continued for several days. Bandages were applied snugly from the hand to the shoulder to prevent the pocketing of pus. The wound at the point of entrance healed kindly; the other continued to discharge pure healthy pus. On October 10th, the wound was carefully probed, when some loose particles of bone were detected, and also an extensive denuded surface of the bone. It was now determined to remove the diseased bone. Accordingly the patient was put under the influence of chloroform, and an incision, four inches long, was made hard down upon the anterior part of the bone, the loose pieces of bone removed, and the denuded portion dressed down smoothly with the chisel and scraper. After this a sponge tent was inserted and allowed to remain twenty-four hours, after which it was removed and a linen one used instead. The linseed poultices were again used, and, when granulation was fully established, the edges were approximated by adhesive strips and covered with cloth spread with resin ointment. The constitutional treatment during this stage was supporting, accompanied by generous diet. The wound continued to heal kindly until November 15th, when, at the point of exit, it presented the appearance of a small abscess. This was lanced and the probe introduced, when a small piece of bone was felt near the surface and removed by the ordinary dressing forceps, after which the wound healed rapidly. Again, on December 16th, the cicatrix at the point of entrance looked as if an abscess was pointing. This was promptly opened, and a foreign body found within. The forceps were introduced and a thin scale of lead removed. This had been scraped from the ball as it entered the bone, and was lost in the muscular structure of the arm. The wound then filled up rapidly and soon closed. On December 21, 1862, the patient was discharged and pensioned, his wounds being all healed and his arm increasing in strength and usefulness every day. Thus a valuable member of this poor man's body was saved after having been condemned to amputation by several respectable surgeons on the field. In connection with the fracture and its mode of cure this important fact was noticed: The bone was fractured in large and long splinters, extending from within one inch and a half of the condyles to within three inches of the head of the bone. These fragments united, and that so firmly too as to enable the patient to raise the arm from the side of the body by its own power; this, too, long before suppuration had ceased or the external wound had healed." The specimen consists of a shaving of lead and ten small necrosed fragments of bone, removed at various times from the shaft of the humerus. Examiner W. M. Chamberlain, of New York, May 13, 1863, certified: "The left humerus has been shattered and is now in a condition of necrosis. It is an inch or more shorter than its fellow. He has the marks of pulmonary consumption also." The disabilty was rated total for gunshot wound and phthisis. The man died on August 24, 1863. His attending physician, Dr. J. C. Acheson, of New York, testified "that up to the time of his death he was suffering with phthisis pulmonalis, aggravated by an unhealthy suppurating gunshot wound of the arm."

FIG. 504.—Ten small fragments removed at various times from a shot fracture of the left humerus. *Spec.* 1112.

It was sometimes remarked that lateral shot perforations of the arm, with long fissuring of the humerus, were more troublesome than the fractures resulting from antero-posterior perforations; but this generalization needs confirmation:

CASE 1618.—Private *D. P. Morris*, 30th North Carolina, aged 46 years, was wounded at Gettysburg, July 1, 1863, and sent to Seminary Hospital. Surgeon A. B. Ward, 2d Wisconsin, reported: "Gunshot wound of arm." On July 25th, the patient was transferred to Camp Letterman, where Acting Assistant Surgeon J. Newcombe reported: "A ball entered the arm about four inches below the acromial process, on the outer side, and, passing upward and inward, lodged underneath the integument of the upper part of the anterior wall of the axilla, from which it was extracted. The humerus was considerably comminuted. There is now considerable discharge from both wounds." The general health of the patient was not good during the month, and the arm was swollen and painful up to August 18th; there was a general improvement in the condition of the patient recorded during the remainder of August, and the wounds were closed on the 13th August. He was reported as "about the same" on the 15th September, and he was transferred, for exchange, October 14, 1863.

The drain upon the system from protracted irritation and suppuration sometimes fatally impaired the health years after the reception of the injury:

CASE 1619.—Private A. Vanaken, 20th New York, aged 31 years, was wounded at Gettysburg, July 1, 1863. Surgeon A. B. Ward, 2d Wisconsin, reported, from Seminary Hospital, a shot wound of the left arm, and the patient's transfer, July 11, 1863, to Turner's Lane, when Acting Assistant Surgeon C. B. King recorded: "A compound fracture of the left humerus; the ball entered about three inches below the head of the bone and made its exit at a point directly back, comminuting the bone. An angular splint was applied. General health good. A number of pieces of bone can be felt. August 30, 1863: Wound granulating; small piece of bone removed. October 10, 1863: Wound closed, and bone united firmly, with good use of arm." Discharged November 30, 1863, and pensioned. Examiner E. Hall, of New York, reported, March 21, 1866: "The bone was badly shattered and still exfoliates; the arm and joint are quite stiff, and of little use. Disability total, and probably permanent." This pensioner died February 28, 1868.

Perfect union after extensive comminution was very tardy in taking place; but the reparative process was accelerated by the opportune removal of sources of irritation:

CASE 1620.—Corporal L. Schroeder, Co. E, 1st Artillery, aged 30 years, was wounded at White Oak Swamp, June 30, 1862, and, after a few days, fell into the enemy's hands. The case is first recorded in hospital at Camden Street, Baltimore, by Assistant Surgeon R. Bartholow, U. S. A., July 25, 1862: "Vulnus sclopeticum; transferred to New York, September 25, 1863." Acting Assistant Surgeon W. E. Townsend reported that this soldier was admitted to post hospital at Fort Independence shortly afterward, and discharged February 12, 1864, and pensioned, Dr. Townsend certifying that the right arm was useless from the effect of a gunshot wound. Examiner A. W. Dodge, of Baltimore, reported, September 9, 1869, that "a ball entered the anterior aspect of the right shoulder near the joint, and, passing obliquely downward, issued on the opposite side, three inches lower than the point of entrance, shattering the humerus. Large sequestra have been removed, and the arm is atrophied, and is too weak at this point to sustain any muscular exertion, such as is required for the performance of manual labor. Disability total." Examiners Owings, Jones, and Dodge reported, October 3, 1873: "Partial anchylosis of the right shoulder joint, and fracture of the upper part of humerus; cicatrix adherent to bone. Disability total." While this soldier was at the Camden Street Hospital, in 1862, Acting Assistant Surgeon Darr published an account of the case,[1] derived from the notes of Acting Assistant Surgeon E. G. Waters, who attended the patient. Dr. Waters transmitted a similar report to this Office. Apart from the details already given, this interesting paper notes that the man was wounded while in a stooping position, elevating his gun. The ball was extracted the same day, and the arm was placed in an apparatus. After ten days, this soldier was captured and taken to Richmond, thence paroled and sent to Baltimore, July 25, 1862. Several detached fragments of bone were soon afterward removed by dressing forceps. On August 21th, Dr. Waters states there was no disposition to union, and the man was taken to the operating room to undergo excision of the head of the humerus, but firmly refused to submit to the operation. Four weeks subsequently, union had unquestionably taken place, and on October 30, 1862, union was firm. The patient was sent northward convalescent, and his subsequent history, until the autumn of 1873, is related above.

CASE 1621.—Corporal J. L. Sheffery, 5th New York, aged 32 years, was wounded at Gaines's Mill, June 27, 1862, and taken prisoner. There is no mention of this case prior to the record made at Satterlee Hospital, where the patient was received July 30th. From this record it appears that there was "gunshot wound and a compound fracture of the left humerus at the middle third, and excision of fragments of the bone, through an incision in the outer side of the arm, prior to admission. When admitted, there was a superficial ulcer occupying a portion of the original incision. The wound rapidly cicatrized, but no bony union took place. When the arm was supported the patient was able to execute a variety of motions." This man was discharged September 11, 1862, and pensioned. Examiner J. S. Delavan, of Albany, reported, January 3, 1866: "Wounded above elbow, left arm; resection performed; taken prisoner; for want of care a false joint formed, rendering arm worse than useless. Disability total and permanent." Examiner H. Pierpont, of New Haven, reported, July 22, 1867: "Wound of upper third of left arm, resulting in exsection of about two-thirds of the upper third of the humerus, and subsequent necrosis, and sloughing of the soft parts. At the present time the hand and arm are of no use whatever. The flexors of the hand and fingers are contracted, with flexion of the wrist to a right angle, and the fingers flexed, with loss of power to extend either fingers or wrist." This pensioner died in March, 1872.

[1] DARE (G. H.), *Conservative Treatment in Gunshot Fractures*; communicated to the "Army Medical and Surgical Society of Baltimore," February 19, 1863. *Am. Med. Times*, Vol. VI, p. 229.

In the four following examples of shot fractures of the shaft of the humerus treated on the expectant plan, forbearance from operative interference was carried to the farthest justifiable limits:

CASE 1622.—Private J. Rose, 54th New York, was wounded at Bull Run, August 29, 1862. Surgeon J. E. Summers, U. S. A., reported that he was received at the Baptist Church Hospital, Alexandria, on September 6th, with a "shot wound of the arm, and was transferred December 15th." He entered Ladies' Home Hospital, April 25, 1863, and was removed to Lovell Hospital, Portsmouth Grove, Rhode Island, July 23, 1863. Acting Assistant Surgeon H. B. Knowles reported: "A minié ball entered the posterior aspect of the left (right?) arm, passing directly through, and fracturing the humerus at the middle third. On admission, the arm was considerably inflamed and swollen, and on examination it was evident that sequestra existed." The condition of the patient having improved, an operation was done, August 8, 1863: "A linear incision was made down to the bone, on the posterior aspect of the arm, commencing about two and a half inches above the condyles of the humerus, and extending upward about four inches. Upon dissecting away the soft parts from the bone, several sinuses leading into and through the bone were exposed. An opening was made with the trephine and gouge, etc., sufficiently large, from which three sequestra, about two inches in length, were taken. Considerable caries of the humerus was found, which was also removed. After the hæmorrhage had ceased, the cavity was filled with dry lint, and cold-water applications continued." This soldier was transferred to the Veteran Reserve Corps, March 31, 1864, discharged April 16, 1864, and pensioned. Examiner C. Phelps, of New York, reported, October 13, 1868: "Gunshot fracture of the right humerus in the middle third, followed by extensive necrosis, and united. The temperature of the extremity is diminished and its muscular power enfeebled. The distal phalanx of the right middle finger has also been carried away by a shell." Examiner T. F. Smith, of New York, reported, November 7, 1868, substantially the same as above, adding: "The right arm is atrophied to a certain extent; the hand is cold and blue; he has no power in his right arm or hand." This pensioner was paid to December 4, 1872, and he has not since been heard from.

CASE 1623.—Private M. W. Cook, 6th New Hampshire, was wounded at Bull Run, August 29, 1862, and sent to Georgetown College Hospital, September 6, 1862. Assistant Surgeon J. M. Brown, U. S. A., reported: "Gunshot wound of shoulder; furloughed December 17, 1862." He was discharged, May 15, 1863, from Dover, New Hampshire, Acting Assistant Surgeon A. H. Robinson certifying that the injury was from a "musket shot, by which the left humerus was badly shattered; the arm rendered nearly useless." Examiner J. H. Wheeler reported, June 27, 1866, more facts than can be found elsewhere: "The ball entered on the anterior of the arm, eight and a half inches from the shoulder, and passed directly through, fracturing the humerus. A pasteboard splint was applied at Washington by Dr. Smith, of New York. Twenty-one pieces of bone and one of lead came away. A few pieces of bone worked down to the elbow and were cut out; the wound was eighteen months in healing. The arm is the full length. Is unable to fully straighten the arm, and cannot carry it behind, and with difficulty brings it to the head. The arm is smaller than the other. General health not so good as before injury." Examiner J. N. Buckman, of New Hampshire, reported, May 4, 1869: "A number of pieces of bone have been thrown off, and there is one and one-half inches shortening of arm. Patient suffers from increased pains extending from wound to left breast; the flexor muscles of the arm are contracted, so that he is unable to straighten it." Surgeon Wheeler, September 13, 1873, states that, "at present, patient suffers from weakness, an aching pain, numbness of the hand, and inability to move the arm perfectly."

CASE 1624.—Private H. Aust, 149th New York, aged 19 years, was wounded at Chancellorsville, May 3, 1863, and sent to a Twelfth Corps Hospital on the 17th. Surgeon H. E. Goodman, 28th Pennsylvania, reported "gunshot wound of right arm." The patient was sent to Douglas, and thence to Satterlee Hospital on June 17th. Medical Cadet N. M. Glatfelter recorded: "A ball entered at the exterior aspect of the arm, about two inches above the elbow joint, and, passing obliquely through the axis of the arm, fractured the humerus severely, and came out at the internal aspect, under and in front of the axilla. A large number of bone fragments were removed at different times." August 31, 1863, firm bony reunion is reported, with continued discharge from the wound, very slight motion in the elbow joint, and inability to close the hand completely. There is loss of motion in the shoulder joint, attributed chiefly to atrophy of the muscles, especially the deltoid. This soldier was discharged March 29, 1865, and pensioned. Examiner G. W. Cook, of New York, reported, September 22, 1866: "Wound of right arm about four inches above the elbow; now in a state of ulceration and necrosis. Atrophy of muscles, and anchylosis of elbow joint." Examiner B. F. Sherman, of Ogdensburg, reported, September 5, 1873: "Two or more constantly suppurating openings, and perfect anchylosis of elbow joint. Disability total." This pensioner was paid December 4, 1873.

CASE 1625.—Private J. M. Smart, 32d New York, was wounded at West Point, Virginia, May 7, 1862, and, two days after, sent to Hygeia Hospital, Fort Monroe, where Surgeon R. B. Bontecou, U. S. V., recorded "gunshot fracture of the left humerus." He was transferred, June 12th, on the transport Fulton, to New York, and entered Ladies' Home Hospital June 17, 1862. Surgeon A. B. Mott, U. S. V., reported: "Smart was in the act of stooping to aid his captain, who had just been shot, when a musket ball struck his left arm in front, one inch above the elbow joint, and, passing through the arm, splintered the humerus, but not completely fracturing it. He then threw off his jacket and fell back to the rear, and the arm was bound up with a handkerchief. The regiment being ordered to charge, he rejoined it, fell, and fractured the bone at the seat of the injury." He also, after this, fired ten rounds, and then got into a wagon and was carried to York River and down to Fort Monroe. Seven days after the reception of the wound the arm was put in splints. These were once renewed, and continued until July 5, 1862, when union of the shaft of bone was found to have taken place. The anterior wound meantime had closed. From the point of exit quite a large number of pieces of bone had come away. In the beginning of October, erysipelas attacked the wound. This soon yielded to treatment. The posterior wound healed in November, and, until the end of December, there was no discharge, and the patient had very good use of arm. At that time the anterior wound reopened, and suppuration continued until March 10, 1863. "The patient can use the arm pretty well; can flex the forearm to a right angle to the humerus, and can straighten it. There is considerable deformity, however, at the point of fracture, the arm being crooked, but this does not materially affect the use of the limb. April 2, 1863, the wound is now healed." This soldier was discharged June 11, 1863.

Pseudarthrosis was infrequent after shot fractures of the shaft of the humerus, although, after simple fractures, this diaphyses may be considered as almost the seat of predilection of that complication.[1] Six examples are recorded among the twenty-nine hundred cases treated by expectant measures, and a somewhat larger number among the excisions in the continuity. Two instances of the former category are detailed:[2]

CASE 1626.—Private J. Eggerstedt, Co. G, 2d United States Cavalry, aged 29 years, was wounded in the right arm, at Valverde, February 21, 1862. Dr. B. Norris, U. S. A., medical director of the troops engaged, reported on his list of casualties: "Gunshot fracture of humerus." The wounded man was conveyed to a hospital at Fort Craig, a distance of about five miles, where he was treated for a time. Subsequently he was transferred to the general hospital at Hot Springs, near Las Vegas, New Mexico, whence he was discharged on July 13, 1862, his term of service having previously expired. May 19, 1862, Assistant Surgeon B. Norris stated, in the certificate for pension, dated May 10, 1862, as follows: "A musket ball wound in right arm above elbow, fracturing the bone and permanently impairing the use of the arm." Examiner G. W. Mears, of Indianapolis, on October 3, 1862, certified: "Shot by a rifle ball passing through right arm near middle of humerus, having broken the bone, which never again united, leaving an artificial joint. In other respects, health good. * * In order to have a very imperfect use of his hand he is obliged to keep splints and a bandage upon his arm, &c." In another examination, for increase of pension, Dr. Mears reports the disability increased in consequence of "several efforts having been made to produce reunion of the fractured ends of the humerus without success, and the arm becoming somewhat painful." Examiner J. Phillips, of Washington, D. C., April 21, 1869, certified: "Ununited fracture of right arm. * * There is no discoverable defect of the system to account for his condition, &c." Examiner J. O. Stanton, on September 12, 1873, certified: "Ununited fracture. There is about two inches shortening of the limb, some atrophy of muscles of right forearm, and evident loss of strength. Can use the hand when the elbow is supported, and has then a good grasp of the hand, &c." The disability was rated total. Pensioner has been paid to June 4, 1865. This man visited the Army Medical Museum in the summer of 1867, when a photograph of him was taken. (*Surgical Series of Photographs*, No. 189, A. M. M.)

CASE 1627.—Private G. T. Abbott, Co. I, 4th Vermont, aged 21 years, was wounded at the Wilderness, May 5, 1864. From a field hospital he was received into Mount Pleasant Hospital on May 13th. Assistant Surgeon C. A. McCall, U. S. A., reported: "Gunshot wound of right arm. Transferred to Philadelphia, May 30th." Assistant Surgeon T. C. Brainerd, U. S. A., in charge of Broad and Cherry Streets Hospital, reported: "Gunshot fracture of right humerus. Water dressings and splints applied." On February 3, 1865, the wounded man was transferred to the Brattleboro' Hospital, Vermont, and on June 15th to Central Park, New York City. Acting Assistant Surgeon C. E. Phelps, from the latter hospital, reported: "Gunshot wound of right arm. A minié ball passed through middle third from within outward, producing oblique fracture of humerus. Missile cut out next day, in the field hospital. Fracture treated with right-angular splint. A month after reception of wound gangrene appeared, small in extent, but persistent. Result of injury, ligamentous union. On July 24th, an apparatus was furnished by Dr. E. D. Hudson, of New York, who reported: "Arm shortened one inch; some atrophy; false joint; fractured ends nearly in apposition; considerable enlargement about fractured part; functions of forearm good; arm useless." The patient was, on August 29th, admitted to Sloan Hospital, Montpelier, Vermont. Surgeon H. Janes, U. S. V., contributed a photograph of the patient (*Card Photos*, Vol. II, p. 113) with the following history: "Ball entered about the middle of arm on inner side, fracturing the humerus, and lodging under the skin on the posterior and outer side, where it was cut out. No bone was taken out with the ball, but a fragment, three-fourths by one-fourth of an inch, came out on the fourth day after the injury. Another fragment, one inch by one-fourth, and a small piece of the bullet, came away while he was at home on furlough, five months after the injury. No other pieces of bone have come away. No retentive apparatus was applied the first week after the injury. After that an angular curved splint was used for about two months, and afterward a pasteboard splint. About six weeks after the injury the wound became gangrenous, and nitric acid was freely used twice. Gangrene was arrested in about two weeks, and he began to improve very slowly, and was confined to the house about six weeks. The wound healed about the 1st of July, 1865, with a false joint. In the latter part of June, he was transferred to New York to be fitted with Hudson's retentive appa-

[1] Professor F. H. HAMILTON (*New Mode of Treatment of Delayed or Non-Union of a Fractured Humerus*, in *Buffalo Med. Jour.*, 1854, Vol. X, p. 142) remarks: "I have observed that non-union results more frequently after fracture of the shaft of the humerus than after fracture of the shaft of any other bone." This result is commonly ascribed to the difficulty of securing immobility in these fractures (NICAISE (E.), Article *Bras*, in *Dict. Encyc. des Sci. Méd.*, 1869, T. X, p. 520). Professor SÉDILLOT (*Du traitement des fractures des membres par armes à feu*, in *Arch. gén. de méd.*, Ser. VI, T. XVII, P. I, p. 401) observes: "Pseudarthrosis, so common in ordinary fractures of the humerus, especially in those of its upper half, because of the difficulty of immobilization of the arm, *are very rare after gunshot wounds*, and an explanation is found in the extent and activity of the osteogenetic process" in such grave injuries. NEUDÖRFER (J.) (*Handbuch der Kriegschirurgie*, 1872, B. II, S. 1179) remarks: "That in his own practice he has not met with a single case of pseudarthrosis after shot fracture. Only twice he had occasion to observe pseudarthrosis after shot fractures of the epiphysis of the humerus," and adds: "Pseudarthrosis, as a rule, is an evidence of a constitutional disease of the blood, which, by soldiers generally, and especially at the years in which they take the field, is rarely to be found. But retardation of the consolidation of shot fractures must not be called pseudarthrosis."

[2] The other four instances of pseudarthrosis after expectant treatment were: 1. Pt. J. Jackson, Co. B, 15th Wisconsin, aged 46, wounded at Chickamauga, September 19, 1863. Surgeon H. CULBERTSON, U. S. V., at Harvey Hospital, Wisconsin, July 12, 1864, notes: "Transverse fracture of right humerus below surgical neck; false joint at seat of fracture; external wound healed. Discharged September 20, 1864," and pensioned. The pension reports which extend to January 2, 1874, make no mention of the pseudarthrosis. 2. Pt. R. H. Miller, Co. A, 25th Ohio, wounded at McDowell, May 8, 1862. Surgeon L. G. MYERS, 25th Ohio, reported a "shot fracture of upper third of left humerus; general health good, but the fracture resulted in a false joint." 3. Sergeant J. D. Foulk, Co. A, 7th Iowa. Surgeon M. K. TAYLOR, U. S. V., noted: "Shot fracture of the lower third of the right humerus, resulting in a pseudarthrosis; discharged July 9, 1863." 4. Private J. W. Beaver, Co. G, 50th Indiana, aged 31, was wounded at Jenkins's Ferry, April 30, 1864, and taken prisoner; discharged May 30, 1865, and pensioned. Examiner J. Stillson, of Bedford, Indiana, reported, September 5, 1873: "He received a wound from an ounce ball which fractured the humerus in the lower third. The musculo-spiral nerve was severed; all its lower branches are paralyzed. Union has never taken place at the seat of fracture, but he has remaining a false joint with shortening of the humerus. The arm hangs as a useless appendage."

ratus, which he is now wearing. He can write with it, and do any kind of light work; without it the arm is nearly useless. Up to the time that the wound became gangrenous the patient was in good condition, and the wound seemed to do very well. After the gangrene the discharge was very profuse; a large abscess formed just above the wound, and the patient became much debilitated." He was discharged from service on September 25, 1865, and pensioned. Examiner G. S. Jones, of Boston, March 29, 1866, certified: "The wound was in the lower third of the right arm. The humerus has been fractured and now remains ununited, thereby rendering the forearm nearly powerless and useless." Examiner G. T. Gale, of Brattleboro', Vermont, September 12, 1867, certified: "The fracture was followed by gangrene, resulting in large loss of muscle and non-union of bone. Forearm hangs loosely by his side, almost entirely useless. Wounds are now closed, but open occasionally. Has very little control over motion of forearm and hand." Examiner H. S. Noble, of Chester, Vermont, reported, on September 4, 1873: "Nearly an inch of the bone is gone, and the upper and lower fragments are united by ligament. The arm is practically useless for purposes of manual labor, being entirely flail-like, and capable of being twisted upon itself nearly one and a half turns." The disability was rated total. The pensioner was paid March 4, 1875.

The old doctrine, that shot fracture of the humerus with wound of the brachial artery imperatively indicates amputation, is still earnestly maintained by Dr. Lœffler, though called in question by M. Legouest and others.[1] Surgeon A. H. Hoff, U. S. V., warmly advocated attempts to save the limb under these conditions.

CASE 1628.—Private W. Lay, Co. F, 129th Pennsylvania, aged 21 years, was wounded at Fredericksburg, December 13, 1862, and admitted to the 3d division hospital, Fifth Army Corps, where Surgeon D. McKinney, 134th Pennsylvania, recorded: "Gunshot fracture of arm; bone adjusted." On December 17th, he was transferred to Mount Pleasant Hospital, at Washington. Assistant Surgeon C. A. McCall, U. S. A., reported: "Compound fracture of humerus, with wound of brachial artery, by conoidal ball. Hæmorrhage from the injured artery occurred on December 19th, 20th, and 21st, and was restrained by mechanical means and persulphate of iron. No ligation was performed, and no recurrence of hæmorrhage took place after the 21st." The patient was discharged from service on April 16, 1863, and pensioned. Examiner T. B. Smith, of Washington, D. C., April 17, 1863, certified: "Wound still discharging; partial anchylosis of left elbow joint; bone now united; health good; motions of shoulder and hand perfect; limb now useless." Examiner E. Swift, of Easton, Pennsylvania, certified, on April 13, 1864: "The arm can be flexed to a right angle with the humerus and extended to an angle of about forty-five degrees, &c." Examiner P. R. Palm, of Allentown, Pennsylvania, reported, on October 14, 1871: "There is considerable deformity of the limb, the arm being curved backward. The joint is somewhat stiff, and the arm cannot be straightened, &c." On September 4, 1873, the last examiner again reported: "Elbow joint partly anchylosed and deformed, &c." The disability was rated three-fourths. Pensioner has been paid to March 4, 1875.

I confess that the evidence in this and three other reported cases[2] appears to me insufficiently circumstantial and precise to decide affirmatively this controvered point.

To avoid iteration, further comments on expectant conservative treatment of shot fractures of the humerus will be reserved for the concluding pages of this Chapter.

---

[1] LÖFFLER (F.) (*General-Bericht*, u. s. w., 1867, S. 179) contends that amputation of the arm is necessary in all cases in which the fracture of the humerus is accompanied by lesion of the brachial artery, and censures LEGOUEST (*op. cit.*, p. 529, 1st ed., p. 689), who observes: "Nous pensons que dans ci cas l'amputation n'est pas toujours indispensable. Si l'artère brachiale est lesée au-dessous des tendons des muscles grand-rond et coraco-brachial, la grande artère collatérale externe et la grande artère nourricière de l'humérus restant intactes, rétablissent assez facilement et assez rapidement la circulation pour autoriser la conservation du membre. Si, au contraire, l'artère brachiale est ouverte au-dessous de l'origine de ces vaisseaux, il vaut mieux pratiquer l amputation." Generalarzt LÖFFLER states: "That up to the present time, as far as I know, the literature of military surgery does not present a single case of preservation of the limb after injury of the brachial artery with shot fracture of the humerus," and adds: "Even LEGOUEST does not cite a case; his indication is more the result of *a priori* calculation, and has the fault, moreover, that it omits a consideration of the highest importance to this class of injuries, the relations of the brachial veins, which, at least in shot wounds, rarely remain uninjured when the artery has been struck. The mere contusion of the veins is sufficient to have considerable influence on the result of the injury." BILLROTH (TH.) (*Chirurg. Briefe aus den Kriegs Lazarethen*, u. s. w., Berlin, 1872, S. 223) remarks: "Whether shot fractures of the humerus, with injury of the brachial artery, always result in gangrene, I am not able to assert, as the two cases, in which gangrene of the arm supervened, were not carefully examined. That secondary ligation of the brachial for shot fracture of the humerus neither materially changes the circulation in the extremity nor obstructs consolidation, I have already stated."

[2] Surgeon IRA RUSSELL, U. S. V., reports, from notes of Surgeon B. O. REYNOLDS, 3d Wisconsin Cavalry, the case of: 1. Lieut. N. Cole, 20th Wisconsin, wounded at Prairie Grove, Arkansas, December 7, 1862: "Musket ball entered two and a half inches above right elbow joint, passed internally to the humerus, and made its exit posteriorly. Did well for seven days, when hæmorrhage occurred, and was restrained by the tourniquet. Two days afterward it again bled profusely, and I ligated the brachial artery three-quarters of an inch above its bifurcation, since which time the case has steadily improved." This officer was discharged and pensioned February 27, 1863. In 1868, Examiner L. D. MCINTOSH, of Sheboygan, reported: "Ball entered *left* arm, anteriorly, five inches below shoulder joint, and passed out opposite its entrance, severing the brachial artery and injuring the nerve. Secondary hæmorrhage supervening, the artery was ligated. The humerus was fractured. There is partial anchylosis of the elbow joint, etc." In 1873, Examiner HALL reports: "Arm considerably wasted, with numbness of ulnar border of forearm and hand." 2. Examiner O. MARTIN reports the case of Sergeant F. W. Briggs, 36th Massachusetts, wounded at Petersburg, June 17, 1864: "Ball hit an inch below coracoid process of right scapula, passed downward and outward, cutting off under side of neck of humerus, through the axilla, and out four inches below shoulder joint, on the back side of the arm. He was under my care for a long time, had gangrene and excessive hæmorrhage, and it was thought it would be necessary to amputate at the shoulder. Now (February 16, 1864) general health is good, shoulder stiff, bone diseased; no use of arm." 3. Pt. N. F. Huntley, Co. F, 5th Vermont, aged 35, was wounded at the Wilderness, May 5, 1864. Surgeon J. E. POMFRET, 7th New York Heavy Artillery, reported: "Severe wound of arm, with lesion of the brachial artery. Medical Director A. N. DOUGHERTY." The patient was discharged and pensioned February 22, 1865. Examiner C. PORTER, of Rutland, certified, March 22, 1865: "Gunshot wound of the right arm on the inner side, about three inches above the elbow joint, ball passing obliquely upward and out midway between the elbow and shoulder, destroying the brachial artery and injuring the nerve." Dr. PORTER reported, in September, 1873: "A musket ball fractured the right humerus about three inches above the elbow joint."

EXCISIONS IN THE CONTINUITY OF THE HUMERUS FOR SHOT INJURY.—The cases returned under this head are very numerous, and probably many mere extractions of fragments have been improperly classified as excisions; but, making every allowance for erroneous returns, the number of formal operations is unprecedentedly large; the entire number of operations comprised in the series is six hundred and ninety-six.

Primary Excisions of the Shaft of the Humerus.—Our surgeons evidently did not share the opinion of European authorities regarding primary excisions in the continuity, since nearly two-thirds of the operations belong to the primary group.

§ *Cases of Recovery.*—Three hundred and twenty-six such cases are reported.

CASE 1629.—Private C. W. C———, Co. F, 39th Illinois, aged 22 years, was wounded at Weirbottom Church, June 17, 1864. He was removed to the field hospital of the Tenth Corps. Surgeon C. M. Clark, 39th Illinois, reported: "Private Carpenter was wounded by a conoidal ball, which entered the right arm near the insertion of the deltoid muscle, passing obliquely backward and downward, and was cut out at the inner surface of the arm two inches below the point of entrance. The ball had extensively fractured the body of the humerus. Chloroform was administered and six inches of the bone were taken away (leaving the periosteum) by a longitudinal incision. The bone removed included the portions taken from each end of the remaining humerus. The wound was dressed in the usual manner, and the man put to bed in the provisional hospital, where he remained under my care for the space of three weeks, the wound healing rapidly. He was then sent to Chesapeake Hospital, remaining a short time, and subsequently to hospital at Willet's Point, New York, whence he was discharged from service. Before leaving New York Dr. E. D. Hudson applied a supporting splint, which gave the arm its normal strength and use to a great extent. The case came under my observation again in April, 1867, at which time the man was following the occupation of 'expressman,' and stated that he could use the arm about as well as ever. On examination of the arm after removal of the splint, I found the space formerly occupied by bone to be filled with a dense rounded mass of cartilage with some ossific deposits. He stated that the arm was not as firm as formerly because of an accident that he met with while leaping a fence, at which time he fell, striking the elbow of the injured arm and disrupting the tissue, which had become sufficiently firm to allow the raising of the arm from the shoulder without the appearance of any false joint, but now, on raising the arm, there was some bending. It was, however, growing stronger, and he thought that he could soon dispense with the splint. He is at the present time, December, 1869, following the occupation of a gardener, and makes good use of the arm." Dr. E. D. Hudson, of New York,[1] published the following memoranda of the case: "Five months after the operation he was sent from De Camp United States General Hospital to me for final treatment. His arm was shortened one inch. Nature had reproduced about one and a half inches, leaving a space of nearly two inches. Arm very flexile, uncontrollable, somewhat atrophied, and useless except to hold things when the forearm was extended. With sustaining apparatus applied as a representative shaft of bone, and auxillary straps of rubber webbing, he was able to control his arm and forearm, flex his forearm, lift with the forearm flexed, and will do good service. The appliance was efficient, and his arm will recuperate to a high and gratifying degree of usefulness." Examiner J. P. Lynn, of Chicago, February 27, 1868, reported: "He was struck by a ball in front, just below the surgical neck of the humerus. It passed through, shattering the bone, four inches of which were exsected. By an apparatus he wears he has a little use of the forearm." The Chicago Board, September 6, 1873, report: "Exsection of upper third of right humerus and anchylosis of what remains at shoulder joint. Loss of muscular structure of upper arm equal to loss of limb." This pensioner was paid March 4, 1874.

FIG. 505.—Apparatus in a case of excision of the shaft of the humerus. [After HUDSON.]

CASE 1630.—Lieutenant J. Egan, Co. C, 2d United States Cavalry, aged 27 years, was wounded at Cold Harbor, June 1, 1864. Assistant Surgeon J. W. Williams, U. S. A., reported: "A minié ball entered the upper third of the right arm, fracturing the humerus to the extent of three inches. Resection was performed and all the pieces of bone were removed, with the exception of a large piece on the internal aspect, which still preserved the length of the arm, and, from its intimate connection with the periosteum, was not likely to necrose. The operation was completed by smoothing the ends of the bone. Amputation was the preferable operation in this case, but the decided objection of the patient to losing his arm, and the situation of the internal fragment of bone decided the operation detailed above." The patient was transferred to Washington, and admitted into Stanton Hospital on June 4. Surgeon J. A. Lidell, U. S. V., reported: "Gunshot fracture of right humerus. Excision performed on field, of about two inches, by a straight incision through biceps muscle; ball extracted through place of entrance. Ice dressings and splints applied; tonics, stimulants, and saline cathartics prescribed." Surgeon B. B. Wilson, U. S. V., who was subsequently in charge of Stanton Hospital, performed an operation on March 14, 1865, in connection with which he reported the following: "Entire bony union of humerus. A cloaca, one inch in diameter, formed on the external edge of the biceps and on a level with and just below the insertion of the deltoid. Cut down on the external edge of the biceps, enlarged the cloaca with bone forceps to the extent of three inches, and removed the necrosed portion of the humerus, three inches long. Cold-water dressings applied." The patient was, on April 20th, transferred to Annapolis Hospital, whence he returned to his command for duty on May 25, 1865. In February, 1868, Lieutenant Egan was promoted captain.

[1] HUDSON (E. D.), *Save the Arm. Remarks on Exsection, with Cases and Plates*, New York, 1865, p. 13.

TABLE LVI.

Condensed Summary of Three Hundred and Twenty-six Cases of Successful Primary Excisions in the Shaft of the Humerus after Shot Injury.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	*Abbott, J.*, Pt., I, 8th Alabama, age 23.	Oct. 27, 28, '64.	Left; three inches middle third. February 28, 1865, union; entire recovery. Retired.
2	Abbott, L. D., Corp'l, K, 38th Massachusetts.	Sept. 19, 19, '64.	Left. Discharged June 30, 1865; not a pensioner.
3	Ainsworth, M. V. B., Serg't, I, 74th New York.	June 17, 17, '64.	Right; three inches lower third. Disch'd May 17, 1865. Limb shortened two inches.
4	Albright, F., Pt., B, 20th Michigan, age 28.	June 2, 2, '64.	Right; four inches middle third; Surg. W. B. Fox, 8th Michigan. Discharged May 4, 1865.
5	Alberts, B., Pt., E, 10th New York Cavalry.	April 9, 9, '65.	Right; two and a half inches middle third. Disch'd June 30, 1865. Arm shortened one inch and atrophied.
6	Allen, W. L., Pt., H, 1st Maine H. A., age 18.	June 4, 4, '64.	Left; portion lower third. Discharged November 19, 1864.
7	Amos, F., Lieut., H, 31st Iowa, age 34.	Aug. 24, 24, '64.	Right; two inches of upper third; Surg. G. L. Carhart, 31st Iowa. Discharged February 2, 1865; good union.
8	Andrew, H., Corporal, K, 116th Ohio, age 22.	June 1, 1, '64.	Left; two and a half inches lower third. Disch'd Feb. 14, 1865.
9	*Andrews, W. H.*, Pt., K, 13th Virginia.	July 3, 3, '63.	Left; upper third. Nov. 12, 1863, sent to City Point for exchange.
10	Ault, J., Pt., C, 101st Indiana, age 28.	Nov. 25, 25, '63.	Left; two inches. Dec. 8th, arm amputated one and a half inches below shoulder joint, by Surg. C. Sollheim, 9th Ohio. Disch'd June 1, 1864.
11	Bachelor, T. C., Lieut., I, 79th Indiana.	May 27, 27, '64.	Left. Disch'd October 4, 1864. Artificial joint at upper third.
12	Bagley, A., Pt., A, 19th Maine, age 36.	May 6, 6, '64.	Right; three inches; by Surg. G. Chaddock, 7th Mich. Disch'd March 1, 1865; no union.
13	Baker, J., Pt., I, 125th Ohio, age 18.	June 18, 18, '64.	Left; middle third; by Surg. F. W. Lytle, 36th Illinois. Duty April 10, 1865.
14	*Baker, L. S.*, Brig. Gen., age 31.	Aug. 1, 2, '63.	Right; three inches. Recovered.
15	Baldwin, W., Pt., G, 8th Michigan.	Aug. 19, 19, '64.	———; fragment at lower third. Discharged June 8, 1865. Anchylosis of joint.
16	Ball, W. M., Pt., H, 22d Kentucky.	May 16, 16, '63.	Right; upper third; by Surgeon B. F. Stevenson, 22d Kentucky. Duty November 28, 1863.
17	Banks, J. H., Corp'l, E, 13th Maine, age 27.	May 18, 21, '64.	Right; five inches middle third. July, 1866, amputation at junction of upper and middle third, by Dr. W. H. True, of Freeport, Maine.
18	Barber, A. D., Pt., K, 19th Ohio, age 19.	Sept. 2, 3, '64.	Right; two inches lower third; by Surg. D. C. Patterson, 124th Ohio. Disch'd June 5, 1865.
19	Barnett, W. B., Lieut., B, 97th Ohio, age 28.	June 22, 22, '64.	Right; lower third; Surg. E. B. Glick, 40th Indiana; July 20th, amputation at upper third, by Act. Asst. Surg. L. E. Kelley. Resigned March 9, 1865; pensioned.
20	Barnhizer, J. D., Pt., E, 7th Michigan, age 18.	May 12, 12, '64.	Left; upper third; three inches; by Surg. G. Chaddock, 7th Mich. Discharged October 4, 1864; pensioned; arm useless.
21	Bausinger, C., B, 149th New York, age 20.	July 2, 2, '63.	Right; upper fourth; four inches; by Surg. J. V. Kendall, 149th N. Y. Vols. To V. R. C. Oct. 16, 1864, pensioned.
22	*Barnwell, B. T.*, Lieut. Confed. Navy, age 23.	Feb. 6, 7, '65.	Left; middle third; two inches excised. Released June 29, 1865.
23	Bell, S. T., Pt., Co. K, 111th Penn., age 19.	July 3, 4, '63.	Left; middle third; Surg. Geo. P. Oliver, 111th Penn. Mustered out February 27, 1865.
24	Bett, G., Pt., K, 5th New Jersey, age 25.	May 5, 6, '62.	Right; middle third; by Surg. C. W. Horner, U. S. V.; April 11, 1863, amputated at upper third. Disch'd Oct. 1, 1863.
25	Bennett, J., Pt., B, 23d Wisconsin, age 18.	May 22, 22, '63.	Left; two inches of middle third; by Surg. J. W. Angell, 23d Wis. Discharged August 19, 1865.
26	Berk, J. O., Pt., Co. A, 7th Connecticut, age 31.	Jan. 15, 17, '65.	Right; two inches; by Surg. G. C. Jarvis, 7th Connecticut. Discharged July 6, 1865.
27	Berrigan, E., Pt., I, 32d Massachusetts, age 40.	May 31, 31, '64.	Left; three inches excised. Discharged Jan. 18, 1865; pensioned.
28	Bishop, A. J., Pt., A, 27th Ohio, age 25.	July 22, 23, '64.	Left; four inches of upper third excised. Disch'd May 12, 1865; pensioned; arm useless.
29	Bixby, C. F., Pt., M, 2d Cavalry, age 19.	June 12, 12, '64.	Left; five inches of middle third excised. Disch'd Jan. 12, 1865; pensioned.
30	Blanchard, J., Pt., B, 10th Vermont, age 23.	Nov. 27, 30, '63.	Left; two and a half inches of middle third excised. Discharged February 22, 1865.
31	Book, E., Pt., D, 57th Indiana, age 31.	Dec. 22, 22, '64.	Left; three inches of upper third excised. Disch'd May 17, 1865.
32	Bohnsack, H., Pt., F, 3d Mass. Cavalry, age 32.	May 9, 11, '64.	Left; four inches of upper third; by Asst. Surg. C. H. Andrews, 128th New York. Disch'd Jan. 30, 1865; pensioned.
33	Boice, A., Corp'l, B, 91st Ohio, age 21.	Aug. 24, 24, '64.	Right; four inches of middle third; by Asst. Surg. J. B. Warwick, 91st Ohio. Discharged May 29, 1865; pensioned.
34	Bolger, M. J., Pt., D, 10th Ohio.	Oct. 8, 11, '62.	Left; three inches of middle third excised. Discharged March 17, 1863; re-enlisted; mustered out August 28, 1866; pensioned.
35	Bostwick, E. M., Corp'l, H, 2d New York Cavalry, age 19.	April 1, 1, '65.	Left; three inches of middle third; by Surg. S. F. Kingston, 2d New York Cavalry. Disch'd Nov. 24, 1865; pensioned. *Spec.* 2431.
36	Bratscher, G. W., Pt., D, 19th Colored Troops.	July 30, 31, '64.	Left; two and a half inches of upper third; by Surg. J. S. Ross, 11th New Hampshire. Disch'd June 28, 1865; pensioned.
37	Brelsford, H. W., Serg't, H, 80th Ohio.	May 14, 14, '63.	Left; lower third; by Surg. E. P. Buell, 80th Ohio. Disch'd Oct. 26, 1863; pensioned.
38	Bresler, H., Pt., E, 45th Pennsylvania, age 19.	Oct. 11, 11, '63.	Left; four inches of upper third excised. Disch'd Sept. 14, 1864; pensioned.
39	Brown, C. B., Pt., F, 3d New York, age 23.	Oct. 27, 27, '64.	Right; three inches excised. Deserted April 28, 1865; not a pensioner.
40	Brown, F., Pt., G, 114th Illinois, age 21.	July 14, 17, '64.	Right; middle third; by Acting Asst. Surg. W. D. Hall. Recovered; not a pensioner.
41	Brown, G. D., Pt., A, 184th Penn., age 21.	Nov. 26, 26, '64.	Left; three inches of lower half; by Surg. G. Chaddock, 7th Mich. Disch'd June 19, 1865; pensioned.
42	Brown, J. R., Corp'l, A, 101st Illinois, age 20.	July 24, 24, '64.	Right; two inches of middle third; by Surg. H. K. Spooner, 61st Ohio. Discharged June 22, 1865; pensioned; hand useless.
43	Bryan, L. V., Corp'l, E, 8th Kansas, age 30.	Dec. 16, 16, '64.	Right; two and a half inches at middle third; false joint; arm useless. Disch'd April 18, 1865; pensioned.
44	Bunker, H. W., Lieut., H, 10th Iowa, age 23.	Nov. 25, 25, '63.	Right; four inches of middle third; by Surg. R. J. Mohr, 10th Iowa. Mustered out Oct. 11, 1864; pensioned.
45	Burroughs, H., Corp'l, I, 1st U. S. Sharpshooters.	July 2, 2, '63.	Right; excision at middle third; by Surg. H. F. Lyster, 5th Mich. Discharged June 7, 1864; not pensioned.
46	Burroughs, S. L., Capt., A, 2d New York Cavalry, age 26.	May 31, June 1, 1864.	Left; middle third; by Surg. L. P. Woods, 5th New York Cav. Disch'd Sept. 10, 1864; pension'd.
47	Bush, J. A., Serg't, D, 154th New York, age 30.	July 2, 2, '63.	Right; four inches of upper third; by Surg. H. Van Aernam, 154th New York. Discharged Jan. 30, 1865; pensioned.
48	Bymer, W. H., Pt., H, 5th New York, age 21.	June 27, 27, '62.	Right; four inches of upper third; by A. A. Surg. J. Swinburne. Discharged May 25, 1863; arm useless.
49	*B———, J. B.*, C. S. A.	Sept. 25, 25, '64.	Four inches of middle third; by Dr. A. Thompson, of Humboldt, Tenn.; "far better than no arm."
50	Camp, J., Pt., E, 12th Wisconsin, age 30.	July 21, 21, '64.	Left; three inches of upper third; by Surgeon J. S. Reeves, 78th Ohio. Disch'd Sept. 20, 1865; pensioned.
51	Campbell, J. L., Pt., C, 9th New York Cavalry, age 26.	May 8, 8, '64.	Left; four inches of upper half. Disch'd Jan. 30, 1865; pensioned.
52	*Cantrell, J. L.*, Pt., A, 7th Texas, age 27.	Nov. 29, 29, '64.	Left; three inches of middle third; by Surg. J. R. Crain, 7th Texas. To Provost Marshal Jan. 7, 1865.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
53	Carpenter, C. W., Pt., F, 30th Illinois, age 22.	June 17, 17, '64.	Right; four inches of middle third; by Surg. C. M. Clark, 30th Ill. Discharged December 8, 1864.
54	Carpenter, W. P., Pt., D, 101st Indiana, age 21.	June 27, 27, '64.	Left; three inches; by Surg. C. N. Fowler, 105th Ohio. Disch'd June 12, 1865. Died May 18, 1870.
55	*Carrer, A. R.*, Lieut., B, 56th N. Carolina, age 36.	May 13, 13, '64.	Two inches of middle third. Furloughed July 29, 1864.
56	*Carroll, M.*, Corp'l, C, 8th Virginia.	May –, –, '64.	Four inches of middle third; by Surg. Kennedy, C. S. A.; doing well May 24, 1864.
57	Carter, H. W., Pt., D, 8th N. Y. Heavy Artillery.	June 3, 3, '64.	Left; three inches of upper third; by Asst. Surg. E. P. Casey, 8th N. Y. Heavy Artillery. Disch'd June 13, 1865; pensioned.
58	Cary, M. L., Serg't, C, 1st Rhode Island Cavalry, age 25.	Sept. 14, 14, '63.	Four and a half inches of upper half. Discharged December 24, 1863; pensioned.
59	Carver, B., Serg't, A 142d New York, age 27.	Sept. 29, 29, '64.	Right; two and a half inches; by Surg. D. McFalls, 142d N. York. Disch'd Jan. 4, 1865; pensioned.
60	Childs, H. F., Pt., G, 95th Illinois, age 22.	June 17, 18, '64.	Left; two inches of lower third; by Acting Ass't Surg. S. S. Jessop. July 23d, amputated at middle third, by A. A. Surg. R. W. Clark. Disch'd Jan. 26, 1865.
61	Chrispin, G., Pt., C, 10th Pennsylvania Reserves, age 19.	May 8, 8, '64.	Right; middle third; by Ass't Surg. B. Howard, U. S. A. Mustered out July 18, 1865; pensioned.
62	Churchill, W. S., Pt., C, 20th Connecticut, age 20.	July 20, 20, '64.	Right; portion of the upper third. Disch'd June 30, 1865; pensioned.

259	Riffles, D. J., Pt., B, 10th West Virginia, age 19.	Mar. 31, 31, '65.	Left; three inches middle third; by Surg. C. M. Clark, 39th Ill. Duty July 26, 1865.
260	*Riley, W. H.*, Pt., A, 59th Virginia, age 28.	June 17, 17, '64.	Right; in lower third. Furloughed July 28, 1864.
261	Roberts, B. F., Pt., I, 138th Penn., age 18.	Nov. 27, 27, '63.	Left; two inches of lower third. Disch'd May 5, 1865; necrosis and ulceration.
262	*Roberts, G. M.*, Pt., B, 13th Georgia, age 26.	Oct. 19, 19, '64.	Left; in middle third. Transferred to Fort McHenry Jan. 5, 1865.
263	Roberts, S. G., Lieut., B, 17th Mass., age 25.	April 9, 11, '63.	Right; two inches middle third; by Surg. C. A. Cowgill, U. S. V. Disch'd August 3, 1864; perfect recovery.
264	Robinson, D., Pt., D, 56th Massachusetts, age 35.	May 18, 18, '64.	Left; three inches middle third; by Surg. T. F. Oakes, 55th Mass. To V. R. C. May 4, 1865; ligamentous union; useful arm.
265	Robson, J., Pt., E, 32d-9th Massachusetts, age 26.	May 7, 8, '64.	Right; in lower third. Disch'd June 23, 1865; loss of use of forearm.
266	Robinson, J. Y., Pt., I, 8th Kansas, age 22.	July 21, 22, '64.	Left; two inches upper third. Duty Jan. 18, 1865; osseous union.
267	Rohe, G. A., Corp'l, H, 97th New York, age 33.	May 7, 7, '64.	Left; portion in the upper third. Discharged September 11, 1865.
268	Rosenthal, L., Pt., F, 69th New York, age 32.	June 16, 16, '64.	Right; portion in middle third; by Surg. S. H. Plumb, 82d N. Y. Discharged March 29, 1865.
269	Ross, G. M., Lieut., G, 77th New York.	Sept. 19, 20, '64.	Right; upper third; by Surg. G. T. Stevens, 77th N. Y. Duty Nov. 4, 1864; perfect recovery; arm nearly as useful as the other.
270	Rowley, E., Pt., I, 8th Iowa Cavalry, age 18.	May 13, 14, '64.	Left; two inches middle third; by Surg. W. H. Finley, 8th Iowa Cavalry. Disch'd July 10, 1865.
271	Ruddock, W., Corp'l, C, 117th New York, age 21.	Oct. 27, 27, '64.	Left; three and a half inches lower third; by Surg. H. W. Carpenter, 117th N. Y. Discharged May 4, 1865; useful arm.
272	*Russell, J. M.*, Pt., F, 12th Mississippi.	July 20, 21, '64.	Left; four inches. Furloughed Sept. 10, 1864; suppuration when furloughed.
273	Rutherford, C. E., Pt., A, 66th Illinois, age 31.	May 16, 16, '64.	Right; three and a half inches middle third; by Surg. W. R. Marsh, 2d Iowa. Disch'd June 13, 1865; no bony union.
274	Rykert, G. M., Corp'l, C, 154th N. York, age 22.	July 1, 3, '63.	Right; four inches upper third. Disch'd Jan. 11, 1864; no control of arm.
275	Saunders, J., Pt., B, 31st Maine, age 18.	May 12, 13, '64.	Right; middle third; by Surg. L. W. Bliss, 51st N. York. Disch'd May 18, 1865.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
276	Scanlon, J., Pt., A, 111th Ohio, age 21.	June 2, 2, '64.	Left; five inches upper third; by Surg. C. W. McMillen, 1st Tenn. Disch'd Feb. 10, 1865.
277	Scott, F., Serg't, B, 23d Wisconsin, age 27.	Nov. 3, 3, '63.	Left; in upper third. Discharged March 10, 1864.
278	Scott, J., Pt., E, 29th Colored Troops, age 27.	July 30, 30, '64.	Left; two and a half inches upper third; by Surg. D. Mackay, 29th U. S. Colored Troops. Disch'd June 8, 1865; arm useless.
279	Shaffer, H., Pt., G, 12th Indiana, age 19.	May 13, 13, '64.	Left; two and a half inches at junction of lower and middle thirds; by Surg. A. Goslin, 48th Illinois. Disch'd June 14, 1865.
280	Shattuck, N., Pt., F, 5th Michigan, age 23.	Oct. 27, 27, '64.	Right; portion of upper third. Disch'd Feb. 18, 1865.
281	Shelfrey, J. J. L., Corp'l, K, 5th N. York, age 25.	June 27, 27, '62.	Left; injured portion, middle third; by A. A. Surg. J. Swinburne, U. S. A. Disch'd Sept. 10, 1862; no bony union; arm useless.
282	Shumway, D., Pt., K, 19th Ohio, age 25.	June 17, 18, '64.	Right; one and a half inches. Discharged Nov. 24, 1865; ununited.
283	Sigler, J. W., Capt., I, 150th Penn., age 31.	May 10, 10, '64.	Three inches lower third. Duty July, 1864; bone united; arm weak. Died Jan. 12, 1869.
284	Smead, L. B., Pt., A, 9th New York Cav., age 35.	May 7, 7, '64.	Right; two inches upper part of middle third; by Surg. B. G. Streeter, 4th N. Y. Cav. Disch'd Oct. 11, 1864; no bony union; arm of some use. *Phot.*, No. 2.
285	Smith, A. H., Pt., A, 7th Indiana, age 26.	May 25, 27, '64.	Right; three and a half inches upper third. Disch'd May 25, 1865.
286	*Smith, H. T.*, Pt., C, 28th Georgia, age 20.	July 3, 4, '63.	Left; six inches upper third; by Surg. W. J. Arrington, C. S. A. Exchanged Mar. 17, 1864; bone united; motion imperfect.
287	Smith, R. A., Pt., B, 67th New York, age 45.	June 27, 27, '62.	Right; three inches lower third. Arm useless; amputated Feb. 22, 1863. Disch'd April 14, 1863.
288	Sommars, J. B., Pt., I, 12th Wisconsin.	July 21, 22, '64.	Right; one and a half inches lower third; by Surg. O. B. Ormsby, 45th Illinois. To V. R. C. April 24, 1865.
289	Spencer, J., Pt., G, 103d Ohio, age 23.	June 23, 29, '64.	Left; four inches middle third; by Surg. C. W. McMillen, 1st Tenn. Disch'd April 27, 1865.
290	Stewart, J. F., Pt., B, 110th Penn., age 20.	May 6, 6, '64.	In upper third. Disch'd June 28, 1865.
291	Stewart, W., Pt., C, 23d Indiana.	May 12, 12, '63.	Right. Disch'd July 28, 1864.
292	Stiles, J. R., Pt., G, 148th New York, age 28.	June 18, 18, '64.	Right; three inches upper third. Disch'd June 24, 1865; elbow anchylosed.
293	Stone, A. E., Pt., H, 115th New York, age 21.	Jan. 15, 15, '65.	Left; portion in upper third; by Surg. G. C. Jarvis, 7th Conn. Discharged June 4, 1865.
294	Stone, G. H., Serg't, A, 8th N. Y. H. A., age 21.	June 16, 17, '64.	Left; three inches middle third. Disch'd Mar. 2, 1865; did well.
295	Stone, J., Pt., D, 92d New York, age 24.	June 1, 1, '64.	Left; two inches of upper third. Disch'd Jan. 12, 1865; useful arm. Died Jan. 25, 1874, of pyæmia.
296	Strathdee, G., Pt., A, 100th Illinois, age 28.	Nov. 25, 27, '63.	Left; one and a half inches middle third; amputated Feb. 9, 1864. Disch'd Feb. 5, 1865.
297	Stout, F., Pt., C, 48th New York, age 18.	Feb. 21, 21, '65.	Right; four inches middle third; by Surg. A. D. Palmer, 9th Me. Dis. June 6, 1865; not a pensioner.
298	Tarbell, J., Pt., K, 6th New Hampshire, age 36.	June 28, 28, '64.	Right; injured portion. Duty September 15, 1864.
299	Tathwell, E. E., Pt., A, 96th Ohio, age 18.	Nov. 3, 3, '63.	Right; about two inches lower third; by Asst. Surg. S. McClellan, 13th Conn. Disch'd March 10, 1864; favorable.
300	*Taylor, J. H.*, Pt., G, 8th Alabama, age 28.	June 23, 24, '64.	Right; fractured ends in lower third; by Surgeon of 8th Alabama. Retired September, 1864; good motion of joint.
301	*Thompkins, C. H.*, Pt., B, 38th Virginia.	Jan. 19, 20, '65.	Left, four inches of lower third. Furloughed March 21, 1865.
302	Totten, C., Corp'l, E, 4th Iowa Cavalry, age 25.	Oct. 25, 25, '64.	Right; two inches upper third. Disch'd June 1, 1865; arm entirely useless.
303	Toynton, W., Pt., E, 6th Michigan Cavalry.	Nov. 15, Onfield, 1863.	Right; about three inches upper third. Disch'd Aug. 26, 1864; motion restricted.
304	Van Brunt, A., Pt., C, 9th New York, age 22.	May 10, 11, '64.	Left; three inches upper and middle thirds; by Surg. J. A. Hall, 49th N. Y. Discharged July 14, 1865; ligamentous union.
305	VanValkenburg, E., Corp'l, F, 109th N. Y., age 32.	May 12, 13, '64.	Left; two inches middle third; by Surg. S. S. French, 20th Mich. Disch'd October 3, 1864; some mobility of elbow.
306	*Wall, G. W.*, Capt., C, 24th Mississippi, age 24.	April 6, 7, '65.	Right; three inches middle third. To Fort McHenry May 9, 1865.
307	Watkins, W. H., Serg't, E, 12th Miss. Cavalry, age 30.	Dec. 16, 16, '64.	Right; five inches; by A. A. Surg. A. Rolls, U. S. A. Disch'd April 14, 1865; not a pensioner.
308	Watson, S., Pt., E, 184th Pennsylvania, age 24.	June 3, 3, '64.	Right; at middle third; by Surg. M. Rizer, 72d Penn. Disch'd Feb. 20, 1865; motion recovered, strength not.
309	Welch, J., Pt., B, 6th U. S. Infantry, age 26.	Mar. 18, 20, '65.	Left; five inches upper third; by Act. Asst. Surg. J. E. Semple; amputation at the shoulder joint. Disch'd June 3, 1865; pensioned.
310	Wells, J., Pt., F, 19th U. S. Colored Troops.	July 30, 30, '64.	Right; four inches middle third; by Surg. G. R. Potts, 23d U. S. C. T.; arm amputated August, 1864. Disch'd June 12, 1865.
311	Wentz, H., Pt., F, 112th New York, age 36.	Jan. 15, 15, '65.	Right; three inches upper third; by Asst. Surg. F. B. Kimball, 3d New Hampshire. Disch'd Sept. 6, 1865.
312	*Westmoreland, J. E.*, Pt., I, 59th Virginia, age 25.	April 9, 9, '65.	Left; three inches upper third; by Surg. Hopkins, C. S. A. To Fort McHenry May 9, 1865.
313	*Wheatley, T.*, K, 13th Georgia.	May 4, 4, '63.	Two and a quarter inches lower third; recovering rapidly.
314	Wheeler, W. M., Pt., A, 6th Vermont, age 43.	May 5, 6, '64.	Right; two inches upper third; by Surg. G. T. Stevens, 77th N. Y. Discharged May 6, 1865.
315	Wilson, J., Pt., D, 185th New York, age 36.	Mar. 29, 30, '65.	Left; five inches upper and middle thirds. Discharged June 29, 1865, and pensioned; interspace two inches.
316	Winchell, S., Pt., I, 142d New York, age 30.	Jan. 15, 16, '65.	Left; four inches middle third. Disch'd May 23, 1865; pensioned; arm useless; no bony union. Died September 5, 1873.
317	Winslow, J., Pt., G, 16th Maine, age 19.	June 18, 18, '64.	Left; one inch lower third. Discharged Jan. 2, 1865; no bony union.
318	Wood, F. V., Pt., A, 14th Ohio, age 18.	June 2, 3, '64.	Right; three inches middle third. Discharged January 23, 1865.
319	Woodman, S. W., Pt., C, 2d Mass., age 24.	July 3, 5, '63.	Left; two inches middle third. Disch'd April 19, 1864, and pensioned; can use hand and rotate forearm.
320	Woods, E. D., Corp'l, K, 25th Indiana, age 27.	Oct. 15, 16, '64.	Right; four inches middle third; amputation. Disch'd May, 1865.
321	Young, B. F., Corp'l, A, 1st Maine Cav., age 27.	Oct. 27, 28, '64.	Right; two inches upper third. Discharged June 10, 1865, and pensioned.
322	Young, E., Pt., D, 59th Illinois, age 20.	Dec. 16, 17, '64.	Right; middle third. Discharged July 13, 1865.
323	Young, H., Pt., K, 20th Connecticut, age 29.	Mar. 19, 19, '65.	Left; between upper and middle thirds. Disch'd Nov. 7, 1865; non-union; limb useless.
324	Zerther, C., Pt., I, 63d Pennsylvania.	June 3, 3, '64.	Left; injured portion. Duty July 20, 1864.
325	Zimmerman, C., Serg't, H, 6th Conn., age 30.	Aug. 14, 14, '64.	Left; four inches of upper third; amputated August 21. Disch'd November 18, 1864.
326	Zimmerman, S., Lieut., H, 81st N. Y., age 24.	June 3, 3, '64.	Right; five inches upper third. Discharged September 21, 1864; no bony union.

Of the foregoing list of three hundred and twenty-six operations, two hundred and twenty-six were practised on Union and thirty-one on Confederate soldiers. Two hundred and seventy-six of the men were discharged and pensioned, nineteen returned to duty, thirty-one were exchanged or paroled. Seventeen of the pensioners have died since their discharge—one by drowning, two from phthisis, one from general anasarca, one from pyæmia, and the rest from causes not stated. Unfortunately, no autopsy is recorded in any case. The injuries are reported to have been inflicted by shell-fragments in ten instances,

by grape or canister shot in two, and by small projectiles in three hundred and fourteen cases. The left arm was interested in one hundred and sixty-five, the right in one hundred and forty-seven, and this point was unnoticed in fourteen instances. In two hundred and ninety-four cases in which the seat of excision was precisely defined, the excised portion belonged chiefly to the upper third of the diaphysis in one hundred and twenty-two, to the middle third in one hundred and fourteen, and to the lower third in fifty-eight. The extent of bone excised is specified in two hundred and forty-nine instances, as enumerated in the foot-note.[1] Twenty-seven cases were complicated by other wounds; and, in one case, a leg was amputated, in another, an exsection of the ulnar nerve practised, and, in six, missiles extracted, at the time of excision. Later, exarticulations at the shoulder were thrice resorted to, and amputations of the arm were practised in twenty-four cases. In thirteen instances, consecutive operations for the removal of diseased bone were required:

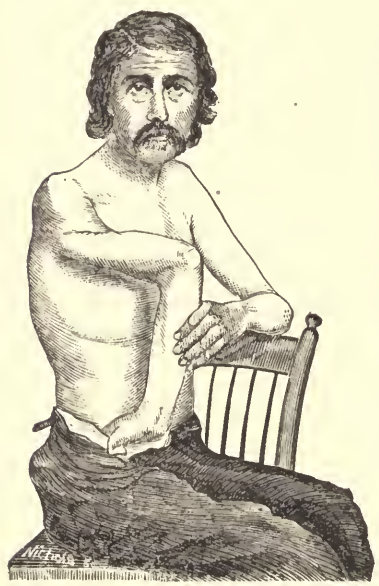

FIG. 506.—Dangling arm after excision in the continuity. [From a photograph.]

CASE 1631.—Private E. P———, Co. B, 46th New York, aged 25 years, was wounded at Petersburg, April 2, 1865. He was admitted into the field hospital of the Ninth Corps. Surgeon M. K. Hogan, U. S. V., recorded "a gunshot fracture of the right arm; resection of two inches of the humerus, by Surgeon D. C. Roundy, 37th Wisconsin." On April 8th, he was transferred to Stanton Hospital, Washington. Surgeon B. B. Wilson, U. S. V., noted: "Compound comminuted fracture of the upper third of the right humerus." On September 19th, he was transferred to Douglas Hospital, whence Assistant Surgeon W. F. Norris, U. S. A., reported: "Gunshot fracture of the right humerus, upper third, by a minié ball. Primary resection of four inches of the shaft of the right humerus. Incision three inches long on the external aspect; chloroform administered. Present condition: All closed except a fistulous opening which leads to the necrosed end of the upper portion of the lower fragment; no union; operation performed on the field; still under treatment." On November 2d, he was transferred to Harewood, whence Surgeon R. B. Bontecou, U. S. V., forwarded a photograph of the patient, which is copied in the wood-cut (FIG. 505), and reported the wound as then healed, but with no bony union." Pornbsky was discharged, on certificate of disability, November 27, 1865, and pensioned. Examiner J. H. Clark, of Newark, New Jersey, July 31, 1867, reported: "Has resection of the right humerus at the upper third of about three inches. The arm, forearm, and hand are of very little service; so little that his inability to perform manual labor is equivalent to the loss of the hand." Examiner C. M. Chamberlain, New York, reported, February 10, 1868: "Six inches of the shaft of the humerus has been resected, and the bone has not been restored. The forearm dangles from the false joint and is atrophied, being of less use than if the injury had been the loss of the hand; disability total." The pensioner has not been heard from since 1870.

CASE 1632.—Corporal S. Gear, Co. H, 49th Ohio, aged 19 years, was wounded at Nashville, December 16, 1864. He was admitted into the hospital of the 3d division, Fourth Army Corps, and on the following day was transferred to Hospital No. 1, Nashville. Surgeon B. B. Breed, U. S. V., reported: "Gunshot fracture of right humerus. Ball entered on anterior aspect of arm in middle third, passed through the humerus, and lodged in the tissues behind it. Resection was performed, on December 16th, of two and a half inches of shaft of humerus, middle third, through an incision three and a half inches long over anterior aspect of arm. Anæsthetic and operator unknown. Wound doing well. Water dressings used, and tonics and stimulants and nutritious diet administered. Patient transferred to Hospital No. 2 on December 22d." Surgeon J. E. Herbst, U. S. V., in charge of the latter hospital, reported: "Gunshot fracture of right humerus. Hæmorrhage from posterior circumflex artery, to amount of ten ounces, occurred on December 26th, caused by gangrene of the wound. The bleeding was discovered early, and the artery was ligated by Acting Assistant Surgeon S. W. Blackwood. Constitutional condition of patient healthy, and improvement rapid." The patient was discharged from service on June 27, 1865, and pensioned. In the certificate of disability for discharge Surgeon Herbst reports: "Gunshot fracture of right humerus, middle third, producing pseudarthrosis and extensive injury of nerves." Examiner J. H. Hair, of Fostoria, Ohio, July 15, 1865, certified: "Ball entered right arm, fracturing humerus, middle third. About three inches of said bone was resected (which wound is still discharging), from which he has lost fully three-fourths the use of right arm." The disability was rated three-fourths. The pensioner died on March 2, 1870. The cause of his death is not known.

§*Fatal Cases.*—One hundred and forty-five, or about one-third of the primary excisions in the continuity, terminated fatally.

[1] Viz: An inch in 7 seven cases; an inch and a half in 9 cases; two inches in 56 cases; two and a half inches in 19 cases; three inches in 71 cases; three and a half inches in 11 cases; four inches in 56 cases; four and a half inches in 1 case; five inches in 16 cases; six inches in 1 case (No. 286); six and a half inches in 1 case (No. 168); eight inches in 1 case (No. 71). In seventy-seven cases this point was not explicitly defined.

TABLE LVII.

Condensed Summary of One Hundred and Forty-five Fatal Primary Excisions of the Shaft of the Humerus for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Arbuckle, R. A., Pt., A, 32d Ohio.	July 21, 21, '61.	Right; two inches middle third; by Surg. A. C. Brundager, 32d Ohio. Died July 19, 1865, of dropsy.
2	Barker, L., Pt., E, 4th Indiana Cavalry.	Jan. 16, 19, '64.	Right; three inches upper third. Died April 26, 1864.
3	Barnard, J. W., Pt., K, 11th Virginia, age 56.	July 2, 3, '63.	Right. Died July 26, 1863, of pyæmia.
4	Batchelder, C.W., Corp'l, D, 13th N. Hampshire.	May 13, 13, '64.	Right; at the middle third. Died July 2, 1864.
5	*Battle, W. L*, Lieut., D, 37th N. Carolina, age 19.	July 2, 3, '63.	Left; three inches upper third. Arm amputated Aug. 23, 1863; died three hours afterward.
6	Beckelshymer, H., Pt., A, 103d Illinois.	July 22, 22, '64.	Left; two inches middle third; by Surg. R. Morris, 103d Illinois. Died Aug. 23, 1864.
7	Bennet, A. S., Pt., C, 2d Ohio Cavalry, age 22.	June 1, 1, '64.	Left; fractured portion. Died July 2, 1864.
8	Black, J., Pt., H, 1st Pennsylvania Reserves.	July 2, 2, '63.	Left; three inches. Died Aug. 15, 1863.
9	Boswell, B. M., Corp'l, E, 111th Illinois.	May 15, 15, '64.	Left; at lower third; by Surg. A. C. Messenger, 57th Ohio. Died May 22, 1864.
10	Boynton, H. E., Pt., 1st Mass. Heavy Artillery, age 18.	May 19, 22, '64.	Right; two inches middle third; by Surg. N. R. Moseley, U. S. V. Died June 22, 1864. *Spec* 2322.
11	Brooke, J., Pt., I, 16th Connecticut, age 19.	Sept. 17, 17, '62.	Left; six inches upper third; by Surg. N. Mayer, 16th Conn. Died Oct. 11, 1862.
12	Buckley, J., Corp'l, G, 9th Mass., age 27.	May 12, 12, '64.	Right; eight inches. Died May 28, 1864.
13	Burke, J., Pt., H, 6th Penn. Cavalry, age 20.	May 8, 9, '64.	Left; amputation June 4, 1864. Died June 5, 1864, of pyæmia. *Spec.* 3550.
14	*Burress, E. B*, Pt., G, 2d South Carolina.	May 23, 24, '64.	Middle third. Died July 12, 1864.
15	Butterfield, S. W., Corp'l, E, 111th Pennsylvania.	July 20, 20, '64.	Right; in lower third. Died Sept. 5, 1864.
16	Byers, W. F., Serg't, A, 57th Indiana.	June 27, 27, '64.	Right; by Surg. E. B. Glick, 40th Indiana. Died July 12, 1864.
17	Campbell, G. W., Pt., K, 36th Wisconsin.	June 18, 18, '64.	Left; in upper third; by Surgeon W. J. Burr, 42d N. Y. Died June 27, 1864.
18	Carman, G., Corp'l, E, 83th Illinois.	Prim'ry. —, '64.	Died June 8, 1864.
19	Charles, R., Pt., A, 19th Maine.	Feb. 5, 5, '65.	Left; in upper third; by Surgeon S. H. Plumb, 82d N. Y. Died February 14, 1865.
20	Chapman, E., Pt., I-D, 75th New York, age 48.	June 14, 14, '63.	Left; greater portion of the shaft. Died July 17, 1863, of pyæmia.

135	Whalen, M., Pt., I, 90th Illinois.	July 28, 28, '64.	Right; by Surg. Halderman, 46th Ohio. Died Aug. 21, 1864.

No.	Name, Age, and Military Description.	Dates.	Operation, Operator, Result.
136	*Williams, T. G.*, F, 31st North Carolina, age 25.	May 16, 16, '64.	Died June 14, 1864, of pyæmia.
137	Williams, S., Pt., E, 140th Pennsylvania.	Oct. 14, 14, '63.	Right. Died November 1, 1863, of pyæmia.
138	Wilson, W., Pt., K, 15th New Jersey, age 23.	Aug. 18, 19, '64.	Left; three inches lower third; by Surg. H. Pearns, 175th N. Y. Died September 4, 1864.
139	Wilburn, L., Pt., A, 68th U. S. Colored Troops, age 30.	April 2, 3, '65.	Left; portion of lower third; arm amputated April 13, 1865. Died April 28, 1865, from hectic fever.
140	Williams, J. J., Pt., K, 73d Indiana.	June 19, 19, '64.	Left; in middle third; by Surg. A. T. Hudson, 26th Iowa. Died July 26, 1864.
141	Wilburn, G., Pt., G, 111th Illinois.	May 14, 14, '64.	Upper third; by Surgeon S. O. Bonner, 47th Ohio. Died May 22, 1864, of erysipelas.
142	Woodbridge, W. O., Pt., C, 4th New Hampshire, age 35.	June 24, 21, '64.	Two inches upper third; by Surg D. Mackay, 34th U. S. C. T. Died July 13, 1864, of tetanus.
143	Wyatt, A., Pt., H., 83d New York, age 26.	May 8, 8, '64.	Left; two inches. Died June 3, 1864, of pyæmia.
144	Young, J., Pt., F, 13th Illinois.	Nov. 27, 27, '64.	Right; in middle third; by Surg. S. C. Plummer, 13th Ill. Died Jan. 14, 1865.
145	Zonna, J., Pt., F, 44th Illinois, age 29.	Nov. 25, 27, '63.	Left; injured portion lower third. Died December 6, 1863, from secondary hæmorrhage.

Some further details are appended of the cases numbered 38, 94, and 108, in the foregoing tabular statement.

Case 1633.—Private H. S. P———, Co. D, 1st Delaware, aged 26 years, was wounded at the Weldon Railroad, August 25, 1864, and was sent to Washington, entering Lincoln Hospital August 28th. Assistant Surgeon J. C. McKee, U. S. A., reported: "Shot fracture of the left humerus, lower third, severe. Excision on the field." Acting Assistant Surgeon A. N. Sherman reported: "Gunshot fracture of left humerus. When the patient was admitted to Ward 14, about January 1st, he was much emaciated, with very irritable stomach. The discharge from the wound was of a dark sanious color, indicating extensive necrosis of bone; his general health would not admit of an operation. Pyæmia appeared to develope itself about fifteen days previous to death, which occurred January 31, 1865." Acting Assistant Surgeon H. M. Dean contributed the specimen (Fig. 507), and reported: "*Post-mortem* January 31, 1865, at 10 A. M.: Body very much emaciated; skin of a sallow color; height five feet five and a half inches; rigor mortis not very well marked; œsophagus, larynx, and trachea healthy; both lungs appeared normal; pericardium normal; heart contained a clot—very pale, otherwise appeared normal; liver very fatty; spleen appeared normal; both kidneys very pale; lining membrane of intestine very pale; right lung weighed nine ounces, left nine and a half ounces; spleen six ounces; heart nine ounces; right kidney six ounces, left six and a half ounces; liver eighty-eight ounces. The left humerus was found to be badly comminuted and necrosed in its middle third, and the tissues surrounding it were of a black color." The specimen, of which a wood-cut (Fig. 507) is annexed, consists of "the left humerus six months after fracture in the lower third. The entire shaft of the bone is occupied by a sequestrum. That in the lower fragment is heavy and nearly detached. The involucrum is wanting on the anterior surface, where it appears to have been absorbed after deposit. The new deposit on the upper fragment is irregular and sparse."

Fig. 507.—Necrosis of left humerus after shot fracture of the lower third. *Spec.* 3652.

Case 1634.—Private G. H. Rich, Co. B, 42d Massachusetts, aged 21 years, was, on August 3, 1864, accidentally shot while on guard duty at the Government docks in Alexandria. He was admitted into Old Hallowell Hospital. Surgeon E. Bentley, U. S. V., recorded: "Gunshot fracture of right humerus by minié ball. Patient was put under the influence of chloroform, and an incision having been made through the deltoid muscle, the fragments of the humerus were taken out and the ends of the bone sawed off, removing altogether about two inches. Operator, Surgeon E. Bentley, U. S. V. Patient reacted and progressed well until August 13th, when, at 3 P. M., he was taken with a chill, and bleeding commenced immediately from the wound. The loss of blood amounted to sixteen ounces before it was arrested by pressure on the subclavian artery. The pulse after this was small and very indistinct at the wrist; stomach rejecting everything introduced. Patient continued to sink, and died at 4 P. M. on August 14, 1864."

Case 1635.—Private J. N. Gladding, Co. F, 7th Rhode Island, aged 20 years, was wounded, at Bethesda Church, June 3, 1864. He was admitted into the 2d division hospital, Ninth Army Corps. Surgeon J. Harris, 7th Rhode Island, recorded: "Gunshot fracture of arm; resection; transferred to White House." On June 7th, the patient reached Washington, where he was admitted into Mount Pleasant Hospital. Assistant Surgeon C. A. McCall, U. S. A., reported: "Gunshot wound, causing comminuted fracture of middle third of right humerus. Resection of about two and a half inches of the shaft at middle third performed on day of injury, through an incision four inches long. Operator, Surgeon J. Harris, 7th Rhode Island. On admission the arm was much swollen and erysipelatous. Muriated tincture of iron was prescribed in doses of fifteen drops every four hours. By June 15th, erysipelas had disappeared and the wound was suppurating freely. On June 18th, pyæmia began to develope, of which the patient died, on July 3, 1864."

The excisions were practised on one hundred and thirty Union and fifteen Confederate soldiers. Of one hundred and twenty-seven operations, sixty-one were on the right and sixty-six on the left side, this point being unspecified in eighteen cases. Thirty-six excisions were mainly in the upper, thirty-four in the middle, and sixteen in the lower third; in fifty-nine cases, the extent and situation of excision could only be surmised. Fifteen of the patients had other serious wounds, one undergoing amputation of the right great toe,

another amputation at the ankle by Syme's method, a third exarticulation of the opposite arm. Twenty-five were subjected to consecutive major operations, nine to exarticulations at the shoulder, fifteen to amputations of the arm, and one to excision in the fibula. Pyæmia was by far the most frequent cause of death, although there were twenty-two instances of consecutive hæmorrhage. Eleven pathological specimens are preserved.

§ *Primary Operations, in which the Results could not be definitely ascertained.*—Sixteen cases could not be traced to their termination; although there is reason to believe that a majority of them progressed favorably.

TABLE LVIII.

Condensed Summary of Sixteen Cases of Primary Excisions in the Shaft of the Humerus after Shot Injury, in which the Results could not be determined.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	*Beahan, B. F.*, Pt., H, 33d Virginia, age 19.	May 3, 5, '63.	Right; resection of three and a half inches of shaft.	9	*P——*, C. S. A.....	May 28, 28, '64.	Excision of two inches of middle third; cartilaginous union; limb not materially impaired.
2	*Byers, G.*, Pt., A, 6th Ky., age 21.	Sept. 20, 20, '63.	Left; lower and upper third shattered; resection of one inch from end of each portion; October 1st, doing well.	10	*Rabb, J. W.*, Serg't, D, 9th Louisiana, age 19.	May 4, 4, '63.	Fracture near surgical neck; partially resected.
3	*Culbott, J. A.*, Pt., C, 9th Louisiana, age 25.	May 4, 4, '63.	Two inches resected in lower third.	11	*Raben, J.*, Pt., E, 42d North Carolina.	May 21, 21, '64.	Resection of entire lower third; July 1st, improving rapidly.
4	*Graham, W.*, Pt., D, 13th Georgia.	Sept. 21, 21, '64.	Right; resection of upper third.	12	*Reffey, G.*, Pt., B, 40th Georgia.	Mar. –, 1865, On field.	Excision of fractured portion of upper third; progress favorable.
5	*Higgins, C.*, Pt., C, 41st Mississippi.	Sept. 20, 20, '63.	Excision of middle third.	13	*Shannan, A. J.*, Pt., F, 35th North Carolina.	April 20, 20, '64.	Left; excision of three inches of middle third, by C. H. Ladd, C. S. A.; fair prospect of recovery.
6	Huber, J., Pt., F, 2d U. S. Artillery.	Aug. 25, 25, '64.	Right; excision of humerus, by Surgeon N. Gay, U. S. V.; not a pensioner.	14	*Sheppard, R. F.*, Pt., C, 4th Virginia.	May 3, 5, '64.	Resection of four inches.
7	*McDonald, T. K.*, Pt., D, 60th Georgia.	May 4, 4, '63.	Right; excision of two inches at surg. neck; Aug. 1st, gangrene in cicatrix; April 1, '64, nearly well.	15	*Watts, E. C.*, Pt., H, 8th North Carolina.	April 20, 20, '64.	Right; one and a half inches of middle third; by C. H. Ladd, C. S. A.; doing well May 5th.
8	*Mc——, R.*, C. S. A.....	July 28, 29, '64.	Excision of four inches of upper third, by Asst. Surg. B. S. Barnes, 46th Tennessee.	16	*Wilkinson, J. A.*, Pt., K, 44th Tennessee, age 22.	May 16, 18, '64.	Right; excision of part of upper third; doing well.

Intermediary Excisions in the Shaft of the Humerus.—Ninety-three excisions are comprised in this category, twenty-nine with fatal results.

§ *Recovery after Intermediary Excisions in the Shaft of the Humerus.*—The percentage of recovery in these operations was 68.9 per cent. A detailed example is given:[1]

CASE 1636.—Private T. K——, Co. C, 107th Pennsylvania, aged 17 years, was wounded at Antietam, September 17, 1862. Acting Assistant Surgeon J. Sweet reported, from Hospital No. 1, Frederick: "He was admitted, on September 25th, with compound shot fracture of the left humerus. Resection of two inches was performed on the following day; splints were applied to the arm. On December 6th, the patient had almost recovered and was ready to be discharged." Dr. Sweet contributed the specimen (FIG. 508), which consists of "several fragments, representing three and a half inches of the length and one-third of the circumference of the shaft of the humerus" (*Cat. Surg. Sect.*, 1866, p. 133). On April 18th, the patient was transferred and admitted to Broad and Cherry Streets Hospital, Philadelphia, and, on June 22d, to Turner's Lane Hospital. Assistant Surgeon C. H. Alden, U. S. A., noted: "Gunshot fracture of left arm, resection of humerus before admission." On August 12th, he was admitted to Haddington Hospital, where Acting Assistant Surgeon G. H. Mitchell noted: "Gunshot fracture of humerus, lower third." The patient was assigned to the Veteran Reserve Corps on May 3, 1864, and discharged from service October 26, 1864. Examiner C. H. Davis, of Tunkhannock, Pennsylvania, certifies, July 17, 1867: "The ball entered the outside of the arm and passed directly through, carrying a portion of the humerus. The operation of resection was performed, shortening the limb from two to three inches. There are extensive cicatrices on both sides of the arm and outer side; the integuments are calloused and adherent to the bone. The parts are very tender. He has no use of the forearm. He can produce very slight flexion of the elbow; no use of the muscles of the wrist or fingers." Examiner J. S. Crawford, of Williamsport, Pennsylvania, reported, September 6, 1873: "Caries followed the resection; the openings are now healed, but the cicatrices are tender and will open again. There is partial anchylosis of the elbow. The muscles of the arm are so injured and destroyed at the wound and by the suppuration that followed that they are entirely useless. His arm hangs at his side entirely useless, and is atrophied to a great extent. The arm is completely useless." The disability is rated total. Has been paid pension to March 4, 1875.

FIG. 508.—Excised fragments of humerus. *Spec.* 821. ½.

[1] Dr. WILLIAM GILFILLAN (*Transactions of the Medical Society of the State of New York*, 1866, p. 122) gives an interesting history, with a good plate, of the case enumerated as 23 in the TABLE.

TABLE LIX.

Condensed Summary of Sixty-four Cases of Recovery after Intermediary Excisions of the Shaft of the Humerus for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Arnold, D. E., Pt., G, 72d New York.	May 5, 10, '62.	Right; three inches of middle third. Discharged May 14, 1863; pensioned.
2	Baker, J., Pt., C, 6th Md., age 20.	Nov. 27, Dec. 1, 1863.	Right; three inches of middle third. Discharged April 29, 1864; pensioned.
3	Balfe, J. E., Lieut. Col., 35th Indiana, age 25.	Dec. 9, 22, '62.	Left; three and a quarter inches upper third; considerable union of bone. Resigned April 11, 1864; pensioned.
4	*Bennet, J. D.*, Pt., B, 13th S. C., age 20.	April 2, 10, '65.	Left; two inches at middle third. Sent to Fort McHenry May 9, 1865.
5	Bentley, C. M., Capt., H, 2d N. Y. Cav., age 27.	April 4, 16, '64.	Right; two inches of lower third; A. A. Surg. J. C. Lee; shortened two inches; bony union; little power in arm. Mustered out Nov. 8, '64; pension'd; died Sept. 3, '66.
6	Black, J. C., Lieut. Col., 37th Illinois, age 24.	Dec. 7, 18, '62.	Left; excision of ends of bone in middle third, by Surgeon E. A. Clark, 37th Ill. Resigned Aug. 15, 1865; pensioned.
7	*Bollinger, J.*, Pt., A, 1st Maryland.	July 3, 10, '63.	Left; excision of injured portion in middle third; perfect union of bone. Paroled.
8	Burke, J. L., Serg't, E, 165th N. Y., age 25.	April 9, 15, '64.	Right; two and a half inches of upper third; by A. A. Surg. J. C. Lee; continuity above condyle removed, by A. A. Surg. Ferguson. Discharged July 15, 1864; pensioned. Two false joints; elbow joint anchylosed; complex arm and forearm with apparatus.
9	Callender, J., Pt., A, 5th Colored Troops, age 32.	Sept. 29, Oct. 3, 1864.	Right; four and a half inches in upper third; by Asst. Surg. J. H. Frantz, U. S. A. Discharged June 22, 1865; pensioned. A. M. M., *Spec.* 2416.
10	Chitty, H. E., Serg't, H, 10th Conn., age 32.	Dec. 14, 1862, Jan. 12, 1863.	Left; one and a quarter inches of middle third; by A. A. Surg. T. B. Upham. Duty March 27, 1863; resigned as lieutenant Sept. 20, 1864; pensioned.
11	Cleverton, J. S., Pt., B, 5th Ohio, age 22.	Nov. 27, Dec. 2, 1863.	Right; three and a half inches at junction of upper with middle thirds; false joint but useful limb. Discharged Feb. 25, 1865; pensioned.
12	Chase, D. W., Pt., D, 36th Massachusetts, age 21.	June 3, 18, '64.	Left; three inches of shaft; by Surg. H. Palmer, U. S. V. Discharged June 22, '65; pensioned; arm amputated at upper third, by Dr. A. R. Gleason.
13	Coleman, H., Musician, A, 5th Ohio, age 22.	Aug. 9, 13, '62.	Left; two and a half inches at middle third; by Surg. A. Ball, 5th Ohio. Discharged Nov. 13, 1862; pensioned.
14	Collins, W. W., Corp'l, F, 1st Michigan.	Aug. 30, Sept. 2, 1862.	Left; two and a half inches at junction of lower and middle thirds. Disch'd March 11, 1863; pensioned. *Spec.* 145.
15	Crist, J. M., Pt., H, 124th New York, age 20.	May 3, 10, '63.	Right; four and a half inches of shaft one and a half inches from elbow joint. Disch'd Oct. 18, 1863; pensioned.
16	*Daggs, J. R.*, Pt., D, 24th Texas, age 20.	Sept. 29, Oct. 7, 1863.	Left; resection in lower third; gangrene, Oct. 29th. Nov. 30th, doing well.
17	Davidson, E., Pt., F, 121st Ohio, age 15.	June 27, July 11, 1864.	Right; two inches of upper third; by A. A. Surg. J. W. Digby. Disch'd Dec. 26, 1864; pensioned.
18	Devereux, W. H., Pt., F, 9th N. Y. Cav., age 24.	June 21, 25, '64.	Right; three inches middle third; by O. A. Judson, U. S. V. Discharged June 23, '65; pensioned.
19	Dittman, R., Corp'l, E, 14th Infantry, age 29.	Aug. 18, 28, '64.	Right; four inches at upper and middle thirds, by A. A. Surg. W. C. Mulford; ends of bone firmly united. Disch'd Oct. 2, 1864; pensioned. *Spec.* 3554.
20	Dougherty, G. W., Pt., C, 77th Penn., age 17.	June 25, 29, '63.	Left; fragments removed and fractured ends sawn off, by Surg. I. Moses, U. S. V.; bony union. Duty Aug. 1, 1864; disch'd Oct. 11, 1864; pensioned. *Spec.* 1754.
21	Dunton, A. M., Pt., D, 124th Illinois, age 20.	June 26, 30, '63.	Left; two inches of upper third; by Surg. J. S. Reese, 68th Ohio. Disch'd Oct. 27, 1864; pensioned.
22	Fausel, C., Corp'l, A, 50th Illinois, age 27.	April 6, 10, '62.	Left; four inches; by Surg. H. W. Kendall, 50th Ill. July, 1862, ends of bone sawn off. Disch'd Oct. 13, 1862; pensioned.
23	Franz, W., Pt., F, 132d Penn., age 20.	Sept. 17, 27, '62.	Left; six inches of shaft of upper third; by Surg. G. Grant, U. S. V. Disch'd Dec. 12, 1862; pensioned. *Spec.* 814.
24	George, J. N., Serg't, E, 72d Illinois, age 27.	Nov. 30, Dec. 10, 1864.	Right; three inches of upper third; by A. A. Surg. J. H. McIntyre. Disch'd June 6, 1865; pensioned. Died July 16, 1873, of erysipelas from injury to arm.
25	Gleason, P., Pt., H, 5th New York, age 21.	Aug. 31, Sept. —, 1862.	Right; in lower third, by Surg. T. Crosby, U. S. V. Discharged Dec. 26, 1862. Elbow joint anchylosed; false joint; pensioned. Died July 6, 1873, of phthisis.
26	Gleeson, J., Pt., G., 14th Infantry, age 28.	June 27, July 23, 1862.	Left; four inches; by Dr. Gilfillan. Disch'd Feb. 9, 1864; pensioned. Nine operations for removal of bone performed; free use of elbow joint and shoulder.
27	Glenn, D. M., Corp'l, K, 1st Penn. Rifles, age 21.	Dec. 13, 17, '62.	Right; three and a half inches at middle third; amputation at upper third. V. R. C. Sept. 9, 1863; pensioned. *Spec.* 1066.
28	Hall, J. H., Pt., A, 9th Maine, age 23.	Sept 29, Oct. 3, 1864.	Left; two inches middle third. Discharged June 17, 1865; pensioned.
29	Hance, I., Pt., F, 14th New Jersey, age 18.	May 30, June 6, 1864.	Right; removal of fragments and ends sawn off, by Surg. N. R. Moseley, U. S. V. Deserted Aug. 24, 1864; not pensioned. *Spec.* 2505.
30	Herman, A., Pt., C, 48th New York, age 42.	Feb. 20, Mar. 9, 1864.	Right; four inches of upper third; by A. A. Surg. J. T. Kennedy; partial union; bids fair to make a useful arm. Discharged Oct. 3, 1865; pensioned.
31	Horton, E., Pt., I, 1st Wis., age 29.	May 26, June 9, 1864.	Left; by Asst. Surg. C. C. Byrne, U. S. A. Disch'd April 8, 1865, and pensioned.
32	Jarvis, W. D., Pt., D, 98th Ohio, age 23.	Oct. 8, 16, '62.	Left; upper third to surgical neck; by A. A. Surgeon A. S. Green. Disch'd Jan. 22, 1863; useful arm; pensioned. *Spec.* 340.
33	Johnston, D., Pt., F, 103d Penn., age 23.	Dec. 14, 1862, Jan. 13, 1863.	Right; two and a half inches lower third; no union; arm amputated. Discharged Nov. 25, 1863; pensioned.
34	Keeney, Alexander, Pt., F, 141st Penn., age 30.	July 2, 8, '63.	Left; three inches middle third; by A. A. Surg. H. Leeman. To V. R. C. Sept. 17, 1864; bone ununited; pensioned.
35	Kinsley, T., Pt., C, 107th Penn., age 17.	Sept. 17, 26, '62.	Left; two inches; by A. A. Surg. I. Sweet. To V. R. C. May 3, 1864; pensioned. *Spec.* 821.
36	Landgrove, J. M., Pt., A, 15th Wisconsin, age 18.	May 27, June 3, 1864.	Left; two and a half inches middle third; by Surg. S. B. Hawley, 35th Illinois. Disch'd Dec. 17, 1864; union. Not a pensioner.
37	*Long, G. B.*, 2d Lieut., F, 11th Virginia, age 24.	July 3, 15, '63.	Right; three inches upper third; by A. A. Surg. B. F. Butcher. To Fort McHenry Nov. 12, 1863; recovered.
38	Loyd, M., Pt., F, 100th Pennsylvania, age 23.	Mar. 25, April 24, 1865.	Right; three inches upper third; by Surg. G. L. Pancoast, U. S. V. Discharged July 24, 1865; pensioned. *Spec.* 4282.
39	Maynard, H., Pt., C, 7th New Hampshire, age 31.	Feb. 20, Mar. 9, 1864.	Right; five inches lower third; by A. A. Surg. W. Balser. Discharged September 7, 1864; pensioned. Arm nearly as strong as the other. Died March 15, 1872.
40	McAllister, J. A., Pt., I, 149th New York, age 24.	Nov. 24, Dec. 7, 1863.	Right; three inches middle third; by Surg. I. Moses, U. S. V. Discharged Jan. 26, 1865; pensioned; useful hands. *Spec.* 2143.
41	McCully, A. S., Corp'l, C, 2d Penn. Reserves, age 20.	Dec. 13, 19, '62.	Right; four inches lower third; by Surg. E. Donnelly, 2d Penn. Reserves. To V. R. C. Feb. 24, 1864; pensioned; anchylosis.
42	McCullough, D. G., Pt., A, 54th Penn., age 24.	May 15, 22, '64.	Left; two inches of shaft; by Surgeon J. B. Lewis, U. S. V. Discharged Jan. 31, 1865; pensioned; bone united.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
43	McKeever, J. E., Serg't, G, 101st Ohio, age 22.	Oct. 8, 21, '62.	Right; four inches lower third; by A. A. Surgeon N. M. Elrod. Discharged Jan. 1, 1863; pensioned; useful arm. *Spec.* 339.
44	Miller, R. R., Corp'l, D, 4th Minnesota.	May 22, June 3, 1863.	Right; five inches middle third. Disch'd Oct. 22, 1863, and pensioned; arm amp. in Oct., 1865.
45	Patton, G., Pt., I, 86th Indiana, age 23.	May 27, June 17, 1864.	Left; four inches upper and middle thirds; by Asst. Surg. C. C. Byrne, U. S. A. Disch'd Dec. 7, 1864, and pensioned.
46	Peet, C. C., Corp'l, F, 121st New York.	May 3, 11, '63.	Right; five and a half inches from one-half inch below surgical neck to three inches above condyles. Disch'd Dec. 12, 1863, and pensioned.
47	Potter, N. F., Serg't, E, 149th New York, age 36.	Nov. 24, Dec. 7, 1863.	Right; three inches upper third; by Surgeon I. Moses, U. S. V. Disch'd July 22, 1864; pensioned; loss of use of arm. *Spec.* 2142.
48	Rechel, C., Pt., G, 34th Ohio, age 22.	July 24, 29, '64.	Right; fractured ends at junction of upper and middle thirds; by Surg. J. B. Lewis, U. S. V. Discharged Nov. 7, 1864; pensioned; bone ununited.
49	Smith, A., Pt., A, 9th N. Y. Heavy Artillery.	July 9, 17, '64.	Right; four inches middle third; by A. A. Surg. P. Middleton; arm amputated. Disch'd March 31, 1865, and pensioned.
50	Spray, J. C., Serg't, G, 71st Ohio, age 28.	Dec. 16, '64, Jan. 10, '65.	Right; two inches upper third; by Surg. J. H. Grove, U. S. V.; amputated. Disch'd May 16, 1865, and pensioned.
51	Stahl, W., Pt., D., 150th Penn., age 26.	July 1, 20, '63.	Left; two large fragments at junction of middle and lower thirds; by A. A. Surg. W. V. Keating, Disch'd June 17, 1865; pensioned; union firm.
52	Stevenson, J. V., Serg't, E, 96th Ohio, age 31.	April 8, 12, '64.	Left; three inches lower end of upper third. Disch'd July 31, 1865; pensioned; paralysis.
53	Swann, W. W., Pt., G, 17th Michigan, age 24.	Sept. 14, 27, 62.	Right; three inches lower third. Disch'd July 1, 1863; pensioned.
54	Swope, B., Pt., I, 6th Michigan Artillery.	May 27, June 2, 1863.	Right; five inches upper third; by Ass't Surg. G. W. Avery, 9th Conn. Disch'd Sept. 7, 1863; pensioned; union firm.
55	Terwilleger, H., Pt., G, 46th Penn., age 20.	May 25, 29, '64.	Left; five inches middle third; by Surg. E. L. Bissel, 5th Conn. Disch'd Aug. 21, 1865; pensioned.
56	Thompson, P. A., Pt., H, 16th U. S. Infantry.	Dec. 31, '62, Jan. —, '63.	Right; four inches upper third. Disch'd April 3, 1863, and pensioned.
57	Trott, S. T., Pt., K, 19th Maine, age 18.	Nov. 8, 18, '64.	Left; three inches upper third; by A. A. Surg. A. Ansell. Disch'd June 23, 1865, and pensioned.
58	*Walker, J.*, Pt., C, 25th Texas, age 24.	Nov. 30, Dec. 27, 1864.	Right; one and a half inches middle third; by A. A. Surg. L. Sinclair. To Provost Marshal May 6, 1865.
59	Ward, W. M., Sergeant, Sharpshooter, 2d Mass.	July 2, 7, '63.	Right; three and a half inches middle third. Duty Dec. 15, 1863; pensioned; bone ununited.
60	Warren, W. H., Corp'l, H, 20th Mass., age 22.	Sept. 17, Oct. 11, 1862.	Right; two inches middle third; arm amputated Oct. 19, 1862. Disch'd Jan. 10, 1863, and pensioned. *Spec.* 273.
61	Wellington, B., Pt., C, 93d Penn., age 18.	Mar. 25, April 7, 1865.	Right; three inches upper third; by Surg. G. L. Pancoast, U. S. V. Disch'd Aug. 1, 1865; not a pensioner.
62	Whalen, W., Pt., F, 2d U. S. Cavalry, age 34.	Sept. 19, 23, '64.	Left; four inches upper third; by Ass't Surg. D. C. Beebe, 4th N. Y. Cav. Disch'd April 17, 1865; pensioned; bone ununited.
63	Wiggin, A., Pt., A. 36th U. S. Colored Troops, age 40.	Sept. 29, Oct. 3, 1864.	Left; four inches upper third; by Ass't Surg. J. H. Frantz, U. S. A. Disch'd Dec. 14, 1865; pensioned; arm amputated. *Spec.* 3012.
64	Wood, W., Pt., K, 10th New York Cav., age 29.	Dec. 10, 23, '64.	Left; four inches middle third; by A. A. Surg. A. Ansell. Disch'd June 16, 1865, and pensioned.

The operations were on fifty-nine Union and five Confederate soldiers. Eight amputations and nine other serious consecutive operations were practised. Thirty-five operations were on the right, and twenty-nine on the left arm. The operations in the middle and upper thirds were the most numerous.

§ *Intermediary Fatal Excisions.*—Twenty-nine, or 31.1 per cent., of the intermediary operations had a fatal result.

Table LX.

Condensed Summary of Twenty-nine Fatal Intermediary Excisions of the Shaft of the Humerus for Shot Injury.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Beaver, T., Pt., H, 2d Wisconsin, age 30.	Aug. 27, Sept. –, 1862.	Right; fragments from lower and middle thirds; by Ass't Surg. P. Adolphus, U. S. A. Died Sept. 17, 1862, of hæmorrhage.
2	Berkey, E. H., Pt., C, 142d Penn., age 25.	Dec. 13, 19, '62.	Left; one and a half inches middle third. Died Jan. 15, 1863. *Spec.* 684.
3	Brehl, H., Pt., A, 44th New York, age 45.	July 2, 7, '63.	Left. Died August 1, 1863, of pyæmia.
4	Carpenter, C. W., Corp'l, I, 95th Illinois, age 20.	June 10, July 2, 1864.	Right; four inches upper third; by A. A. Surg. C. H. Wade. Died July 10, 1864, of pyæmia.
5	Carrier, M. H., Serg't, E, 25th Connecticut.	May 27, June 8, 1863.	Right; fractured portion; by Surg. S. H. Plumb, 82d New York. Died June 15, 1863, from exhaustion; other wounds.
6	Chandler, S., Pt., B, 9th U. S. C. T., age 30.	Sept. 29, Oct. 5, 1864.	Right; eight inches; by Assistant Surgeon D. R. Brown, U. S. V. Died Oct. 18, 1864, from exhaustion.
7	Clements, W. T. C., Corp'l, C, 28th U. S. C. T., age 25.	June 23, July 1, 1864.	Left; five inches upper third; by Ass't Surg. S. B. Ward, U. S. V. Died July 4, 1864, of pyæmia.
8	*Dudding, J. O.*, Pt., C, 28th Virginia, age 33.	July 3, 8, '63.	Right. Died Sept. 13, 1863, of tetanus.
9	Evans, A. R., Pt., A, 5th Michigan Cav., age 40.	July 2, 6, '63.	Right; two inches middle third. Died July 16, 1863, of pyæmia.
10	Finleyson, A., Pt., K, 2d New York Cavalry.	April 7, 18, '64.	Right; three inches upper third; by A. A. Surgeon J. C. Lee, U. S. A. Died April 20, 1864, of pyæmia.
11	Fiselbrand, M., Pt., B, 149th N. Y., age 22.	May 3, 15, '63.	Right; three inches middle and lower thirds; by Surg. C. H. Lord, 102d N. Y. Died June 4, 1863, of pyæmia. *Spec.* 1150.
12	Gallagher, C., Pt., C, 169th New York, age 32.	June 1, 6, '64.	Right; two inches upper third; disarticulation at shoulder joint. Died Mar. 3, 1865, of phthisis. *Specs.* 3698, 383.
13	George, N., Pt., B, 47th Pennsylvania.	Oct. 22, 27, '62.	Right; four inches lower third; by A. A. Surg. T. T. Smiley, Died Nov. 13, 1862, of pyæmia.
14	Geyer, H., Pt., A, 68th New York, age 23.	Aug. 29, Sept. 18, 1862.	Right; two pieces, each three-fourths of an inch in length, from junction of upper and middle thirds; by A. A. Surgeon J. O. French. Died October 18, 1862. *Spec.* 146.
15	Gray, J. C., Pt., D, 63d Penn., age 24.	May 3, 9, '63.	Left; 5½ inches middle third. Died May 21, 1863, of pyæmia.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
16	Hawkins, T. J., Pt., B, 2d U. S. Sharpshooters, age 29.	May 6, 15, '64.	Right; about four inches: by A. A. Surg. F. W. Kelly. Died June 1, 1864, from complications.
17	Lansdown, A. K., Pt., H, 51st Illinois, age 21.	Nov. 30, Dec. 6, 1864.	Right; two inches upper third; by a Confederate surgeon. Died Jan. 4, 1865, of pneumonia.
18	*Lee, J.*, Pt., I, 29th North Carolina, age 24.	April 8, 15, '65.	Left; four inches lower third; by Ass't Surg. E. McClintock, U. S. V. Died May 2, 1865, of typhoid pneumonia.
19	Merritt, E. F., Pt., F, 34th Illinois.	Jan. 1, 17, '63.	Right; arm amputated. Died Feb. 26, 1863.
20	Miner, I. D., Pt., A, 5th Michigan, age 19.	May 5, 19, '62.	Right; three inches middle third; by Surg. —— ——, 5th Mich. Died July 11, 1862.
21	*Nicholas, W.*, Pt., H, 40th Alabama, age 22.	June 13, 26, '64.	Left; two inches upper and middle thirds; by Ass't Surg. G. W. Burke, 40th Penn. Died Oct. 31, 1864.
22	Oliver, H., Pt., F, 36th Ohio, age 18.	July 24, 30, '64.	Left; two and a half inches middle third; by A. A. Surg. J. H. Barthолf. Died Aug. 18, 1864. of pyæmia. *Spec.* 3906.
23	Perkins, J. R., Pt., A, 121st New York.	May 3, 15, '63.	Right; three inches upper third; by A. A. Surg. A. E. Keyes. Died May 30, 1863, of pyæmia.
24	Sankey, M. A., Pt., I, 103d Penn., age 18.	Dec. 14, 27, '62.	Right; three and a half inches middle third; by Surgeon C. A. Cougill, U. S. A.; disarticulation at shoulder joint Jan. 8, 1863. Died Jan. 8, 1863, of pyæmia. *Spec.* 1327.
25	Shaffer, A., Pt., B, 4th Iowa Cavalry, age 18.	Dec. 14, 1864, Jan. 7, 1865.	Left; lower third; by Ass't Surg. J. M. Study, U. S. V. Died Jan. 15, 1865, of typhoid fever.
26	Shober, J., Pt., C, 14th New York, age 26.	July 1, 26, '62.	Left; one inch upper third; by A. A. Surg. D. Kennedy; four ins. of shaft at junction of middle and upper thirds removed Jan. 26, 1863. Died Feb'y 7, 1863, of chronic diarrhœa and pneumonia.
27	Simmons, T., Corp'l, A, 20th Connecticut.	July 3, 20, '63.	Right; by Surg. W. S. Heath, 2d Mass. Died July 23, 1863.
28	Sullivane, D., Pt., A 28th Massachusetts, age 20.	Mar. 25, April 4, 1865.	Right; four inches at middle third; by Ass't Surg. H. Allen, U. S. A. Died April 26, 1865, of pyæmia.
29	Wilds, J. Q., Lieut. Col., 24th Iowa.	Oct. 19, Nov. 5, 1864.	Left; two inches middle third; by Ass't Surg. J. Homans, jr., U. S. A. Died November 19, 1864, from exhaustion.

Twenty-six Union and three Confederate soldiers are enumerated in this series. Nineteen of the operations were on the right, and ten on the left arm. The usual predominance of operations in the middle and upper thirds obtained. Pyæmia and hæmorrhage were the principal causes of death; one patient succumbed from tetanus. Eight cases furnished specimens to the Museum. There were six major consecutive operations, including two exarticulations at the shoulder. An account of one of them is subjoined:

Case 1637.—Private C. Gallagher, Co. C, 169th New York, was wounded at Cold Harbor, June 1, 1864. Surgeon S. A. Richardson, 13th New Hampshire, reported, from the base hospital of the Eighteenth Corps: "Shot wound of right shoulder." On June 8th, he was transferred to the Methodist Church Hospital, Alexandria. Surgeon T. R. Spencer, U. S. V., reported: "Shot wound of right arm, upper third. Ball entered anterior margin of deltoid muscle, fracturing the humerus. Resection on field. Transferred to Albany, September 27, 1864. Acting Assistant Surgeon O. H. Young reported: "Wounded June 1, 1864, by a ball passing through and fracturing the upper third of the humerus. On June 6th, in a hospital at White House Landing, exsection was performed, about two and a half inches of the humerus being removed, beginning about an inch below the surgical neck. A day or two afterward he was removed to the Methodist Church Hospital in Alexandria. He was admitted to this hospital September 27th. At this time he was anæmic, and had a constant and very troublesome cough. There were three sinuses in his arm, which discharged large quantities of pus. Exploration with the probe showed the entire shaft of the bone to be carious, and in some places necrosed. His appetite failed; he was restless and anxious, and his general health continued to fail until it became evident that he could not recover unless the arm were amputated. Accordingly, on January 12, 1865, the operation was performed by Acting Assistant Surgeon Henry Pearce. The head of the bone was carefully disarticulated, and, last of all, the inner flap was made. Scarcely any blood was lost, and the patient appeared quite as strong as he was before the operation. He continued to improve daily, and, on January 19th, was in excellent condition. The wound has apparently healed by the first intention, and his general health is better." Dr. Young also forwarded the specimen (Fig. 509), which consists of "the right humerus amputated at the shoulder joint for necrosis of the shaft after excision of two and a half inches of the upper third. The upper extremity is somewhat rounded, but spongy. A large sequestrum, around which there is an exceedingly imperfect and scanty involucrum, occupies nearly the entire shaft." (*Cat. Surg. Sect.*, 1865, p. 112.) Assistant Surgeon J. H. Armsby, U. S. V., subsequently reported that the wound seemed to do well after the operation, but the general health continued to fail. The symptoms of phthisis progressed rapidly until death, which occurred March 3, 1865." Dr. Armsby contributed a cast in the case (Fig. 510). "There is great emaciation, causing remarkable prominence of the anterior border and head of the scapula. The cicatrix is nearly linear, extending downward from the acromial process into the deep hollow underneath." (*Cat., op. cit.*, p. 547.) This is one of many instances in which, could the end have been foreseen, primary exarticulation would have been regarded as the preferable and most truly conservative operation.

Fig. 509.—Necrosis of the humerus after excision for shot injury. *Spec.* 3908.

Fig. 510.—Cast from a case of exarticulation following a secondary excision of the shaft of the humerus. *Spec.* 383.

Secondary Excisions in the Shaft of the Humerus. — Forty-one examples were reported in this category, with a very low rate of mortality.

§ *Cases of Recovery.*—Thirty-six of the patients who underwent this operation recovered. A few detailed illustrations will precede the table:

Case 1638.—Private P. Murray, Co. H, 70th New York, aged 20 years, was wounded at Williamsburg, May 5, 1862, and was admitted to Chesapeake Hospital, Fort Monroe, on the 9th. Here the patient states resection was performed by Surgeon R. B. Bontecou, U. S. V. He was sent north on the 22d, and was treated in the Twenty-second and Wood Streets Hospital, Philadelphia, until January, 1863, when he was transferred to Sixteenth and Filbert Streets Hospital. Acting Assistant Surgeon A. D. Hall made the following special report: "While not more than fifty yards from the enemy this man was struck by two minié bullets, which entered the outer side of the upper third of the left arm about three and a half inches apart, in a line parallel with the humerus; the upper one passed entirely through behind the bone, the other striking and comminuting the bone to such a degree as to render it a comminuted fracture, at the same time that it became arrested among the fragments, where it remained about two months, when it was removed, together with eight fragments of bone, the patient being at the time at Fort Monroe, to which place he was taken immediately after receiving his wounds. In the following July he was transferred to Philadelphia and taken to the Twenty-second and Wood Streets Hospital, where he remained under treatment until February 1, 1863, when he was brought to this house with a number of others. The wounds of entrance and exit of the upper ball, at this time, were healed entirely, while there were two orifices communicating with the carious cavity of the lower wound, one on the outer side, where the ball entered, the other on the inside, the result of an abscess; from these there was considerable discharge of pus. The wound was dressed with simple cerate, and the arm supported by a proper splint and roller. This treatment was continued, and the administration of tonics commenced. On exploration with a probe, it was found that there existed in the cavity of the lower wound considerable dead bone, which, upon consultation, it was decided to remove. Accordingly, on the 21st instant, at half past ten o'clock, the patient being in excellent condition, ether was given, and the operation commenced. An incision, about five inches in length, was made on the anterior and outer side of the arm in the line of the cicatrix; it was carried down to the bone and parallel with its axis. The fragments were found to be imperfectly united, as there was fibrous instead of bony union, and, as a consequence, motion existed to a certain extent between them. One piece of bone, three-fourths of an inch in length by half an inch in breadth, was removed. The hæmorrhage during operation was slight, about four ounces of blood being lost; when it was checked the wound was closed by means of pins, with points of interrupted suture intervening between them, and adhesive strips. The limb was placed upon a straight splint and bandaged, and cold water was kept applied over the whole arm by means of a saturated towel. In two hours after the commencement of the operation the patient was placed in bed, and was comfortable at seven o'clock in the evening, having been somewhat affected in the afternoon with sickness of the stomach from the effects of ether. The case is progressing favorably." In May, 1863, the patient was transferred to New York City, entering Ladies' Home Hospital, and was thence discharged the service and pensioned May 17, 1864. Surgeon A. B. Mott, U. S. V., certified to: "Ununited fracture of left humerus following exfoliation of bone from gunshot wound." Examiner G. S. Jones, of Boston, March 3, 1865, reported: "The wound was in the middle third of the left arm. In consequence of necrosis of the bone having taken place, the humerus is now ununited. Fistulous openings exist about the wounded parts, from which matter is discharging. The arm is now nearly powerless and useless." This man subsequently entered the Boston City Hospital. Dr. H. J. Bigelow reports the case in the *Boston Medical and Surgical Journal*, volume 76, page 332, as follows: "* * * In November, 1865, he entered the hospital. The left humerus had a false joint at its middle. There was necrosed bone at the bottom of a couple of sinuses in the lower fragment. An incision was made over the fracture, the periosteum reflected, and the ends of the bone sawed off. In March, 1866, there was no union. March 31st, Dr. Bigelow again operated. The periosteum was detached from both fragments for a sufficient distance; about one and a half inches was sawed off from the lower, and one inch from the end of the upper fragment. The ends were drilled, silver wire inserted, and the fragments placed in apposition. The periosteum was then replaced and its edges united by sutures. April 28th, the arm had stiffened at the point of fracture. June 10th, he fell upon the arm and broke it. July 15th, he was discharged with an ununited fracture, to return when the arm looks and feels better. January 12, 1867, operation by Dr. Bigelow. Patient was etherized. An incision three inches long was made over the outer aspect of the arm and carried carefully down to the point of fracture. The two ends were found to be much roughened. Great difficulty was experienced in everting the ends of the now short fragments and in detaching the periosteum. The bone was finally separated from the periosteum for a sufficient distance, and a piece one inch long sawed from the upper, and one three-quarters of an inch long from the lower fragment. The lower fragment was two inches in diameter; the upper one was of normal size, but with fatty degeneration of the marrow. A hole was drilled through the sides of both fragments, a silver wire was inserted, the ends were placed in apposition and the wire twisted. The periosteum was replaced and its edges united by sutures. The external wound was partly closed by sutures. A folded towel was placed in the axilla to lift out the short upper fragment, and the arm secured to the side, the forearm across the chest. 13th: There is almost complete paralysis of the extensors of the fingers of the left hand. No nervous trunk was known to have been divided in the operation, and the paralysis is perhaps due to a compression of the nerve in very forcibly everting the shortened fragments. 21st: The arm was placed in an apparatus, which consists of a firm cap about the shoulder, secured by a strap around the chest; this is made firm by two steel bridges to a splint that invests the forearm like a coat sleeve. 27th: The arm remains in excellent position. The power of extension is returning to the fingers. February 3d, the wound is contracting by healthy granulation. 6th: Slight stiffening at point of fracture. 16th: Phosphate of lime ordered, ten grains, three times a day. March 4th, allowed to walk about. April 16th, the humerus is quite firm at the point of fracture. He flexes the forearm and raises the humerus from the side freely. 22d: Discharged, probably well, although sufficient time has not elapsed to determine the fact. As will be readily inferred, this humerus was materially shortened by these consecutive

operations—two before entering the hospital, and three subsequently by Dr. Bigelow. In fact, by measurement, it was *seven inches* shorter than its fellow, yet the biceps and triceps were fulfilling their functions, and the patient was regaining excellent motion. There can be no comparison in the value of an arm of this sort, however short, and an ununited humerus. In the first operation, and during the existence of undefined necrosis, the bony tissue of the substance of the lower fragment was of a reddish hue, and of a dense, brittle, and amorphous texture, sometimes to be observed in the denuded walls of the cavities of sequestra when chiseled. At the end of about a year, at the next operation, when the probe no longer detected dead bone, the operator was agreeably surprized to find that this tissue had given place to a comparatively healthy one, with cancellated interior." The fragments of bone removed at the two first operations of Dr. Bigelow, with one of the wires, are shown as specimen No. 1008 of the Warren Anatomical Museum, Harvard University. (See *Desc. Cat.*, Boston, 1870, p. 166.) The pensioner was paid June 14, 1874.

The next case was also an example of resection for pseudarthrosis following shot injury:

CASE 1639.—Lieutenant T. Michener, Co. A, 1st New Jersey Cavalry, aged 27 years, was wounded at the Wilderness, May 5, 1864. He remained at a cavalry corps field hospital for several days, and was thence conveyed to Seminary Hospital, Georgetown, on May 11th. Surgeon H. W. Ducachet, U. S. V., reported: "Gunshot fracture of middle third of left humerus by a minié ball. Several days after admission the patient was furloughed. On July 2d, when returning to the hospital, the original wound had nearly healed, but the fracture was found ununited and the end of the bone rounded and covered with callus. Constitutional condition very good. On July 7th, chloroform was administered and one inch of the humerus excised. Favorable progress followed the operation. On September 25th, the patient again left the hospital on furlough." On October 22d, he was admitted to Division Hospital No. 1, Annapolis. Surgeon B. A. Vanderkeift, U. S. V., noted: "Resection of left humerus." Lieutenant Michener was discharged from service on December 2, 1864, and pensioned. Examiner W. Corson, of Norristown, Pennsylvania, April 12, 1865, certified: "The wound was received about the middle of the humerus, left arm; was resected about two months after injury, and is now reunited and firm, with shortening of not more than half to three-fourths of an inch." The Philadelphia Board, consisting of Drs. J. Collins, H. E. Goodman, and T. H. Sherwood, certify, on October 13, 1873: "Cicatrices adherent to bone and three inches long; arm weakened, curved, and muscles bulging." The disability was rated total. Pensioner has been paid to March 4, 1875.

Imperfect consolidation or non-union and pseudarthrosis, unusual after expectant treatment of shot fractures of the humerus, were not infrequent after excisions in the continuity.

The majority of the cases in this series, however, were of the nature of operations for necrosis, as in the following instance and in the abstract succeeding the tabular statement:

CASE 1640.—Sergeant J. W. Ross, Co. C, 93d New York, aged 25 years, was wounded at Petersburg, June 22, 1864. He was sent to Philadelphia, and entered Filbert Street Hospital. Assistant Surgeon S. J. Storrow, U. S. A., noted: "Gunshot fracture of the humerus, not involving the joint." The patient was transferred to McClellan Hospital April 28th, and subsequently entered Ira Harris Hospital, Albany. Assistant Surgeon J. H. Armsby, U. S. V., contributed the specimen (FIG. 511), with the following history: "Patient was wounded in the left arm, the ball injuring the humerus. Admitted July 20, 1865. The arm continued swollen and inflamed, and several fistulæ made their appearance. September 26, 1865: On exploring with the probe, they were found to lead to a large sequestrum, which was accordingly removed. A large incision was made, about five inches long, and the dead bone removed with the forceps. Ether was administered. Simple dressings applied." The specimen consists of four fragments of a sequestrum, four inches in length, from the left humerus, three months after gunshot fracture. About one-third of the circumference is involved (*Cat. Surg. Sect.*, 1866, p. 137). The patient was discharged November 30, 1865, and pensioned. Examiner E. W. Howard, October 3, 1866, certified: "Shot through the left arm near the shoulder, breaking the humerus, followed by extensive gangrene and sloughing of the muscles, leaving the entire arm utterly useless for any practical purpose, the remaining flesh having adhered firmly to the bone nearly the whole length of the arm." Examiner F. J. Bancroft, of Denver, Colorado, September 13, 1873, certified: "There is atrophy of the left arm, and it is entirely useless for manual labor." The disability was rated total. The pensioner was paid March 4, 1875.

FIG. 511.—Necrosed sequestra from a humerus fractured by shot. *Spec.* 4016. ½.

Of the thirty-six operations—thirty-one practised on Union and five on Confederate patients—fourteen were on the right and twenty on the left side, the point being unspecified in two cases. The middle third was chiefly implicated in fourteen, the upper in twelve, the lower in ten cases.[1] Twenty-five men were discharged, five paroled or exchanged, six returned to modified duty. Twenty-eight were placed on the pension list, two of whom have died. Troublesome gangrene appeared after three of the operations, and obstinate hæmorrhage in one.

[1] The extent of bone removed is specified, in 26 of the operations, as one inch in 4 cases, two inches in 9 cases, two and a half or three inches in 3 cases, three and a half inches in 3 cases, four inches in 6 cases, five inches in 1 case.

TABLE LXI.

Condensed Summary of Thirty-six Successful Secondary Excisions of the Shaft of the Humerus for Shot Injury.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Blough, P., Pt., G, 88th Indiana, age 28.	Feb. 23, Dec. 16, 1864.	Left; two inches lower third; by Surg. G. Grant, U. S. V. Disch'd March 20, 1865; pensioned; anchylosis.
2	Boswiere, P., Pt., D, 6th Wisconsin, age 21.	May 8, Dec. 6, 1864.	Right; four inches upper and middle thirds; by A. A. Surg. H. S. Streeter, U. S. A. Disch'd June 7, 1865; pensioned; bony union; anchylosis.
3	Broughton, J., Pt., G, 6th Infantry, age 31.	May 2, Dec. 20, 1863.	Right; necrosed bone, lower third; by Ass't Surg. H. E. Brown, U. S. A. Disch'd March 29, 1864; pensioned.
4	Claffey, H., Pt., C, 21st Massachusetts.	Mar. 14, April 15, 1862.	Left; three inches upper third; by Surg. W. H. Church, U. S. V. Duty July 10, 1862; pensioned; arm useful; atrophied.
5	Darby, J., Pt., G, 96th Illinois, age 22.	Sept. 20, Nov. 26, 1863.	Left; two inches middle third; by A. A. Surg. M. L. Herr, U. S. A. To V. R. C. Aug. 26, 1864; progressed finely; pensioned.
6	Dusty, F., Pt., I, 31st Maine, age 16.	May 10, June 13, 1864.	Left; three and a half inches; by A. A. Surg. F. G. H. Bradford, U. S. A. Disch'd Jan. 14, 1865; pensioned. Died April 10, 1866.
7	Ezekiel, I. D., Lieut., 10th West Virginia, age 22.	July 7, Aug. 22, 1864.	Right; four and a half ins. lower third; by Dr. W. H. Mussey. Disch'd Mar. 9, 1865; bony union; full use of arm; not a pensioner.
8	Fisk, C. A., Pt., K, 11th Massachusetts, age 21.	July 2, —, '63.	Left; four inches upper third; by Dr. Hodges. Disch'd Mar. 15, 1864; necrosis; pensioner.
9	*Floyed, E.*, Pt., I, 2d Georgia, age 30.	June 27, Dec. 17, 1862.	Dead bone to the extent of at least one-half the original; use of arm restored.
10	*Hill, M.*, Pt., B, 7th Louisiana.	Sept. 1, 1862, Aug. 20, 1863.	Left; diseased ends of bone in lower and middle thirds. Recovered.
11	Johnson, A., Pt., H, 7th New Jersey, age 21.	July 2, 1863, June 5, 1864.	Right; portion of humerus; by A. A. Surg. M. B. Richardson. Disch'd Oct. 7, 1864; pensioned; arm useless.
12	Kahlmeyer, W., Serg't, E, 8th N. York, age 40.	June 8, Aug. 19, 1862.	Right; nineteen fragments upper third; by A. A. Surg. S. D. Gross. Disch'd Jan. 28, 1863; pensioned.
13	Kanery, J., Pt., A, 9th Massachusetts, age 37.	July 1, 1862, Feb. —, 1863.	Left; two inches upper and middle thirds; by Dr. Hodges, Soldiers' Home, Boston. Disch'd Nov. 5, 1862; pensioned; no bony union.
14	Linn, C., Corp'l, H, 15th Ohio, age 31.	May 27, Sept. 4, 1864.	Right; one inch; by A. A. Surg. A. Buckingham. Disch'd March 17, 1865; pensioned; anchylosis.
15	*Marrh, J. H.*, Lieutenant, Scott's Battery.	Sept. 19, Oct. 21, 1863.	Left; about four inches lower third. Recovered.
16	Michener, T., Lieut., A, 1st New Jersey Cavalry, age 27.	May 5, July 7, 1864.	Left; one inch middle third; by Surg. H. W. Ducachet, U. S. V. Disch'd Nov. 2, 1864; pensioned.
17	Miller, R., Pt., M, 3d R. Island Art'y, age 35.	Aug. 30, 1863, Feb. 25, 1864.	Left; portion of shaft; by A. A. Surg. J. W. Cushing, U. S. A. Disch'd Aug. 5, 1864; pensioned.
18	Murray, P., Pt., H, 70th New York, age 22.	May 5, 1862, Feb. 21, 1863.	Left; necrosed portion of middle third. Disch'd May 17, 1864; pensioned.
19	*P*——, late Confederate soldier.	May 3, 1863, Jan. 9, 1864.	Five inches upper third; by Dr. Schmidt; no bony union.
20	Phillips, H. W., Pt., F, 1st Michigan Cavalry.	May 25, Dec. 6, 1862.	Right; fragments removed and ends of bone sawn off three and a half inches above external condyles, by Surg. W. M. Breed, U. S. V.; fracture united. Disch'd March 13, 1863; pensioned.
21	Pollock, G., Captain, E, 78th, Illinois, age 28.	Sept. 20, Oct. 22, 1863.	Right; about two inches of shaft; by Ass't Surg. W. W. Wythes, U. S. V. Duty April 19, 1864; resigned June 27, 1864; pensioned; arm useless.
22	Reeves, P. S., Serg't, G, 23d Kentucky, age 23.	May 27, July 5, 1864.	Right; two and a half inches of middle third; by Dr. A. McGraw. Duty Nov. 15, 1864; pensioned; complete bony union; arm of great service.
23	Riffle, J., Pt., F, 10th West Virginia, age 25.	Nov. 6, Dec. 26, 1863.	Left; three and three-quarter inches lower third; by Surg. C. E. Denig, 28th Ohio; arm amp. Feb. 8th; healed. Disch'd Oct. 24, 1864; pensioned.
24	Robbins, L. N., Pt., C, 9th New York Cavalry, age 27.	May 12, 1864, Jan. 27, 1865.	Left; two inches at middle third; by A. A. Surg. J. F. Thompson. Discharged May 31, 1865; pensioned.
25	Ross, J. W., Serg't, C, 93d New York, age 25.	June 22, 1864, Sept. 26, 1865.	Left; four inches of humerus; by Ass't Surg. J. H. Armsby. Discharged Nov. 30, 1865; pensioned. *Spec.* 4016.
26	Sarbach, D., Pt., A, 107th Ohio, age 37.	July 1, Oct. 11, 1863.	Left; one and a half inches of humerus; by A. A. Surg. E. A. Koerper. Disch'd April 18, 1865; pensioned.
27	Shultz, E., Pt., D, 102d New York, age 30.	Dec. 18, Mar. 25, 1865.	Right; nearly one-half inch removed from each end; by Ass't Surg. S. H. Orton. Disch'd July 14, 1865; pensioned.
28	Snider, D., Pt., E, 74th Illinois, age 19.	May 17, Mar. 19, 1865.	Left; two inches; by A. A. Surg. R. N. Isham. Disch'd June 12, 1865; pensioned.
29	Spinner, J., Corp'l, G, 28th Ohio, age 33.	Nov. 6, '63. Operat'n in 1864.	Left; excision of a large portion of middle third. Disch'd July 23, 1864; pensioned; can use hand well for light work.
30	St. Clair, L., Pt., M, 2d Ohio Heavy Artillery, age 22.	April 10, June 20, 1865.	Left; ends of bone at middle third; by A. A. Surg. T. W. Baugh. Disch'd Sept. 15, 1865; pensioned. Died Dec. 12, 1865.
31	*Taylor, C. A.*, Pt., I, 4th Georgia, age 22.	May 10, Aug. —, 1864.	Left; excision of portion of upper third. Transferred to Old Capitol Prison Nov. 1, 1864.
32	Tucker, W. A., Pt., E, 49th Ohio, age 22.	April 15, July 14, 1863.	Right; three and a half inches at upper third. Veteran Reserves; not a pensioner.
33	Ward, J. H., Pt., C, 36th Illinois, age 25.	Sept. 20, 1863, Jan. 22, 1864.	Right; by A. A. Surgeon J. H. Coover; subsequent removal of extremities of both fragments; no bony union. Mustered out Sept. 13, 1864; pensioned.
34	Wareham, H. H., Pt., A, 11th Penn'a Reserves, age 20.	June 30, Aug. 2, 1862.	Right; two inches middle shaft; by Surg. A. B. Hasson, U. S. A.; firm union. V. R. C. Aug. 30, 1863; not a pensioner. *Spec.* 434.
35	Wittgenfeld, R., Pt., B, 10th Ohio, age 21.	Oct. 8, Dec. 10, 1862.	Left; two inches just below head; by Ass't Surg. B. H. Cheney. Disch'd Jan. 24, 1863; pensioned.
36	Woodward, J. W., Lieut., I, 26th Penn., age 27.	May 3, 1863.	Right, at upper third; by Dr. Leavick. Transferred to V. R. C.; disch'd April 1, 1867; pensioned; anchylosis of shoulder joint and loss of power of whole limb.

CASE 1641.—Private H. H. Wareham, Co. A, 11th Pennsylvania Reserves, aged 20 years, was wounded in the right arm at White Oak Swamp, June 30, 1862. He was captured by the enemy and conveyed to Libby prison, at Richmond, at which place he remained until paroled and sent to Baltimore, where he entered Camden Street Hospital on July 25th. Surgeon A. B. Hasson, U. S. A., on August 2d, excised two inches of the middle third of the shaft of the humerus, and subsequently, on January 22, 1863, he removed eleven necrosed fragments, which he contributed to the Army Medical Museum (*Cat. Surg. Sect.*, 1866, p. 133, Spec. 434). On July 2d, the patient was transferred to Point Lookout Hospital, where Surgeon A. Heger, U. S. A., recorded: "Gunshot wound of right humerus." Subsequently the patient was transferred to Convalescent Camp at Alexandria, and on August 30, 1863, he was assigned to the Veteran Reserve Corps. He is not a pensioner. An account of this case was published by Acting Assistant Surgeon G. H. Dare, in the *American Medical Times*, Vol. VI, p. 208, 1863, as follows: "Private Wareham was wounded through the middle of the arm. He walked a mile to a field hospital, where his wound was bandaged.

On July 1st, he was captured by the Confederates and sent to Richmond, where he endured the usual hardships at the Libby prison until he was paroled and sent to Baltimore. He was admitted into the United States Army Hospital, Camden Street, Baltimore, July 25th. A musket ball had passed horizontally through the right arm from behind forward, fracturing the humerus in its middle third. Lateral splints were applied for the first time, and cold-water dressings. August 2d, union not having taken place, the fractured extremities were resected, about two inches of the bone being removed. The elbow was afterward well supported, but it was found impossible to keep the ends of the bone in immediate apposition—the finger for a long time could be passed between them. Notwithstanding this difficulty, within two months, union, at first of a cartilaginous or lymphatic nature, had taken place, and then osseous matter was gradually deposited. A fistulous orifice continued in front, and some dead bone being detected with the probe, the orifice was expanded January 22d, and several small sequestra, entirely detached, were removed. Osseous union was ascertained to be perfect. February 6th, there is still a trifling discharge from the anterior opening. The man can take off his cap without difficulty. Some stiffness of the muscles exists, which is rapidly passing away. There is every probability of his regaining almost perfect use of the limb."

There were in this series three instances of unsuccessful operations for pseudarthrosis, and one of consecutive amputation of the arm.

§ *Fatal Secondary Excisions.*—There were but five instances of fatal results after secondary excision of the shaft; one of them is detailed:

CASE 1642.—Corporal W. A. Armstrong, Co. B, 31st Maine, aged 23 years, was wounded at Petersburg, July 30, 1864, and was admitted into 2d division hospital, Ninth Army Corps. Surgeon J. Harris, 7th Rhode Island, noted: "Gunshot fracture of left arm; excision of humerus." On the second day after the reception of the injury the patient was transferred to City Point, and thence to Lovell Hospital, Portsmouth Grove. August 7th, Surgeon C. O'Leary, U. S. V., reported: "Gunshot fracture of left humerus, upper third. Patient furloughed November 30th, and readmitted on January 24th. At this time there was thorough cicatrization of the external wound; formation of false joint by re-absorption of callus; ligamentous union. On January 31st, resection of two inches of the upper third of the bone was performed, by Acting Assistant Surgeon E. Seyffarth, through a longitudinal incision four inches long. Anæsthetic: Chloroform and ether. Reaction prompt; considerable loss of venous blood attended the operation, but no arterial hæmorrhage. The arm was lightly bandaged, and the bones were brought in contact and secured by an elbow splint. Sutures were entirely dispensed with, as the edges of the wound were easily held in contact by the bandage and adhesive strips, the muscles having been somewhat relieved by a cross cut, about half an inch deep, in order to do away with the 'pockets' formed after pushing both ends of the bone together. During the first six days progress seemed favorable; but on the eighth day there was a severe chill, which was repeated every day or every other day; appetite failed; diarrhœa set in, and patient rapidly sank. On the ninth day several abscesses appeared on the inner surface of the arm. These, together with the wound, which had become partially reopened by the extreme tension caused by the swelling of the whole arm, were discharging an ichorous serum mixed with pus, and extremely offensive. The treatment consisted of cold-water applications in the beginning, and afterward of free use of solution of permanganate of potassa, stimulants as freely as could be borne, generous diet, muriated tincture of iron, &c. Death occurred on February 19, 1865. At the *post-mortem* examination of the shoulder and elbow joints, a small quantity of pus was found in the former, but no metastatic abscesses were discovered."

TABLE LXII.

Condensed Summary of Five Fatal Secondary Excisions of the Shaft of the Humerus for Shot Injury.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Armstrong, W. A., Corporal, B, 31st Maine, age 23.	July 30, 1864. Jan. 31, 1865.	Left; two inches upper third; by A. A. Surg. E. Seyffarth. Died Feb. 19, 1865, of pyæmia. It is stated that excision had been performed on the field.	4	Todd, W. H., Pt., F, 111th Illinois, age 22.	May 14, July 1, 1864.	Left; three inches middle third; by Ass't Surg. S. C. Ayres, U. S. V. Died Feb. 27, 1865, of pleuro-pneumonia.
2	*Dunn, D.*, Pt., H, 37th North Carolina, age 29.	.....	One in. from each end of bone. Died July 28, '63, of pleuro-pneumonia.	5	Truitt, G. P., Pt., C, 110th Ohio, age 23.	June 9, July 21, 1864.	Left; portion of upper third; by Surg. G. S. Palmer, U. S. V. Died July 29, 1864.
3	Markel, J. D., Serg't, F, 50th Ohio.	May 16, June 24, 1863.	Left; upper third; by Ass't Surg. E. C. Strode, U. S. A. Died July 9, 1863, of pleuro-pneumonia.				

Excisions in the Shaft of the Humerus at an Unknown Period after Shot Injury.—In seventy-five instances, the interval between the dates of injury and operation could not be ascertained.

§ *Cases of Recovery.*—Fifty-one operations were successful so far as the preservation of life was concerned, as indicated in the following table. The operations were practised on twenty-nine Confederate and twenty-two Union soldiers. Three of the latter resumed active duty, and nineteen were pensioned. In one case, consecutive exarticulation at the

shoulder was successfully practised. The operations were on the right arm in fourteen and on the left in twenty-nine, this point being left in doubt in eight cases. The excisions were made in the upper third in fifteen, the middle third in twelve, the lower in ten cases. In fourteen cases the seat of operation was not precisely specified:

TABLE LXIII.

Condensed Summary of Fifty-one Successful Cases of Excision of the Shaft of the Humerus for Shot Injury, the Time between the Injury and Operation being unknown.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	*Avery, S. H.*, Pt., C, 3d S. C. Battery, age 21.	Sept. 20, 1863.	Left; four inches; permanently disabled. Retired Jan. 31, 1865.
2	*B*——, Confed. soldier..	Sept. 19, 1863.	Resection of two inches, one and a half inches above elbow joint, by Surgeon Crawford, C. S. A.; functions but little impaired.
3	Babcock, E., Pt., B, 26th New York.	Dec. 13, 1862.	Left; excision at the upper third. Disch'd Jan. 5, 1863; disability total; not a pensioner.
4	*Boone, N. T.*, Pt., G, 57th Virginia, age 20.	July 3, 1863.	Left; five inches of middle third; recovered.
5	*Burnett, J. T.*, Lieut., K, 23th Mississippi.	Aug. 18, 1864.	Right; resection of three inches. Furloughed October 3, 1864.
6	Butler, J., Pt., C, 2d Infantry.	July 21, 1861.	Left; excision of humerus; false joint formed. Disch'd April 24, 1862; pensioned.
7	*Carruth, A. D.*, Pt., E, 15th Mississippi, age 18.	May 12, 1864.	Right; three inches excised; no bony union; arm useless. Retired March 23, 1865.
8	*Clements, T. M.*, Serg't, A, 12th Georgia Battery, age 34.	June 2, 1864.	Left; excision of portion of shaft at upper third; false joint. Retired Jan. 30, 1865; arm almost useless.
9	*Corsley, J. A.*, Pt., I, 6th Virginia, age 28.	June 28, 1864.	Left; excision three and a half inches. Retired Feb. 10, 1865; disability.
10	Cunningham, T., Pt., H, 11th Penn., age 21.	May 10, 1864.	Left; two inches of lower third. Disch'd July 31, 1865; necrosis of elbow joint; pensioned.
11	Curtin, T., Serg't, I, 48th Massachusetts.	May 27, 1863.	Right; excision of two inches. Disch'd Sept. 2, 1863; pensioned; bone ununited; arm useless.
12	Doner, A. R., Pt., C, 77th Pennsylvania, age 21.	June 25, 1863.	Left; lower third. Disch'd Oct. 6, 1864; pensioned; partial anchylosis of elbow joint.
13	Englis, J. T., Pt., G, 134th Pennsylvania, age 30.	Dec. 13, 1862.	Right; resection at middle third. Disch'd Mar. 24, 1863; pensioned.
14	F——, O. W., 77th New York.	.....	Excision of three inches; false joint substituted; uses arm with great freedom.
15	Faulkner, D., Corp'l, B, 136th New York, age 24.	July 3, 1863.	Left; three inches of middle third. Disch'd Dec. 2, 1863; healed; pensioned; little or no use of arm; compelled to carry it in a sling.
16	Fenstermacher, F., Pt., C, 50th Pennsylvania.	Sept. 17, 17, '62.	Left; three inches of upper third. Disch'd Sept. 26, 1863; pensioned.
17	Fisher, C. Y., Capt., A, 138th Penn., age 32.	Nov. 27, 1863.	Right; two inches at lower third. Disch'd Sept. 17, 1864; pensioned.
18	*Gill, J. J. L.*, Lieut., F, 5th South Carolina.	May 7, 1864.	Resection of three inches. Furloughed July 14, 1864.
19	*Hardy, T. S.*, Pt., D, 14th Alabama, age 24.	Operat'n Aug. 26, 1864.	Left; three and a half inches. Furloughed October 15, 1864.
20	Harter, T. J., Pt., A, 41st Illinois, age 19.	April 6, 1862.	Right; middle of fractured portion united by shortening one and a half inches; cannot extend arm. Disch'd Dec. 5, 1862; pensioned.
21	*Haynie, J. B.*, Pt., A, 2d Georgia S. S., age 17.	Sept. 20, 1863.	Resection near elbow. Recovered, with false joint.
22	*Hood, J. M.*, Lieut., B, 1st Engineers, C. S. A.	May 1, 1864.	Resection of portion of left humerus. Furloughed Aug. 15, 1864.
23	*Horner, C.*, Pt., H, 48th North Carolina, age 43.	Oct. 7, 1864.	Left; excision in middle third. Retired Feb. 10, 1865; permanent disability.
24	*Hunter, B. C.*, Pt., G, 2d Arkansas, age 21.	Nov. 30, 1864.	Left; about two inches of middle third. Sent to Provost Marshal March 7, 1865.
25	*Hunter W.*, Serg't, H, 13th Georgia, age 32.	May 12, 1864.	Right; one and a half inches. Retired February 9, 1865; partial paralysis; limb useless.
26	Knight, D., Pt., D, 8th N. Y. Cav., age 26.	Nov. 2, 1862.	Right; resection. Disch'd July 14, 1863; pensioned.
27	Koons, W., Pt., G, 132d Pennsylvania.	Sept. 17, 1862.	Left; excision of a portion. Discharged Dec. 6, 1862; pensioned.
28	*Logan, L. C.*, Corp'l, H, 21st N. C., age 22.	July 2, 1863.	Resection in the upper third. Recovered.
29	*Martin, J. R.*, Pt., E, 3d South Carolina.	Sept. 17, 1862.	Left; excision; amputation at the shoulder joint. Dec. 1st, promised a speedy recovery.
30	Martin, J. S., Serg't, K, 93d Illinois, age 33.	May 14, 1863.	Left; two and a half inches middle third; Veteran Reserves Mar. 2, 1864. Disch'd Mar. 30, 1865; pensioned.
31	McKeever, M., Pt., B, 23d Kentucky, age 35.	May 27, 1864.	Right; two inches at lower third and removal of fragments of bone from fractured scapula; V. R. C. March 10, 1865; shoulder very weak; arm shorter. Mustered out August 29, 1866; pensioned.
32	*Mickey, T. E.*, Pt., I, 33d N. C., age 24.	May 3, 1863.	Left; four inches lower third. Retired January 28, 1864.
33	*Miller, K. P.*, Pt., G, 7th N. C. Art'y, age 19.	Sept. 19, 1864.	Right; three inches at upper third. Transferred to Provost Marshal February 11, 1865.
34	Nusser, H., Pt., A, 49th Ohio, age 20.	Sept. 19, 1863.	Left; middle third. Discharged May 14, 1864; pensioned.
35	*Ogletree, W. D.*, Pt., K, 14th Alabama, age 19.	June 23, 1864.	Left; three inches at middle third; wound healing firmly, by granulation, July 31st. Furloughed August 31, 1864.
36	*Padgel, J. W.*, Pt., F, 13th Alabama, age 22.	May 6, 1864.	Left; one and a half inches; ligamentous union; wound did not heal. Retired Feb. 16, 1865; disability.
37	Patton, J., Corp'l, E, 2d Pennsylvania Reserves.	Sept. 17, 1862.	Left; upper third. Disch'd Dec. 20, 1862, and pensioned.
38	*Poff, W. J.*, Pt., H, 19th Mississippi, age 18.	.....	Left; two and a half inches lower third; also right elbow joint fractured. Retired Jan. 27, 1865; partial anchylosis of elbow joint.
39	*Powell, A. S.*, Pt., D, 6th N. C., age 30.	April 18, 1864.	Left; excision of portion of humerus. Retired December 30, 1864; disability.
40	*Powell, J. T.*, Pt., B, 5th N. C., age 22.	July 3, 1863.	Right; three inches at upper third. Exchanged March 17, 1864.
41	Powers, R., Corp'l, B, 45th Illinois, age 20.	April 6, 1862.	Left; resection at upper third; arm not much disabled; one and a half inches shortening. Veteran Reserves Nov. 25, 1863; not a pensioner.
42	Quinn, J., Pt., C, 83d Ohio, age 26.	Jan. 11, 1863.	Left; lower third. V. R. C. Nov. 11, 1863. Disch'd May 11, 1865; pensioned.
43	Reed, A., Pt., B, 11th Missouri, age 19.	May 27, 1863.	Left; excision of upper third; not united; arm shortened about three inches; shoulder joint anchylosed. Discharged August 5, 1863; pensioned.
44	*S*——, Capt., K, 31st Tennessee, C. S. A.	July 22, 1864.	Three inches of bone removed for fracture of the upper and middle thirds; cannot extend limb but can flex; arm healthy.
45	*Shilling, J. J.*, Pt., B, 42d Virginia, age 25.	Sept. 19, 1864.	Excision of six inches three inches below shoulder joint. Retired Jan. 20, 1865; disability; arm useless.
46	Smith, J. N., Pt., G, 89th Illinois.	Sept. 19, 1863.	Right; three inches of upper third. Discharged June 6, 1864; pensioned; arm useless.
47	*Stafford, J. S.*, Lieut., H, 7th North Carolina.	May 12, 1864.	Resection of two and a half inches. Furloughed May 30, 1864.
48	*Tolson, A.*, Pt., 1st Maryland Artillery.	May 3, 1863.	Right; excision of two inches of shaft. Duty October 30, 1863.
49	*Tucker, W. F.*, General..	May 14, 1864.	Left; three inches, to within three-fourths of an inch of anatomical neck; by Dr. J. S. Cain; healed promptly; no bony union; limb shortened three inches; can use forearm and hand when rested on a table or supported; is far preferable to no arm.
50	*Usry, R. C.*, Pt., D, 10th Alabama, age 30.	June 6, 1864.	Left; four inches of middle third. Furloughed August 20, 1864.
51	Yoast, J. S., Pt., F, 6th Ohio, age 19.	Sept. 19, 1863.	Right; two inches of upper third; strong callus united the bone; arm shortened one inch. Disch'd June 21, 1864; pensioned.

To complete the series of six hundred and ninety-six excisions in the continuity of the humerus after shot injury, there remain twenty-four cases, of which the histories are very imperfect. What has been ascertained is recapitulated in the two succeeding tables:

TABLE LXIV.

Condensed Summary of Twelve Fatal Cases of Excision of the Shaft of the Humerus, in which the Time of Operation was not ascertained.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	*Bowles*, W., Pt., G, 57th Virginia.	.....	Left; excision of middle third. Died Sept. 30, 1863.	8	Sherwood, O., Pt., K, 132d Pennsylvania.	Sept. 17, 1862.	Excision of portion of humerus. Died Oct. 13, 1862.
2	Bunnell, D., Pt., H, 93d Illinois.	.....	Left; excision. Died September 13, 1863.	9	Squiers, H., Pt., F, 5th Ohio.	Sept. 17, 1862.	Right; excision of a portion of humerus. Died Nov. 5, 1862.
3	Garland, B. F., Pt., D, 11th Infantry.	May –, 1864.	Right; excision. Died June 3, '64.	10	Ward, H. B., Pt., A, 103d Ohio, age 19.	Oct. 15, 1863.	Left; about seven inches from surgical neck downward. Died Feb. 17, 1864, of small-pox.
4	Grissins, C., Pt., B, 11th Pennsylvania.	Mar. 31, 1865.	Right; excision of two inches at lower third. Died May 21, 1865, of erysipelas.	11	Wagner, C., Pt., F, 68th New York.	.....	Right; exsection. Died October 15, 1862.
5	*Joice, J. A.*, Pt., H, 42d Virginia.	.....	Excision of a portion of humerus. Died June 8, 1864, of pyæmia.	12	Westerman, G., Pt., F, 5th Ohio.	Sept. 17, 1862.	Left; excision of a portion. Died Oct. 27, 1862.
6	Moyer, M., Pt., G, 28th Pennsylvania.	Sept. 17, 1862.	Excision of a portion of humerus. Died Oct. 15, 1862.				
7	Seiler, W., Corp'l, A, 104th Ohio, age 19.	June 14, 1864.	Left; one and a half inches excised from middle third. Died Aug. 29, 1864.				

TABLE LXV.

Condensed Summary of Twelve Cases of Excisions of the Humerus for Shot Injury, the Result and the Time between Injury and Operation being unknown.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	*Beison, J. J.*, Corp'l, G, 27th Virginia, age 24.	May 3, 1863.	Three inches of shaft resected.	7	*Hunt, B.*, Pt., K, 57th Virginia.	July 3, 1863.	Left; excision middle third.
2	*Chasteen, A. C.*, Pt., D, 2d South Carolina.	Sept. 30, 1864.	Left; excision.	8	*King, T.*, Pt., B, 38th Georgia.	.....	Left; excision.
3	*Craig, J.*, Pt., A, Orr's Rifles.	July 28, 1864.	Right; excision.	9	*Land, S. L.*, Pt., C, 13th South Carolina.	Aug. 16, 1864.	Left; excision.
4	*Gamble, J. A.*, Pt., F, 59th Georgia.	Nov 18, 1863.	Right; excision.	10	*Murphy, L.*, Pt., F, 5th South Carolina.	Aug. 16, 1864.	Right; excision.
5	*Harris, J.*, Pt., E, 21st Georgia.	July –, 1863.	Right; excision.	11	*Smoke, J. W.*, Pt., B, 30th Virginia, age 33.	Oct. 13, 1864.	Right; resection of upper third. January 1, 1865, not doing well.
6	*Hennington, L.*, Corp'l, G, 46th Virginia, age 46.	June 2, 1864.	Left; two or three inches at lower part of upper third; progress favorable.	12	*Welch, R. L.*, Corp'l, E, Palmetto Sharpshooters.	Oct. 7, 1864.	Right; excision.

Concluding Observations on Excisions in the Continuity of the Humerus after Shot Injury.—Excluding operations for necrosis, and, possibly, resections for pseudarthrosis, formal excisions in the continuity of the long bones, and especially in the humerus, were generally regarded prior to the war with disfavor by American surgeons.[1] They seem now to be less emphatically condemned. But I cannot discern that the experience of the war lends any support to the doctrine of the justifiability of operations of this nature, except in

[1] The opinions of American surgeons who have treated, since the war, of the merits of this operation, may be summarized as follows: Dr. J. ASHHURST, jr. (*The Principles and Practice of Surgery*, 1871, p. 167) declares: "Excision in the continuity of the humerus * * is more fatal than amputation of the corresponding parts; still the difference is not so great but that the operation may be regarded as justifiable in favorable cases." See also this author's remarks on *Surgical Cases*, in the *Am. Jour. Med. Sci.*, 1863, Vol. XLV, p. 342. Professor F. H. HAMILTON (*The Principles and Practice of Surgery*, 1872, p 391) observes: "A few fortunate examples in which excisions of considerable portions of the shaft of the humerus have resulted in bony union do not authorize a well-grounded hope that it will generally occur, or a repetition of the practice, except as a last alternative." Dr. S. W. GROSS (*Military Surgery*, in *Am. Jour. Med. Sci.*, 1867, Vol. LIV, p. 475) regards formal resections of portions of the shafts of long bones "not only as unnecessary and dangerous, but also as prejudicial, from the fact of the union of the divided extremities being uncertain and imperfect." Professor S. D. GROSS (*A System of Surgery*, 5th ed., 1872, Vol. II, p. 1087) thinks "excision of the shaft of the humerus is sometimes required on account of gunshot injuries," and that the tabular statement prepared by his son, Dr. S. W. GROSS, "shows much more favorable results" than appeared from the Schleswig-Holstein and Crimean experience. Dr. G. H. STEVENS (*On Excisions in Cases of Gunshot Wounds*, in *Trans. of Med. Soc. of State of New York*, 1866, p. 138) gives a favorable case, and the opinion that "Excisions of the humeral shaft, although not often required, yet in some instances are advisable, and the cases were quite as promising as other resections." Dr. W. GILFILLAN (*Ibid.* p. 132. *Excision of the Shaft of the Humerus*) cites a partially successful case and advocates the operation as a secondary procedure. Surgeon D. G. BRINTON U. S. V. (*Appendix to Part I of Med. and Surg. Hist. of the War of*

very exceptional cases. The numerical return, and the necessarily abbreviated summaries, may appear, at first glance, to represent the results in a favorable light; but a more precise analysis reveals most lamentable conclusions. The naked figures are as follows:

TABLE LXVI.

Numerical Statement of Six Hundred and Ninety-six Cases of Excisions in the Shaft of the Humerus for Shot Injury.

OPERATIONS.	Cases.	Recovery.	Fatal.	Result Unknown.	Mortality Rate of Determined Cases.
Primary	487	326	145	16	30.7
Intermediary	93	64	29	.....	31.1
Secondary	41	36	5	.....	12.1
Time of operation unknown	75	51	12	12	19.0
Aggregate of Excisions in Continuity	696	477	191	28	28.5

The mortality rate is nearly double that observed in the cases treated by expectant measures, and more than 12 per cent. higher than the fatality in a larger series of primary amputations in the upper third of the arm. Moreover, in the four hundred and seventy-seven cases of recovery, there were no less than ninety-nine instances in which "no bony union" was reported, and sixty-five others recorded as examples of "false-joint." There were also among the cases reported as "successful" thirty-seven instances of consecutive amputations of the arm. Recourse was had to ulterior exarticulation or amputation in sixty-four patients, of whom twenty-seven perished.

Such evidence warrants the assertion that early excisions in the continuity of the humerus after injury can seldom be justifiable, a conclusion at which European surgeons had already arrived from the experience of the Schleswig-Holstein and Danish wars,[1] and which has been confirmed by more recent observations.[2] The coaptation of the resected ends of the bone by silver wires was sometimes practised, with few illustrations of favorable

the Rebellion, p. 293) states that: "The astonishing success that attended resections of the humerus in its continuity, both here [Chattanooga] and after the battle of Gettysburg, convinces me that the objections urged against this operation are entirely unfounded." His argument in full may be found at the page indicated. AMERMAN (G. K.) (*Chicago Med. Jour.*, 1866, Vol. XXIII, p. 358) reports a primary excision of four inches of the middle of the shaft of the left humerus. The patient recovered in three months; but the arm refractured, and the author concludes that "the operation of excision in the continuity of the long bones is still of doubtful expediency." BILLINGS (J. S.) (*Appendix to Part I, Med. and Surg. Hist. of the Rebellion*, p. 146) remarks, after Gettysburg: "In no case of fracture of the long bones did I attempt any formal resection. * * From my experience in Cliffbourne Hospital, I am convinced that regular resections in such cases are worse than doing nothing at all."

[1] SCHWARTZ (H.) (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, S. 212) declared: "Resection in the continuity of the humerus is to be rejected." STROMEYER (L.) (*Maximen der Kriegschirurgie*, Hannover, 1855, S. 677) states: "Already, in the year 1849, extensive resections in the diaphyses were discountenanced; and, in the campaign of 1850, even limited resections of the diaphyses were not undertaken, and the extraction of splinters was confined to the removal of such as were readily accessible and entirely loose. * * Far be it from me to contend," he adds, "that free incision in cases of shot fracture, and careful removal of all splinters and beveling of fragments, have no rational foundation, and may not lead to favorable results." DEMME (H.) (*Militär-chirurgische Studien*, 1861, S. 230) tabulates, from Italian hospitals, 7 cases of excisions in the shaft of the humerus, of which 4, or 57.1 per cent, were fatal, and concludes: "We must reject excision of the shaft of the humerus. The unfavorable result of the operation, as compared with resection of the shoulder joint, may be due partly to the greater extent of the operative interference, but especially to the opening of the medullary cavity." FISCHER (H.) (*Kriegschir. Erf.*, Erlangen, 1872, S. 145) says: "Even in case of necrosis of the fractured ends, we hesitated to institute operative interference, as in preceding wars our experience in regard to resection of the shaft of the humerus in the continuity had been exceedingly lamentable."

[2] KLEBS (E.) (*Beiträge zur Pathologischen Anatomie der Schusswunden*, Leipzig, 1872, S. 15) gives an autopsy in the case of Nötzel, wounded, near Strassbourg, September 4, 1870: "Shot fracture of the shaft of the humerus; resection of the ends of the bone; death October 14, 1870, * * * large pus cavity, into which protrude the sawn ends of the shaft, denuded of periosteum and necrosed; the medullary cavity filled with exuberant granulations." Dr. KLEBS remarks: "It is true that it cannot be ascertained how far the loss of periosteum of the resected ends is due to the effect of ichorous pus, but, in view of the slight disposition toward callus-formation, the removal of larger but yet adherent bone-splinters must necessarily diminish the chances of a definite consolidation, and any aid toward the separation of the necrosed portions can hardly be expected; on the contrary, any interference before the consolidation might readily lead to fresh necrosis of the sawn ends." CHENU (J. C.) (*Aperçu hist., etc., pendant la Guerre de* 1870–71) tabulates 98 cases of excisions in the shaft of the humerus, of which 84, or 85.7 per cent., were fatal.

results. Examination of the details of many of the formal primary excisions in the shaft strengthens the impression that they were for the most part unnecessary and injurious.

AMPUTATIONS OF THE ARM FOR SHOT INJURY.—The records present fifty-four hundred and fifty-six cases of this nature. Fifty-four have already been particularized on page 469, as practised on account of flesh wounds or their complications. Three thousand six hundred and eighty-five were performed on account of shot fractures of the shaft of the humerus or their consequences, and seventeen hundred and seventeen amputations were done for the immediate or remote results of shot injuries of the elbow joint or of the forearm. The results as to fatality, the period at which the operations were done, and the point at which amputations[1] were practised are indicated, as far as known, in the following table:

TABLE LXVII.

Summary of Five Thousand Four Hundred and Fifty-six Amputations of the Arm for Shot Injury.

OPERATIONS.	CASES.				UPPER THIRD.			MIDDLE THIRD.			LOWER THIRD.			SEAT NOT RECORDED.		
	Recovery.	Death.	Result Undetermined.	Total.	Recovery.	Death.	Result Undetermined.	Recovery.	Death.	Result Undetermined.	Recovery.	Death.	Result Undetermined.	Recovery.	Death.	Result Undetermined.
Primary	2,657	602	.....	3,259	1,155	183	.....	1,019	143	.....	406	106	.....	77	170	.....

Secondary	297	114	.....	411	127	46	.....	127	35	.....	37	24	.....	6	9	.....
Time between injury and operation not stated.	473	228	183	884	61	21	12	45	13	9	22	.....	2	345	194	160
Aggregates	4,027	1,246	183	5,456	1,582	358	12	1,446	284	9	559	197	2	440	407	160

It will be observed that the results as to fatality were ascertained in fifty-two hundred and seventy-three cases, twelve hundred and forty-six, or 23.6 per cent., terminating fatally. It has been seen (p. 655) that the fatality of the series of eight hundred and forty-one determined cases of amputation at the shoulder joint was in the proportion of 29.1 per cent. The results, therefore, conform to the general rule formulated by M. Legouest, that amputations in the continuity below a joint have less gravity than amputations through that joint,[2] and vindicate the precept of amputating always as far as possible from the trunk.

PRIMARY AMPUTATIONS IN THE CONTINUITY.—In three thousand two hundred and fifty-nine cases, or nearly three-fourths of those in which the precise period of operation was ascertained, the amputations were practised within the forty-eight hours succeeding the injury. Undoubtedly there are cases in which the invasion of inflammatory phenomena takes place earlier or is deferred much later than this period; but, in dealing with statistics of such magnitude, it is necessary to adopt some arbitrary limit, and in this work, in deal-

[1] The predominance of amputations for shot injury of the upper portion of the arm corresponds with what has been observed in other wars. Thus, M. CHENU (*Aperçu hist. stat. et clin. sur le service des ambulances et des hôpitaux*, 1874, p. 492) tabulating 2026 cases of amputations of the arm with 606 recoveries and 1420 deaths (a mortality rate of 70.09), is able to determine the locality of the operation in 327 of the 606 successful cases; namely: upper third, 170—middle third, 106—and lower third, 51.

[2] LEGOUEST (L.) (*Traité de Chirurgie d'Armée*, 2ème éd., 1872, p. 552) says: "On doit maintenir le précepte d'amputer le plus loin possible du tronc, et l'on peut dire d'une manière générale que l'amputation faite au-dessous d'une articulation est moins grave que l'amputation pratiquée dans cette articulation même, et que la désarticulation est moins grave que l'amputation dans la continuité pratiquée au-dessus d'elle."

ing with amputations of the extremities, those have been classified as primary that were practised in the interval of forty-eight hours subsequent to the reception of the injury. The results as to fatality are ascertained in all instances.

1. Primary Amputations in the Upper Third of the Arm.—Thirteen hundred and thirty-eight cases, including eleven hundred and fifty-five instances of recovery and one hundred and eighty-three fatal examples, are comprised in this subdivision, a percentage of mortality of 13.6.

§ *Successful Cases.*—A few illustrations of the nature and extent of the injuries for which amputations high in the arm were practised, may precede the tabular statement of the cases of recovery:

FIG. 512.—Shot fracture of shaft of right humerus. *Spec.* 1147.

CASE 1643.—Sergeant G. H. Johnson, Co. B, 56th Pennsylvania, aged 27 years, received a gunshot fracture of the right arm, at Fredericksburg, April 30, 1863. Having been admitted to the field hospital, 1st division, First Corps, the injured limb was amputated by Surgeon G. W. New, 7th Indiana, who contributed the specimen (FIG. 512), which consists of the right humerus, amputated in the upper third for complete comminution in the middle third by a conoidal ball. On May 26th, the patient was transferred to St. Aloysius Hospital, at Washington, and subsequently he entered the Mower Hospital, Philadelphia, whence he was discharged on July 20, 1863, by reason of "loss of right arm near shoulder," on certificate of disability by Surgeon J. Hopkinson, U. S. V. In a statement of artificial limbs, furnished by Mr. Lincoln, of Boston, the amputation is reported as having been performed by the "flap method;" and in his application for commutation, in 1870, the pensioner describes the stump as being two inches long from the shoulder, and as being "very well but tender." He was last paid on March 4, 1875.

CASE 1644.—Private J. P. Wenner, Co. B, 3d Pennsylvania Cavalry, aged 19 years, was wounded in the right arm, near Ellis's Ford, December 3, 1863. He was admitted to a Cavalry Corps Hospital, where amputation was performed but not recorded. He remained at the field hospital until February 1st, when he was transferred to Douglas Hospital at Washington. Assistant Surgeon W. Thomson, U. S. A., reported: "Primary amputation of right arm below the anatomical neck, performed on the field for gunshot fracture of the humerus. On February 9th, the wound was entirely healed by first intention. February 26th, after a severe chill, the posterior angle of the wound again opened spontaneously and showed symptoms of local inflammation, which had recently subsided. The patient was enjoying good health with the exception of a nervousness produced by local irritation, induced by the presence of a foreign body in the soft parts. March 19th, an extraction was made of a flattened bullet from its lodgement in the inferior flap, by an incision one inch in length internally of the cicatrice, by Acting Assistant Surgeon Carlos Carvallo. Poultices were applied, and the stump was incised March 26th, on account of erysipelatous redness, on which a spontaneous opening appeared at the internal angle of the wound." The patient was discharged on account of the expiration of his term of service, July 25, 1864, and pensioned. In his application for commutation for an artificial limb, in 1870, he described the stump as being "very sore," and stated that Surgeon W. B. Hezless, 3d Pennsylvania Cavalry, performed the amputation. This pensioner was last paid on March 4, 1875.

CASE 1645.—Private T. Carroll, Co. C, 58th Massachusetts, aged 25 years, was wounded at Spottsylvania, May 12, 1864. He was conveyed to the field hospital of the 2d division of the Ninth Corps. Surgeon James Harris, 7th Rhode Island, reported a "shot wound near left shoulder; amputation a few hours after the injury, under chloroform, by Surgeon J. S. Ross, 11th New Hampshire, by the circular method, at the upper third. The humerus was found to be very much comminuted. The wound was brought together vertically by sutures." The case progressed favorably until May 26th, when the patient was transferred to Alexandria. Acting Assistant Surgeon A. McWilliams reported the admission of the patient at the general hospital at Alexandria, his progress without complications, and his transfer to Portsmouth Grove, Rhode Island. Here Surgeon L. A. Edwards, U. S. A., recorded his admission June 5, 1864, with "a large and unhealthy wound from a flap amputation at the upper third of the left arm, performed on the field on the day of injury. Stimulating applications, including bromine, were applied to the stump, and the patient slowly progressed toward recovery, and was sent to Central Park Hospital, New York, September 23, 1864, where he was supplied with an artificial limb, and discharged and pensioned January 1, 1875. While at Central Park, a plaster cast of the shoulder and stump was made, and a copy, from which the annexed wood-cut (FIG. 513) was prepared, was contributed to the Army Medical Museum by Acting Assistant Surgeon G. F. Shrady. (See *Cat. Surg. Sect.*, 1866, p. 546.) This pensioner was paid March 4, 1875.

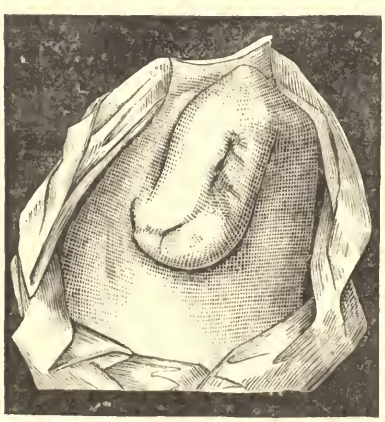

FIG. 513.—Cast of a stump seven months after a primary amputation at upper third of left arm. *Spec.* 1541.

Some of the primary amputations high up in the arm, in cases attended by comparatively little osseous splintering, were probably practised on account of real or apprehended lesions of the nerves, vessels, or other important soft parts:

FIG. 514.—Part of right humerus amputated for shot fracture. *Spec.* 2518.

CASE 1646.—Captain M. Runkle, Co. F, 56th Pennsylvania, age 36 years, was wounded in the right arm, at the Wilderness, May 6, 1864, and was operated upon at the field hospital, 4th division, Fifth Corps. Surgeon C. N. Chamberlain, U. S. V., noted: "Gunshot fracture of arm; amputation." Surgeon A. S. Coe, 147th New York, contributed the pathological specimen (FIG. 514), which consists of "a portion of the shaft of the humerus, nearly transversely fractured near the lowest third. From the posterior and inferior surface an irregular fragment, one by two inches, with the base at the line of fracture, has broken, but remains in position. Primary amputation has been performed at the junction of the upper thirds, three inches above the line of fracture, from which it appears the laceration of the soft parts must have been excessive." (*Cat. Surg. Sect.*, 1866, p. 123.) On May 19th, the patient reached Washington, where he obtained from Surgeon T. Antisell, U. S. V., a leave of absence for thirty days. On August 6th, he entered the Officers' Hospital, at Annapolis. Surgeon B. A. Vanderkieft, U. S. V., reported: "Gunshot wound of right arm. Flap amputation at junction of upper and middle third performed on day after injury." Captain Runkle was discharged from service on August 12, 1864, and pensioned. He was paid on December 4, 1874. In his application for commutation for artificial limb, dated 1870, he stated the stump as being in a healthy condition; also that Surgeon G. W. Metcalf, 76th New York, performed the amputation.

A number of examples of painful stumps, from bulbous enlargement of the extremities of the divided nerves, are observed in this series:

CASE 1647.—Private J. Brien, Co. G, 97th New York, aged 36 years, was wounded in the right arm by grapeshot, at Antietam, September 17, 1862. On October 4th, he was received from a field hospital into Frederick Hospital No. 5, whence he was transferred to Patterson Park, Baltimore. On October 9th, Medical Cadet A. T. Piek furnished the following history: "The arm was amputated, on the battlefield, near the superior third of the humerus. The patient was suffering exceedingly, and on February 18, 1863, it was decided to open the stump, when a bulbous degeneration of the musculo-spiral nerve was discovered and removed by Surgeon S. D. Freeman, U. S. V. The patient now doing well." In the course of time, however, the tumor formed again, necessitating another operation for the removal of the enlarged bulbous extremity of the median nerve, which was performed by Surgeon Freeman, in September, 1863. Both of the specimens (*Cat. Surg. Sect.* 1866, p. 500, *Specs.* 1117 and 1790) were contributed to the Museum by the operator. The patient was subsequently transferred to the Veteran Reserve Corps, and on October 17, 1864, he was discharged from service and pensioned. In his application for commutation for an artificial limb, dated 1870, he describes the stump as being "in good condition." This pensioner was paid to June 4, 1875.

Laceration of the soft parts by large projectiles frequently demanded amputation high up, in cases in which the comminution of bone was limited to the lower portion of the shaft of the humerus:

FIG. 515.—Grapeshot comminution of the lower third of the left humerus. *Spec.* 688.

CASE 1648.—Corporal T. W. Stocksleger, Co. H, 47th Pennsylvania, aged 21 years, was wounded at Pocotaligo, October 22, 1862, and admitted into hospital at Hilton Head on the following day. Assistant Surgeon J. E. Semple, U. S. A., contributed the specimen represented in the wood-cut (FIG. 515), with the following history by Acting Assistant Surgeon T. T. Smiley: "Was wounded by a shot, which struck the anterior face of the left arm about two inches above the elbow joint, and passed obliquely upward and backward, coming out about two inches higher up than the point of entrance. The bone was extensively fractured, comminuted, and splintered, and it was therefore determined to amputate the limb. The operation was performed by the circular method, immediately above the highest point of the injury, and the patient is doing well." The specimen consists of the lower half of the left humerus, greatly comminuted at the lower third. The patient was discharged from service on December 15, 1862, and pensioned. He has been paid to March 4, 1875. In his application for commutation for artificial limb, dated 1870, the pensioner describes the stump of his left arm as "one and a half inches long from the shoulder, and in healthy condition."

Eighty-nine of the eleven hundred and fifty-five amputations were practised on Confederate soldiers. There was the usual predominance of operations on the left extremity. This circumstance was specified in all but seventeen cases. Five hundred and fifty-five amputations were recorded on the right, and five hundred and eighty-three on the left side. Nine hundred and ninety-two patients were discharged, seventy-four returned to modified duty, and eighty-nine were paroled, exchanged, or furloughed, and subsequently unaccounted for. Two hundred and ninety-three amputations were by the circular, and five hundred and fifty-five by the flap or modified flap method. In three hundred and seven cases the mode of operation was not recorded.

TABLE LXVI.

Condensed Summary of Eleven Hundred and Fifty-five Cases of Recovery after Primary Amputation in the Upper Third of the Shaft of the Humerus.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Ackerman, T., Corp'l, B, 51st Penn., age 22.	July 30, 39, '64.	Left; circular; by Surg. W. C. Shurlock, 51st Penn. Disch'd Mar. 17, 1865; pensioned.
2	Adams, T. C., 1st Lieut., B, 121st N. Y., age 33.	May 12, 12, '64.	Left; circular. Disch'd Oct. 17, 1864; pensioned.
3	Adams, J., Pt., A, 39th Mass., age 46.	May 8, 9, '64.	Left; circular; by Surgeon Wm. Thorndike, 39th Mass. Disch'd Jan. 20, 1865; pensioned.
4	Ahlers, A., Lieut., C, 47th Ohio, age 28.	July 22, 22, '64.	Left; by Surg. S. P. Bonner, 47th Ohio. Disch'd Jan. 25, 1865; pensioned.
5	*Ailiff, P. C.*, Pt., G, 28th Virginia.	July –, 1863.	Paroled August 22, 1863.
6	Aisenhood, A., Pt., G, 4th Michigan.	May 5, 6, '63.	Left; flap; by Asst. Surg. L. C. French, 4th Mich. Disch'd Sept. 29, 1863; pensioned.
7	Aitken, J. S., Pt., D, 2d N. Y. Heavy Artillery, age 19.	June 3, 4, '64.	Left; bilateral flap; by Surg. J. W. Wishart, 140th Penn. To V. R. C. May 2, 1865; pensioned.
8	Aldrich, J. B., Pt., E, 4th Vermont, age 45.	May 5, 5, '64.	Right; lateral flap; by Surg. D. M. Goodwin, 3d Vt. Disch'd August 17, 1865; pensioned.
9	Allen, H. C., Pt., E, 1st Mass. Cav., age 19.	Sept. 14, 14, '63.	Right; circular; by Surg. W. B. Hezlen, 3d Penn. Cav. Disch'd Nov. 8, 1863; pensioned.
10	Allen, F. M., Corp'l, A, 29th Maine, age 23.	Oct. 19, 21, '64.	Left; circular; by Asst. Surg. B. Fordyce, 160th N. Y. Disch'd Mar. 6, 1865; pensioned.
11	Allen, P., Pt., C, 5th Mich., age 40.	May 6, 6, '64.	Left; by Surg. H. F. Lyster, 5th Michigan; pensioned.
12	Allen, T. B., Pt., E, 43d Missouri.	Oct. 15, 15, '64.	Right. Discharged June 6, 1865; pensioned.
13	Allen, J., Lieut., E, 5th Mich. Cav., age 25.	Sept. 19, 19, '64.	Left; by Surg. A. K. St. Clair, 5th Mich. Cavalry. Disch'd April 5, 1865; pensioned.
14	Allgower, C. F., Pt., C, 6th New York.	April 17, 17, '63.	Left. Discharged May 29, 1863; pensioned.
15	Amann, C., Pt., C, 41st New York, age 18.	July 2, 2, '63.	Right; flap. Disch'd; pensioned.
16	Ambler, J., Pt., F, 170th New York, age 29.	May 18, 18, '64.	Right; flap; by Surgeon M. F. Reagan, 164th N. Y. Disch'd June 5, 1865.
17	Anderson, J., Pt., B, 10th Illinois, age 29.	May 27, 27, '64.	Left; by Surg. H. R. Payne, 10th Illinois. Disch'd; pensioned.
18	Anderson, G., Pt., C, 5th Conn.	Oct. 17, 18, '63.	Right; flap; by A. Surg. J. E. Link, 21st Ill. Disch'd July 21, 1864.
19	Andrews, J., Pt., A, 49th Penn., age 30.	May 10, 10, '64.	Left; antero-posterior flap. Discharged May 18, 1865; pensioned.
20	Anderson, P., Pt., I, 90th Penn., age 48.	May 10, 10, '64.	Left; antero-posterior flap; by Surg. J. H. Beach, 24th Mich. Disch'd April 29, 1865; pensioned.
21	Anderson, A., Pt., I, 100th Ohio.	June 11, 12, '64.	Left; circular; by Surgeon G. A. Collamore, 100th Ohio. Disch'd Feb. 17, 1865; pensioned.
22	Annis, E. E., Serg't, G, 64th N. Y., age 31.	June 1, 1, '62.	Right; flap. Discharged July 29, 1862.
23	Anthon, F., Pt., F, 7th Indiana Cavalry, age 19.	Dec. 2, 2, '64.	Left; circular; by A. A. Surg. J. A. Edmunson. Disch'd May 10, 1865; pensioned.
24	Armstrong, J., Pt., G, 140th Pennsylvania.	May 3, 3, '63.	Flap; by Surgeon J. W. Wishart, 140th Penn. Disch'd Aug. 10, 1863; pensioned.
25	Armstrong, W. A., Pt., G, 24th Mich., age 21.	July 1, 2, '63.	Right. Disch'd Nov. 26, 1863.
26	Arnold, J., Pt., C, 17th U. S. C. T., age 19.	Dec. 16, 16, '64.	Right; flap; by A. A. Surg. A. S. Giltner. Disch'd July 11, 1865; pensioned.
27	Auld, J. B., Pt., A, 5th Maine.	Nov. 7, 8, '63.	Right; flap. Disch'd April 14, 1864; pensioned.
28	Avery, Chas. E., Pt., A, 20th Maine.	May 5, 6, '64.	Right; circular. Disch'd June 15, 1865; pensioned.
29	Aydt, J., Pt., A, 68th New York.	May 2, 4, '63.	Left; flap; by Surg. L. Schultz, 68th N. Y. Disc'd July 17, 1863; pens'd.
30	Bael, L., Pt., K, 26th Penn., age 23.	May 15, 15, '64.	Right; circular. Disch'd June 25, 1865.
31	Bagley, C. R., Pt., E, 20th Connecticut.	May 3, 3, '63.	Left. Disch'd August 11, 1865; pensioned.
32	Bagaley, T., Capt., K, 63d Pennsylvania.	June 30, 30, '62.	Right. Discharged Dec. 15, 1862; pensioned.
33	Bailey, H. C., Pt., G, Kane's Penn. Rifles.	June 6, 6, '62.	Left. Discharged and pensioned.
34	Baker, J., Pt., B, 68th Penn., age 38.	Nov. 27, 27, '63.	By Surg. H. F. Lyster, 5th Mich. Discharged March 25, 1865; pensioned.
35	Baker, H. L., Pt., E, 2d Vermont, age 24.	May 6, 7, '64.	Left; circular; by Surgeon W. J. Sawin, 2d Vermont. Discharged June 29, 1864; pensioned.
36	B——, S., Pt., D, 111th Penn., age 31.	July 20, 20, '64.	Left; circular. Disch'd April 2, 1865.
37	Baker, J., Pt., G, 7th N. Y. Heavy Artillery.	May 30, 30, '64.	Left; flap; by Surg. G. L. Potter, 145th Penn. Disch'd Sept. 15, 1865; pensioned. *Spec.* 2951.
38	Baker, H., Pt., I, 12th Mass., age 30.	May 6, 6, '64.	Left; lateral flap; by Surg. P. E. Hubon, 28th Mass. Discharged July 19, 1864; pensioned.
39	Baker, G. W., Pt., G, 19th Wisconsin, age 31.	Aug. 7, 7, '64.	Right; flap; by Asst. Surg. E. F. Dodge, 19th Wis. Disch'd Mar. 28, 1865; pensioned.
40	Baldwin, W. M., Capt., D, 14th N. Y. S. M., age 32.	May 10, 10, '64.	Left; circular. Duty; pensioned.
41	Balde, F., Corp'l, D, 75th Pennsylvania.	July 1, 1, '63.	Left; circular. Disch'd May 11, 1864; pensioned.
42	Balch, W. L., Pt., G, 19th Indiana, age 30.	June 25, 25, '64.	Left; semi-circular and posterior flap; by Surg. J. Ebersole, 19th Ind. Disch'd Dec. 2, 1864; pens'd.
43	Ball, J. A., Corp'l, D, 23d New York.	Sept. 17, 17, '62.	Right; by Surgeon W. A. Madill, 23d N. Y. Disch'd Nov. 27, 1862; pensioned.
44	Bandell, H. C., Pt., A, 38th Mass.	April 13, 13, '63.	Left; circular; by Surgeon S. C. Hartwell, 38th Mass. Disch'd Aug. 4, 1863; pensioned.
45	*Banks, R.*, Serg't, D, 6th Virginia, age 27.	July 30, 30, '64.	Right; circular. Furloughed Sept. 27, 1864.
46	Bane, J., Pt., I, 104th Ill., age 19.	Sept. 19, 19, '63.	Right; flap; by Surg. R. F. Dyer, 104th Ill. Disch'd May 1, 1864.
47	*Barnes, T.*, Pt., Bowen's Battery, age 28.	Nov. 30, Dec. 1, 1864.	Left; circular. Transferred to Provost Marshal April 6, 1865.

1127	Williams, B., Serg't, K, 66th Illinois, age 25.	Aug. 11, 12, '64.	Right; flap; by Surg. J. Pogue, 66th Ill. Disch'd May 9, 1865; pensioned.
1128	Williams, J., Serg't, A, 48th C. T., age 36.	April 2, 2, '65.	Left; ant.-posterior flaps. Disch'd May 20, 1865; pensioned.
1129	Wilmarth, B. S., Serg't, D, 64th New York.	Dec. 13, 14, '62.	Right; circular. Disch'd April 9, 1863.
1130	Wilmott, N. S., Serg't, A, 27th Conn.	Dec. 13, 13, '62.	Right; circular; by Surg. C. S. Wood, 66th N. Y. Disch'd Mar. 11, 1863; pensioned.
1131	Wilson, J. B., Pt., A, 7th Wisconsin, age 39.	May 23, 23, '64.	Right; flap; by Surg. J. H. Beach, 25th Mich. Disch'd March 29, 1865; pensioned.
1132	Wilson, J. F., Pt., K, 18th Missouri.	April 6, 7, '62.	Left. Discharged; pensioned.
1133	Wilson, J. W., 2d Lieut., H, 57th Ind., age 25.	May 27, 27, '64.	Right; flap; by Surg. E. B. Glick, 40th Ind. Disch'd Dec. 21, 1864; pensioned.
1134	Winchester, R. A., Pt., D, 111th Penn.	Sept. 17, 19, '62.	Right. Disch'd Dec. 22, 1862; pensioned.
1135	Wirth, J., Corp'l, H, 6th Wisconsin.	Aug. 28, 30, '62.	Right. Disch'd October 23, 1862; pensioned.
1136	Wolfe, M., Pt., A, 50th Penn., age 26.	May 9, 9, '64.	Left; circular; by Surg. W. C. Shurlock, 51st Penn. Disch'd July 6, 1864; pensioned.
1137	Wollert, A., Pt., I, 108th New York.	May 1, 2, '63.	Right; flap. Disch'd July 24, 1863; pensioned.
1138	Wood, C. H., Pt., D, 53d Pennsylvania, age 19.	Mar. 31, 31, '65.	Left; circular. Disch'd July 5, 1865; pensioned.
1139	W———, H., Pt., H, 1st Mass. H. A., age 23.	Oct. 1, 2, '64.	Right; flap; by Surg. O. Evarts, 20th Ind. Disch'd April 3, 1865; pensioned. *Spec.* 4123.
1140	Wood, R., Pt., B, 10th Infantry, age 40.	May 24, 25, '64.	Right; flap; by Surg. R. T. Paine, 2d N. Y. M. R. Disch'd July 12, 1865; pensioned. *Spec.* 4352.
1141	Woods, J., Pt., C, 7th Missouri.	May 22, 22, '63.	Right; flap. Discharged Sept. 9, 1863.
1142	Woody, A., Pt., E, 14th Pennsylvania Cavalry.	Aug. 24, 26, '63.	Right; by Surg. W. B. Wynne, 14th Penn. Cav. Disch'd Jan. 26, 1864; pensioned.
1143	*Woolesey, G. W.*, Pt., G, 1st Tenn., age 23.	Nov. 30, Dec. 1, 1864.	Left; circular; by Surg. J. R. Buist, 10th Tenn. Transferred to Provost Marshal January 23, 1865.
1144	Wooley, G. A., Pt., F, 1st U. S. S. S., age 22.	July 3, 3, '63.	Right; flap. Discharged Jan. 11, 1864; pensioned.
1145	Woolford, T., Pt., D, 7th Colored Troops, age 22.	Sept. 29, 29, '64.	Left; ant.-post. flap. Discharged April 17, 1865; pensioned.
1146	Wright, C., Pt., I, 2d Conn. H'vy Art., age 26.	Oct. 19, 20, '64.	Right; flap; by Surg. H. Plumb, 2d Connecticut Heavy Artillery. Discharged January 20, 1865; pensioned.
1147	Wright, F. M., Pt., A, 71st Indiana.	Aug. 30, 30, '62.	Right. Disch'd Nov. 21, 1862; pensioned.
1148	Wright, J. N., Pt., I, 98th New York.	June 1, 1, '64.	Right. Disch'd Aug. 22, 1864.
1149	Wyman, H. F., Pt., A, 3d Vermont, age 24.	May 12, 13, '64.	Left; double flap; by Surg. D. M. Goodwin, 3d Vt. Discharged Oct. 31, 1864; pensioned.
1150	Yokes, W., Pt., C, 29th Ohio, age 32.	May 8, 10, '64.	Right; antero-posterior flap; by Asst Surg. C. C. Byrne, U. S. A. (Excision of radius May 8th.) Disch'd Sept. 1, 1864; pensioned.
1151	Youles, A., Pt., H, 45th Illinois.	April 6, 6, '62.	Right. Disch'd July 12, 1862; pensioned.
1152	Young, A. H., Pt., A, 6th Wisconsin.	Sept. 17, 17, '62.	Left; (also amputation of right forearm;) by Surg. J. McNulty, U. S. V. Discharged Nov. 16, 1863; pensioned.
1153	Young, H., Pt., C, 1st Maine Cavalry.	June 19, 19, '63.	Right. Discharged Nov. 17, 1863; pensioned.
1154	Young, W. S., Pt., A, 11th Kentucky.	Jan. 2, 3, '63.	Right. Discharged; pensioned.
1155	Zwang, J., Pt., B, 7th N. Y. H'vy Art., age 32.	June 3, 3, '64.	Right; circular; by Surg. G. L. Potter. 145th Pa. Disch'd Sept. 27, 1864.

The series includes one case of primary amputations of both arms in the upper thirds; a similar fatal case will be noticed hereafter.

Case 1649.—Private J. F. Hodgdon, Co. I, 11th Massachusetts, aged 21 years, received a severe injury of both arms by the premature discharge of a cannon at Winchester, June 14, 1863. He remained for some weeks at Winchester, where both his arms were amputated on the day of injury. On July 29th, he reached Harper's Ferry Hospital, and on the following day he entered Jarvis Hospital, at Baltimore. Assistant Surgeon D. C. Peters, U. S. A., noted: "Amputation of both arms." On August 27th, the patient was transferred to Mason Hospital, at Boston, whence he was discharged on September 10, 1863, and pensioned. In February, 1871, an account of this case was communicated by Dr. T. C. Smith, of Middleport, Ohio, late Surgeon 116th Ohio, as follows: "During the engagement at Winchester, June 14, 1863, Private Hodgdon had both arms torn off to the elbow by the premature discharge of a gun, which also caused the lower halves of the humeri to be fractured in several places, and the surrounding flesh to be fearfully burnt and torn into shreds. The tongue, eyes, face, neck, and anterior part of the chest were all frightfully burned, and powder driven into the flesh. Over nearly all this surface the skin was destroyed. At first he was left for dead; but signs of animation soon became manifest, and he was then carried to my regimental hospital, where stimulants and cold water were freely used, and reaction was soon established. He was a very large, robust, and powerfully muscled man. Assistant Surgeon M. F. Bowes, 12th Pennsylvania Cavalry, at first had him in charge. After reaction became established he was chloroformed, and Dr. Bowes amputated the right arm and I the left at the same time, both near the shoulder joints. There was very slight loss of blood. Stimulants were used freely, and he reacted rapidly from the effects of the chloroform and the operation. The accident occurred at one o'clock P. M., and the operations were completed and the stumps dressed by six o'clock P. M. At seven o'clock P. M., when we were driven from our position too rapidly to save anything, I had him carried to a distant house. Being among the captured medical officers, I obtained a pass and permission to search for him on the 16th. I found him as I had left him, under the shade of a large tree, the residents having supplied a little food and plenty of water. I then had him, with others, conveyed to the hospital in Winchester, where, with careful nursing, good feeding, and tonics, he made a rapid recovery. One year later, I learned from a reliable source that he was well, and had an apparatus fixed by which he was enabled to peddle about the vicinity for a livelihood. Dr. Bowes kindly assisted me at various times with the case." In a statement of artificial arms furnished by Mr. Lincoln, of Boston, in February, 1864, both amputations are described as having been performed by the "circular method." The pensioner died on June 30, 1871, eight years after the operation. The immediate cause of his death is not known.

There were also practised, simultaneously with the arm amputations, in five instances, amputations of the opposite forearm,—in one, an amputation through the wrist joint,—in two, amputations in the thigh,—and amputations of the leg, great toe, and thumb, each in one case. Altogether there were fifty-seven cases in which serious wounds had been received elsewhere than in the mutilated arm.

Among the recoveries were also numerous instances in which the patients survived consecutive operations. Thus, five underwent secondary amputation at the shoulder joint,[1] and have already been enumerated in Table XLVIII. There were two successful ulterior thigh amputations,—one for shot fracture, one for compound fracture from a railroad accident. There were several important ligations. In eight cases osteomyelitis resulted favorably, with the elimination or extraction of long tubular sequestra. The following is one of these examples:

Case 1650.—Private R. Wood, Co. D, 20th U. S. Infantry, aged 40 years, was wounded at North Anna, May 24, 1864, and received into the field hospital, 1st division, Ninth Corps. Surgeon M. K. Hogan, U. S. V., recorded: "Right forearm blown off; upper arm amputated." On May 29th, the wounded man reached Mt. Pleasant Hospital, at Washington. Assistant Surgeon C. A. McCall, U. S. A., reported: "Gunshot wound of right arm. Flap amputation at upper third performed, on the field, by Surgeon R. T. Paine, 2d New York Mounted Rifles. Progress favorable." The patient was transferred, on August 26th, to Fort Columbus, New York Harbor, where he subsequently entered the Post Hospital. On March 25, 1865, Assistant Surgeon P. S. Conner, U. S. A., removed the specimen, which he contributed to the Museum, and which is represented in the annexed wood-cut (Fig. 516), consisting of a sequestrum four inches long, removed from the face of the stump. The patient was discharged from service on July 12, 1865, and pensioned. He has not been heard from since September 4, 1868.

Fig. 516.—Cylindrical sequestrum after amputation (right arm for shot injury. *Spec.* 4352.

There were twenty instances of grave secondary hæmorrhage among the successful primary amputations at the upper third, seven requiring ligature of main arterial trunks, several others treated by torsion or ligature of the circumflex or other branches of the axillary, and several controlled by pressure and styptics.

[1] Cases of Cochran, Collins, Dahl, Frain, and Powers, pp. 647–8.

There were, in this series, three instances of consecutive ligation of the *subclavian*. One of these is here detailed; and the others will be again noticed in the section on ligations, in the future Chapter on Hæmorrhage:

Case 1651.—Private E. S. Kellogg, Co. A, 89th New York, aged 21 years, was wounded at Petersburg, June 18, 1864. Two days afterward he was received into hospital at Fort Monroe, whence Assistant Surgeon E. McClellan, U. S. A., reported: "Amputation of left arm at upper third." On July 6th, the patient entered the Christian Street Hospital, at Philadelphia. Acting Assistant Surgeon R. J. Levis reported: "Gunshot wound of left arm. Amputation by flap method was performed the day after the injury. The stump commenced to slough badly, involving the main artery, causing recurring hæmorrhage for several hours on July 25th, and necessitating ligation of the axillary artery. This was performed at the second portion of the vessel by Acting Assistant Surgeon G. B. Boyd, ether being used, and prompt reaction following. The stump became healthy in appearance, and the patient did well until August 8th, when hæmorrhage occurred from the point of ligation. Acting Assistant Surgeon R. J. Levis then ligated the subclavian artery over the first rib. Ether was again used at this operation, and reaction was very slow. No further hæmorrhage took place until August 15th, when another attack was controlled by plug, iron, pressure, etc." On September 30th, the patient was transferred to South Street Hospital, whence he was discharged on April 6, 1865, and pensioned. In his application for commutation of artificial limb he stated that Surgeon T. H. Squire, 89th New York, performed the amputation upon his arm. Examiner W. W. Potter, Washington, D. C., March 6, 1871, certified: "Physical condition not good. Has sustained amputation at the middle third of the left arm. Secondary hæmorrhage occurred, and it became necessary to ligate the axillary artery; the ligature sloughed and the subclavian was tied. This operation only succeeded in saving his life through the indefatigable attentions of an assistant, who compressed the artery for six weeks." Examiner J. G. Orton, of Binghamton, New York, subsequently reported: "Has much pain in parts, vertigo, and loss of blood from mouth upon any exertion; he is unable to do anything by manual labor for his support." The pensioner was paid June 4, 1875.

Fig. 517.—Double shot fractures of the humerus and radius. *Spec.* 3227.

There were also, among the successful upper-third amputations, four instances of successful ligation of the *brachial* for consecutive bleeding.[1]

Gangrene proved a serious complication in fifteen cases.[2] The following is an example, illustrating, in addition, double shot perforations of the shaft and elbow joint:

Case 1652.—Private P. Martin, Co. A, 5th New Jersey, aged 27 years, was wounded in the left arm, at Spottsylvania, May 10, 1864. The injured limb was amputated at a field hospital, on the following day, by Surgeon C. C. Jewett, 16th Mass. The specimen (Fig. 517) was contributed to the Museum by the operator, and consists of "the lower half of the right humerus and the upper portions of the bones of the forearm; the inferior portion of the outer condyle and the anterior face of the head of the radius are fractured, and the humerus is comminuted at the junction of the lower thirds. The injuries appear to have been inflicted by separate missiles, probably fragments of shell." (*Cat. Surg. Sect.*, 1866, p. 147.) On May 14th, the patient reached King Street Hospital, Alexandria, where Surgeon E. Bentley, U. S. V., recorded the following details of the case: "Amputation of left arm at upper third, performed on the field. May 16th, parts of flap gangrenous. May 18th, line of demarkation forming. May 23d, portion sloughed off. May 29th, doing well; has severe pain at times. Opiates and water dressings used. June 10th, doing well. June 28th, last ligature came away." On June 29th, the patient was transferred to Philadelphia, where he was treated at Christian Street and Broad and Cherry Streets Hospitals. Subsequently he entered Ward Hospital, Newark, and lastly, on April 4, 1865, he was admitted to Central Park Hospital, New York City. Surgeon J. J. Milhau, U. S. A., reported: "Gunshot wound of left elbow joint. Flap amputation at junction of upper and middle thirds. Chloroform used. Wound healed on admission." The patient was discharged on June 16, 1865, and pensioned. He was paid June 4, 1875. In his application for commutation for an artificial limb, in 1870, the pensioner says "the stump remains very painful."

In the eleven hundred and fifty-five recoveries from primary amputation at the upper third of the arm for shot injury above noticed, the wounds were inflicted by large projectiles in about one case in nine.[3] In fifty-seven cases, the wound of the arm was complicated by grave injury in some other region. Pathological specimens from twenty-six of the cases, and photographs of twenty-three, are deposited in the Museum.[4] Among the survivors of this operation, the number of deaths after discharge is remarkably small.[5]

[1] Cases of Boynton (112), Goodwin (426), McGraw (688), and Philbrick (819).

[2] Cases of Aydt (23), Basom (57), Bissell (87), Boynton (112), Findley (367), A. K. Goodwin (426), Jordan (556), Jukes (568), Kellogg (574), Knapp (600), Mason (663), Neal (765), Shelton (938), Warren (1090), and Wyman (1149).

[3] The reports specify the causes of injury as follows: By large solid cannon shot, 15; by shell fragments, 91; by grape, canister, or shrapnel, 17; by bursting of cannon, 2; by premature explosion of cannon, 4; by mine explosion, 1; by musket, carbine, pistol, or other small projectiles, 1025.

[4] Six of the specimens are figured with the text. The numbers of the specimens are noted in the table. The photographs illustrate cases 8, 188, 235, 249, 306, 348, 414, 422, 442, 450, 507, 509, 526, 551, 561, 660, 785, 869, 892, 935, 1099, 1148, 1138.

[5] Only eight deaths have come to the knowledge of this Office, among the survivors of primary amputation at the upper third for shot injury. Major J. W. Crosby, 61st Pennsylvania (Case 216), was killed in action April 2, 1865.

Fatal Cases.—Of the thirteen hundred and thirty-eight primary amputations in the upper third of the arm after shot injury, one hundred and eighty-three had fatal terminations. A few instances are detailed:

FIG. 518.—Comminution of the left humerus by a musket ball. *Spec.* 3952.

CASE 1653.—Private *J. P*———, Co. A, 12th Georgia, aged 19 years, was wounded at Monocacy, July 10, 1864, and was conveyed to Frederick. Assistant Surgeon R. F. Weir reported his admission to the general hospital on the same day with a bad shot comminution of the left humerus. He was in poor health, suffering from the effects of chronic diarrhœa. After the administration of restoratives and a period of rest under supporting treatment, on July 12th Acting Assistant Surgeon T. E. Mitchell amputated the arm at the upper third by double flaps. "The diarrhœa was very troublesome, though every effort was made to relieve him by the use of tonics, astringents, and stimulants. The stump commenced sloughing soon after the amputation, and continued to do so for nearly two weeks, until the bone protruded about two inches. In the early part of August there was some amelioration in the diarrhœa, but he had a distressing cough, and chills daily, from August 12th to 15th, evidently due, as the sequal proved, to pyæmic infection. He had cod-liver oil, milk punch, and other stimulants, but steadily grew worse, and died August 21, 1864. At the autopsy, made twelve hours after death, the right lung was found to abound with metastatic abscesses, and in the left there was diffused tuberculous deposit." Dr. Mitchell presented to the Army Medical Museum the preparation of the shattered humerus represented by the annexed wood-cut (FIG. 518). It is a good example of the longitudinal fissuring frequently inflicted in this region by conoidal balls.

A successful case of amputation of both arms in the upper thirds has been cited on page 715; in a similar case, death resulted two months after the operation:

CASE 1654.—Private W. Bawn, Co. G, 16th Maine, aged 26 years, was wounded at Fredericksburg, December 13, 1862. He was admitted into the hospital of the 2d division, First Corps. Assistant Surgeon H. Allen, U. S. A., reported: "Patient was wounded by a shell in the right arm and by a minié ball in the left arm. Both arms were amputated on the field, December 14th, at the junction of the upper and middle thirds. He was much exposed until December 23d, when admitted to Lincoln Hospital. He was then doing well, with the stumps nearly healed, had good appetite and spirits, and sat up all day. He remained so for two weeks, and then suddenly, without any apparent cause, had a slight chill and began to decline. Ordered tonics, with wine and cordial stimulants. He remained about the same, with but little change. January 20th, has had slight rigors, being restless and delirious at times, with all the symptoms of irritative fever. Fluctuations were discovered over the nates, and two abscesses being opened discharged freely. Tongue dry and brown. Mineral acids and tonics ordered freely, with nourishing diet, beef tea, milk punch, etc. Not much improved; abscesses continue discharging; pus burrowing beneath the gluteal muscles; profuse perspiration day and night, with slight rigors at times, and occasional troublesome delirium. Continued stimulants and supporting treatment. Sinuses laid open as soon as discovered. Patient passed stools involuntarily. The integument over the sacrum and gluteal regions looked badly, and the sloughing in a few days assumed a gangrenous character. Fermenting poultices applied. February 10th, perspiration not so profuse; no rigors; delirium ceased. In a few days the integument over the entire sacrum and part of the gluteal region had sloughed away; the surface, though still discharging, was much improved, also the constitutional symptoms. There was no disposition, however, to granulate and heal. Mineral tonics were continued freely, and good diet. The ulcers again become gangrenous, perspiration profuse, delirium set in, and the patient sank rapidly. He died on February 22, 1863. The *post-mortem* examination was made forty hours after death. The subject was five feet eight inches tall, and was at this time emaciated and moderately rigid. The brain weighed forty-eight ounces, was light colored and firm. The right lung weighed fourteen ounces, the left lung eleven and one-quarter ounces. The whole of the right lung and the second lobe of the left lung were in a state of incipient tubercular degeneration. Two masses of diseased lobules (consolidated) were found in the lower part of the second portion of the left lung. The melanic matter upon the first lobe of the same lung was ribbed. The bronchi were slightly congested in this case, and the bronchial glands were black. The heart weighed ten and one-quarter ounces; the external adipose tissue was abundant. The substance of the organ was firm and of a pale color; the valves were slightly thickened and opaque. About the junction of two of the segments of the aortic valve was a hard cartilaginous mass, lifting the valves from the side of the aorta and encroaching upon its calibre. In the place of the corpus arantii of the opposite valve was another mass whose section was cartilaginous and translucent, and which broke on pressure, discharging a clear gelatinous matter. The mesenteric glands were much enlarged. The mesocolic were large and black. Two ounces of a light-yellow bile was taken from the gall bladder. The liver weighed seventy-three ounces, and measured eleven and one-quarter by seven and a half by three and three-quarters inches. It was of a pinkish-brown color and firm consistence. It was mottled externally yellow and crimson with white stellar spots. The acini were distinct on a cut surface, but not on the torn. The spleen weighed ten and a half ounces, and measured six and a half by four and a half inches. Its color was light red and its consistence firm. Its trabiculæ were marked. The pancreas measured eight by one and one-quarter and five and three-quarters inches, and weighed three and one-quarter ounces. It was of firm consistence and natural color. The supra-renal capsules together weighed three-eighths of an ounce. They were large and of a burnt-ochre color. Each kidney weighed six and a half ounces, and measured four and a half by two and a half inches. They were of a light reddish slate color and firm consistence. The cortical lines were distinct. One or two small cysts were found in the anterior part of the right kidney. The fundus of the stomach was congested, and the mucous membrane was slightly soft in the duodenum. It was of a slate color and pitted near the pylorus. Throughout the small and large intestine the mucous lining was of a slate color, varied by bile, stained in the middle third of the jejunum. The first third of the ilium was purple, the second stained with bile, and the third

dark again, where also it was soft. In the ascending colon it was of a grayish green color. The valvulæ were marked throughout the intestine except in a patch of about six inches in the lower half of the ilium. The ilium was congested in its upper third. Tubercles were irregularly scattered in the lower third of the ilium from the smooth patch to the valve. In the large intestine, at the hepatic flexure, were two small ulcers with dark bases. Others with jagged edges were irregularly scattered through the large intestine, but principally grouped along the longitudinal bands. Some of these were one-quarter of an inch in diameter. In the rectum the rugæ were marked and covered with false membrane, under which was a great number of small ulcers. The intestines weighed fifty-three ounces. A very large bed-sore was found over the sacrum, leaving the spinous and transverse processes exposed. The ulceration extended to the posterior spines of the ilium. This sent two great wings down under the skin and fascia, which had opened over either trochanter major. Ulcers of the right hip and the main sore; another small and separated ulcer was found just above the first mentioned. With exception of the last, the openings were surrounded by black and discolored edges which looked as if gangrene would soon supervene."

FIG. 519.—Segment of shaft of right humerus shattered by a conoidal ball, which is attach'd. *Spec.* 4142.

Seventy-six patients succumbed within three weeks after operation.

CASE 1655.—Corporal G. H. G———, Co. K, 90th Pennsylvania, was wounded at Petersburg, June 19, 1864, in an assault of the Fifth Corps. He was taken to the field hospital of his division, the third, and Surgeon L. W. Read, U. S. V., reported a "shot wound of the back and arm, necessitating amputation of the latter a little below the surgical neck. The patient was sent to City Point on the following day." Surgeon W. L. Faxon, 32d Massachusetts, reported the patient's arrival at the depot hospital, and recorded the operator's name as Surgeon Joseph H. Hayes, 70th Pennsylvania. The progress of the case is not described. The patient died July 1, 1864. Surgeon Hayes contributed the specimen (FIG. 519) of the comminuted portion of the right humerus, with the missile that inflicted the injury attached. The comminution extends for six inches, and presents a fair example of the effects of the impact of a minié ball upon the compact tissue of the humerus when impinging at a comparatively moderate velocity.

The one hundred and eighty-three unsuccessful amputations at the upper third of the arm were practised on one hundred and eighty-two patients, of whom twenty-three were Confederates. The limb implicated was specified in one hundred and seventy cases, the operations on the *right* side being the most numerous (91 right, 79 left). Twenty-three cases were complicated by serious wounds in other regions, and in twenty-three other simultaneous or consecutive operations were practised.[1] Four patients died with tetanus and one with variola; but pyæmia or septicæmia were the most frequent causes of death.[2]

TABLE LXIX.

Condensed Summary of One Hundred and Eighty-three Unsuccessful Cases of Primary Amputation in the Upper Third of the Shaft of the Humerus.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Adams, J. C., Pt., K, 126th N. Y., age 26.	June 18, 18, '64.	Left; flap. Died July 26, 1864.	10	Bailey, D., Pt., C, 11th Penn., age 35.	June 2, 2, '64.	Left; circular. Died July 7, 1864, pyæmia.
2	*Alsbrook, H. H.*, Serg't, A, 19th Ga., age 23.	May 16, 17, '64.	Circular. Died June 13, 1864, pyæmia.	11	Bailey, I. K., I, 5th Cav., age 2).	June 9, 9, '63.	Right; (also removal of portion of tibia.) Died June 15, '63, pyæmia.
3	*Anders, W. M.*, Pt., C, 12th Georgia.	Mar. 25, 25, '65.	Left; by A. Surg. E. M. Smyser, 48th Penn. Died Mar. 27, 1865.	12	Baker, N. I., Pt., E, 12th N. H., age 18.	May 3, 3, '63.	Left; tetanus; re-amp. May 16. Died May 19, 1863, tetanus.
4	Andrews, C. N., Adj't, 85th Illinois, age 21.	June 27, 27, '64.	Left; by Surg. M. M. Hooten, 86th Ill.; re-amputation shoulder joint. Died July 23, 1864, gangrene.	13	Baldwin, H. M., Lieut., M, 5th Artillery.	Oct. 19, 20, '64.	Left; flap; by Surg. H. Plumb, 2d Conn. Art.; hæmor'age. (Pen. w'd thorax.) Died Nov. 9, toxæmia.
5	Armour, J. A., Lieut., F, 80th Illinois.	June 1, 1, '64.	By Surg. S. H. Kersey, 36th Ind. Died June 11, 1864.	14	Barker, J. H., Corp'l, E, 142d Penn., age 25.	May 12, 12, '64.	Left; ant.-post. flaps; hæmor.; lig. of brachial. Died June 1, 1864.
6	*Austin, D. M.*, Pt., I, 60th Virginia.	Sept. 19, 19, '64.	Circular. Died October 3, 1864, pyæmia.	15	Barton, J. H., Pt., K, 11th Conn., age 25.	June 18, 20, '64.	Right; flap. Died Aug. 8, 1864, pyæmia.
7	*B———, A*.....	Feb. 16, 18, '62.	Died Feb. 24, 1862, exhaustion.	16	*Bates, N. S.*, Pt., I, 19th Georgia, age 23.	Aug. 19, 19, '64.	Right; ant.-post. flap; by Sur. A. A. White, 8th Md. Died Sept. 9, '64.
8	Babcock, A. J., Serg't, H, 2d Mass.	July 3, 3, '63.	Left; flap. Died August 6, 1863.	17	Bawn, W., Pt., G, 16th Maine, age 26.	Dec. 13, 14, '62.	Both; junction of upper and middle thirds. Died Feb. 22, 1863.
9	Bacon, C., Private, D, 4th Colored Troops.	Feb. 14, '65.	Right; circular; by A. Surg. H. C. Merryweather, 5th C.T. Died February 21, 1865.	18			
				19	Beales, J. E., Pt., H, 148th Penn., age 19.	July 3, 3, '63.	Left; gangrene; hæmorrhage. Died Aug. 8, 1863, exhaustion.

[1] Unsuccessful excision in the forearm was essayed in one case; in another, the fingers of the opposite limb were amputated, and an attempt to excise the injured portion of the humerus was abandoned. The opposite forearm, in one case, the opposite arm in two cases, were removed at the time of the amputations here enumerated. Other simultaneous or subsequent operations included: 1 amputation of the thigh, 1 amputation of the leg, an excision of several inches of the tibia, a re-amputation at the shoulder, 2 re-amputations in the continuity, 4 ligations of the brachial, 2 ligations of the axillary, 2 ligations of the subclavian. The fatal double amputation in the case of Bawn is counted twice.

[2] The causes of death are recorded as: Pyæmia, 42 cases; exhaustion from suppurative or surgical fever, 25; erysipelas, 2; debility, 3; anæmia, 2; emaciation, 1; amputation of thigh, 1; tuberculosis, 2; small-pox, 1; typhoid fever, 2; pneumonia, 7; hydrothorax, 1; secondary hæmorrhage, 9; gangrene, 6; chronic diarrhœa, 6; tetanus, 4. In 68 cases the cause of death was not specified.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
20	Beard, G. G., Pt., G, 9th Maine.	Oct. 27, 27, '64.	Right; by Surg. D. McFalls, 142d New York. Died Nov. 20, 1864, exhaustion.
21	Beamen, J., Pt., D, 11th Conn., age 35.	Mar. 14, 14, '62.	Left; circ.; by Surg. G. Derby, 23d Mass. Died Ap'l 11, '62, pyæmia.
22	Bessey, J., Pt., K, 3d N. Y. Artillery, age 20.	June 30, 30, '64.	Right. Died July 28, 1864, tetanus.

31	Burt, A., Pt., I, 72d Ind.	May 27, 29, '64.	Left. Died June 25, 1864.
32	*C——, W. H.*, Pt., D, 12th Georgia, age 19.	July 9, 10, '64.	Right; circular; by A. A. Surg. T. E. Mitchell. Died July 22, 1864, pyæmia. *Spec.* 3820.
33	C——, N. W., Pt., E, 7th N. Y. H. A., age 16.	June 18, 18, '64.	Left; ant.-post. flap. Died July 20, 1864. (Excision of bone of forearm.) *Spec.* 488.
34	*Caffey, H. P.*, Pt., H, 3d Alabama, age 26.	July 3, 3, '63.	Right; circular; by Surg. J. M. Hayes, C. S. A. Died Sept. 13, 1863, exhaustion.
35	Cain, J. W., Pt., E, 20th Illinois.	April 6, 6, '62.	Erysipelatous inflammation. Died April 16, 1862.
36	Caman, M., Pt., C, 11th Penn., age 20.	May 8, 9, '64.	Right; circular; by A. Surg. W. F. Osborne, 11th Penn. Died May 27, 1864, pyæmia.
37	Canaran, A., Pt., C, 183d Penn., age 40.	Aug. 16, 16, '64.	Right; flap; by Surg. Williams, C. S. A. Died April 14, 1865, consumption.
38	Clark, R., Pt., D, 13th C. T., age 18.	Dec. 16, 16, '64.	Both; flap; right at upper and left at middle third; by A. A. Surg. J. S. Giltner. Died Dec. 19, '64.
39	Cole, C., Pt., A, 26th Mich.	June 3, 3, '64.	Right; by Surg. J. W. Wishart, 140th Penn. Died July 6, 1864.
40	Cooper, H., Corp'l, G, 97th Ohio.	June 22, 22, '64.	Left; by Surg. E. B. Glick, 40th Ind. Died July 12, 1864.
41	Corwin, J. H., Pt., M, 15th N. Y. H. A., age 25.	May 6, 6, '64.	Right; flap. Died June 21, 1864, typhoid fever.
42	Curran, F., Pt., D, 102d Penn., age 34.	May 5, 5, '64.	Left; oval flap; erysipelas. Died June 1, 1864, pyæmia.
43	Curran, T., Pt., H, 69th N. Y., age 20.	Sept. 16, 16, '62.	Left. Died Oct. 17, 1862, pyæmia.
44	Dale, E. H., Pt., K, 14th N. H.	Sept. 19, 19, '64.	Left; circular. Died Nov. 23, '64.
45	Dapple, M., Pt., E, 159th N. Y.	Sept. 19, 19, '64.	Right. Died.
46	*Davis, H. J.*, Pt., G, 3d N. C., age 41.	June 21, 22, '64.	Left; lateral flap; by Surg. J. W. Wishart, 140th Pa.; hæmorrh'ge. Died July 6, 1864.
47	Dart, C. C., Pt., A, 187th Pa., age 36.	June 16, 18, '64.	Right; flap. Died July 24, 1864, debility.
48	Dean, W. H., Pt., D, 49th Ohio, age 21.	May 27, 27, '64.	Right; circular. Died June 28, 1864, typhoid pneumonia.
49	Demorest, L., Pt., K, 179th New York, age 33.	April 2, 2, '65.	Right; circular; by Surg. J. C. Rutherford, 17th Vt. Died April 20, 1865, exhaustion.
50	Dennis, J. N., Pt., I, 153d Pa., age 43.	July 1, 1, '63.	Left; flap. Died July 19, 1863, effects of hæmorrhage.
51	Dingman, A. M., Pt., D, 4th Mich. Cav., age 20.	June 20, 22, '64.	Left; circular. Died Mar. 5, 1865, small-pox.
52	Downing, S., Pt., C, 9th Illinois Cav.	July 14, 15, '64.	Right; flap; gangrene; hæmorrhage; ligation of subclavian. Died Aug. 30, 1864. *Spec.* 2568.
53	Dudley, G. M., Serg't, K, 7th N. H., age 22.	Aug. 16, 16, '64.	Left; circular. Died Sept. 24, 1864, pyæmia.
54	*Dutton, L. J.*, Pt., A, 5th Virginia, age 22.	May 8, 8, '64.	Left; circular; pneumonia. Died June 11, 1864.
55	Dyer, A. O., Pt., G, 21st Mass.	Nov. 24, 24, '63.	Right; by Surg. A. M. Wilder, U. S. V. Died Dec. 6, 1863.
56	Ellis, L. E., Pt., L, 1st Mich. Cav., age 28.	May 6, 6, '64.	Right; lateral flap; by Asst. Surg. W. S. Willis, 1st N. J. Cavalry. Died Jan. 9, 1865, pyæmia.
57	Emerich, H., Pt., B, 20th New York.	Sept. 17, 17, '62.	Right. Died Oct. 23, 1862.
58	Emerson, J. S., Pt., C, 1st Maine Heavy Art., age 21.	June 18, 18, '64.	Left; circular; (wounds of chest, thigh, penis, etc.) Died June 30, 1864, exhaustion.
59	Fairchild, J. M., Pt., G, 10th N. Y. Cav., age 27.	June 11, 11, '64.	Right; circular. Died July 17, 1864.
60	Fales, J. A., Corp'l, K, 3d Vermont, age 32.	May 5, 5, '64.	Right; ant.-post. flap; by Surg. H. F. Lyster, 5th Mich. Died July 6, 1864, exhaustion.
61	*Farson, S.*, Pt., H, 1st Virginia, age 36.	July 3, 3, '63.	Left; (also fracture of leg.) Died Aug. 29, 1863, pyæmia.
62	Fitzpatrick, J. P., Pt., G, 52d New York, age 37.	May 18, 18, '64.	Left; ant.-post. flap; by A. Surg. J. T. Dutfield, 7th Ind.; hæmorrhage; ligation of brachial. Died June 4, 1864, pyæmia.
63	Follar, S. G., Serg't, G, 2d Ohio Cavalry, age 23.	May 7, 9, '64.	Right; circular. Died June 2, '64.
64	Foster, J. B., Pt., G, 83d New York, age 39.	May 6, 6, '64.	Right; flap; hæmorrhage. Died June 17, '64, typhoid pneumonia.
65	Foster, W., Pt., I, 5th N. Jersey, age 25.	June 16, 16, '64.	Left; flap. Died July 7, 1864.
66	*Fralic, W. J.*, Serg't, F, 25th S. C., age 32.	Aug. 21, 22, '64.	Left; flap. Died Sept. 11, 1864.
67	Frank C., Pt., D, 4th N. York Cavalry, age 20.	June 21, 21, '63.	Right; flap; hæmorrhage. Died July 16, 1863, pyæmia.
68	Freese, I. P., Pt., C, 138th Pa., age 29.	June 3, 5, '64.	Right; flap; (also wound of lung.) Died July 28, 1864, debility.
69	Fry, J. C., Pt., B, 60th Ohio.	May 26, 26, '64.	Right; by Surg. W. C. Shurlock, 51st Pa. Died June 2, 1864.
70	Fryer, J. F., Corp'l, A, 53d Penn., age 34.	June 3, 4, '64.	Right; circular; by Surg. G. L. Potter, 145th Pa.; hæmorrhage; lig. Died June 15, 1864, pyæmia.
71	Galbert, W. C., Corp'l, I, 33d Mass.	May 12, 13, '64.	Right; flap; (also wound of nates.) Died July 15, 1864.
72	G——, J. H., Corp'l, K, 96th Penn.	June 19, 19, '64.	Right. Died July 1, 1864. *Spec.* 4142.
73	*Goodson, H.*, Pt., Young's Battery, age 23.	Sept. 3, 3, '64.	Left. Died Sept. 16, 1864.
74	Graback, H., Pt., F, 8th Ohio, age 21.	May 5, 5, '64.	Right; circular; by Surg. D. W. Maull, 1st Del. Died June 7, 1864, exhaustion.
75	Graham, W., Pt., K, 67th Penn.	May 5, 5, '64.	Left. Died May 20, 1864.
76	*Gusset, S.*, Pt., F, 8th N. C., age 38.	Sept. 29, 30, '64.	Right; (also wound of left arm.) Died Oct. 11, 1864, exhaustion.
77	Hardendorf, Ra. Pt., E, 109th N. Y., age 21.	July 30, 30, '64.	Right; ant.-post. flap; by Surg. W. C. Shurlock, 51st Pa.; hæmorrhage. Died Sept. 3, '64, pyæmia.
78	Hardy, J. H., Pt., K, 66th Ohio.	June 17, 17, '64.	Right; bi-lateral flap; diarrhœa. Died June 21, 1864.
79	Henniken, J., Corp'l, G, 26th Illinois.	Aug. 17, 17, '64.	Right; by Surg. J. C. Hutchinson, 15th Mich. Died Aug. 30, 1864.
80	Hensey, J., Serg't, I, 74th Illinois.	May 15, 15, '64.	Right. Died June 16, 1864.
81	Heringen, O., Capt., F, 7th N. Y., age 39.	Dec. 13, 13, '62.	Right; flap. Died Jan. 30, 1863, pyæmia.
82	Heuser, M., Pt., G, 52d New York, age 29.	June 17, 17, '64.	Left; circ.; by Surg. G. L. Potter, 145th Pa. Died July 2, 1864, gangrene.
83	Hicks, H., Pt., B, 7th Michigan.	Sept. 19, 19, '64.	Left; oval skin flaps. Died Oct. 16, 1864, pyæmia.
84	Holland, H., Pt., K, 13th Colored Troops, age 21.	Dec. 17, 18, '64.	Right; flap; by A. A. Surg J. S. Giltner. Died Dec. 27, '64, gang'e.
85	Hubert, E. B., Serg't, K, 1st Me. Cav., age 26.	Dec. 10, 10, '64.	Right. Died Jan. 5, 1865, fever of a low typhoid type.
86	Humphrey, L., Pt., E, 4th Kentucky Cav., age 25.	June 26, 26, '63.	Died July 21, 1863, pyæmia.
87	Ihler, W. S., Music'n, D, 45th Ohio, age 22.	May 27, 27, '64.	Right; flap; hæmorrhage. Died Sept. 16, 1864.
88	*Jackson, T. J.*, Lieuten't General.	May 3, 3, '63.	Left; (brachial severed, also fracture of hand and contus'n of side.) Died May 10, 1863.
89	Johns, E. F., Pt., E, 57th Indiana.	May 27, 27, '64.	Left; by Surg. E. B. Glick, 40th Ind. Died July 1, 1864.
90	Johnson, D. F., Pt., D, 75th Indiana, age 21.	Sept. 19, 21, '63.	Right. Died Oct. 20, 1863, exhaustion and pyæmia.
91	Johnson, J., Corp'l, F, 21st New York.	Aug. 30, 30, '62.	Left; ant.-post. flap; by A. A. Surg. G. E. Fallen. Died Sept. 12, 1862, tetanus. *Spec.* 312.
92	Jones, T., Pt., C, 40th Mass., age 40.	May 16, 16, '64.	Right. Died March 18, 1865, pneumonia.
93	Joslin, E., Pt., B, 3d Rhode Island, age 35.	Sept. 16, 16, '64.	Left; ant.-post. flap; by A. A. Surg. W. Balser. Died Oct. 10, 1864, pyæmia.
94	Jullivett, M., Pt., D, 98th New York, age 19.	Sept. 29, 30, '64.	Left; by Surg. J. A. Bigelow, 8th Conn. (Amp. leg.) Died Oct. 9, 1864, exhaustion.
95	Keating, P., Serg't, H, 10th Minn.	April 3, 3, '65.	Left; by Asst. Surg. F. H. Milligan, 10th Minn. Died Ap'l 19, '65.
96	Keim, C. W., Serg't, E, 68th Penn.	July 3, 3, '63.	Left. Died July 12, 1863.
97	Kœnig, J., Pt., E, 17th Missouri.	May 14, 14, '64.	Right; flap; by Surg. B. N. Bond. 27th Mo. Died May 18, 1864.
98	*Laine, T. G.*, Capt., G, 4th Georgia, age 30.	July 1, 1, '63.	Left; circular. Died July 25, 1863, diarrhœa. *Spec.* 3821.
99	*Lary, L. H.*, Pt., Harris's Battery, age 35	May 26, 28, '64.	Circular. Died June 10, 1864, pyæmia.
100	Lee, I. B., Pt., H, 125th New York, age 21.	May 12, 12, '64.	Left; circular; by Surg. J. W. Wishart, 140th Pa. Died June 12, 1864, pyæmia.
101	LeFevre, A., Pt., F, 5th Minn., age 18.	Dec. 16, 16, '64.	Left; antero-posterior flap. Died Jan. 7, 1865.
102	Lewis, G., Pt., I, 12th Colored Troops, age 28.	Dec. 14, 15, '64.	Right, flap; by A. A. Surg. J. S. Giltner. Died Dec. 24, 1864, pyæmia.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
103	Lewis, M. C., K, 96th New York.	Sept. 29, 29, '64.	Left; by Surg. T. H. Squires, 89th N. Y. (Prostrated with hæmorrhage.) Died one hour after operation.
104	Lincoln, S. F., Adj't, 126th New York, age 26.	June 16, 17, '64.	Left; circular; by Surg. J. W. Wishart, 140th Pa. Died July 9, 1864.
105	Logan, R. J., Serg't, D, 110th Illinois, age 28.	Mar. 18, 18, '65.	Left; circular. Died April 25, 1865, pyæmia.
106	Love, J., Serg't, A, 15th Iowa, age 26.	Mar. 21, 21, '65.	Right; flap; by Surg. T. P. Bond, 32d Ohio. Died July 20, 1865, chronic diarrhœa and wound.
107	Mackin, P., Pt., A, 69th New York, age 30.	June 1, 1, '62.	Left; flap; hæmorrhage. Died July 6, 1862.
108	McArnold, J., Pt., I, 20th Pennsylvania.	June 18, 18, '64.	Left; (also severe contusion of thorax.) Died June 19, 1864.
109	*McDonald, G.*, Corp'l, D, 4th Virginia Cavalry.	April 1, 1, '65.	Right. Died April 21, 1865.
110	McDowell, W., Pt., L, 27th Michigan.	July 19, 19, '64.	Right; by Surg. W. B. Fox, 8th Mich. Died July 24, 1864, exhaustion.
111	McGinniss, J., Pt., A, 23d Pennsylvania, age 22.	June 1, 2, '64.	Right; circular; by Surg. E. B. P. Kelly, 95th Pa. Died June 28, 1864, exhaustion.
112	McNulty, J. R., Pt., H, 1st N. J. Cav., age 28.	May 28, 29, '64.	Right; circ.; (primary excision;) gangrene. Died June 9, 1864.
113	Mesick, G. P., Pt., K, 10th Michigan.	Sept. 1, 1, '64.	Right. Died Sept. 20, 1864.
114	Middaugh, J., Pt., C, 109th N. Y., age 26.	June 17, 18, '64.	Left; circular. Died June 27, '64, double pneumonia.
115	Miller, A., Serg't, I, 9th Iowa.	May 12, 12, '63.	Left; flap; by Surgeon E. J. McGoorisk, 9th Iowa. Died July 10, 1863.
116	Miller, C. A., Corp'l, F, 27th Massachusetts.	June 15, 15, '64.	Left. Died July 19, 1864, exhaustion.
117	Mockre, J. W., Pt., B, 51st New York, age 37.	May 18, 19, '64.	Right; flap. Died Sept. 11, 1864, diarrhœa and exhaustion.
118	Morgan, W. B., Pt., F, 17th Conn., age 24.	July 3, 5, '63.	Left; flap; hæmorrhage. July 20, lig. axillary; gangrene. Aug. 3, re-ligation. Died Aug. 16, '63.
119	Morris, H. C., Corp'l, K, 39th New York, age 19.	May 18, 18, '64.	Right; circular; (also wounds of left arm and chest.) Died May 30, 1864, exhaustion.
120	Nelson, F. M., Pt., C, 150th Pennsylvania.	May 6, 6, '64.	Died May 6, 1864.
121	Newman, A., Pt., C, 140th Pennsylvania.	July 3, 3, '63.	Died August 13, 1863.
122	Nichols, W. J., Corp'l, D, 37th Mass., age 22.	May 6, 6, '64.	Right; circular. Died May 31, '64.
123	*Nickinson, A.*, Pt., G, 53d North Carolina.	July 3, 3, '63.	By Surg. C. S. Wood, 66th N. Y. (Also amp. thigh.) Died July 19, 1863.
124	Noecker, I. B., Serg't, C, 149th Pa., age 22.	May 12, 13, '64.	Left; circular; by Surgeon D. W. Maull, 1st Delaware. Died June 23, 1864.
125	O'Hara, M., Pt., E, 8th Conn., age 22.	June 1, 1, '64.	Right; circular. Died August 4, 1864, pyæmia.
126	Palmer, C. H., Pt., A, 10th Mich., age 23.	May 30, 30, '64.	Left; flap; by Surg. W. A. Gray, 60th Illinois; hæmorrhage. Died August 23, 1864, anæmia.
127	Palmer, H., Pt., E, 146th New York.	May 5, 5, '64.	Right. Died.
128	Pangborn, A., Pt., K, 62d Ohio, age 33.	April 6, 6, '65.	Left; flap; by Surg. J. S. Taylor, 23d Illinois. Died Aug. 24, 1865, diarrhœa.
129	Park, F. H., Capt., B, 4th Pa. Cav., age 24.	Aug. 23, 23, '64.	Right. Died Oct. 1, 1864.
130	Peterson, S. R., Pt., D, 14th Infantry, age 27.	May 3, 3, '63.	Left; circular; by Asst. Surg. B. Howard, U.S.A.; hæmorrhages; subclavian ligated. Died July 18, 1863, exhaustion. *Spec.* 2607.
131	*Peyton, T. W.*, Capt., A, Austin's Battalion S. S.	Dec. 31, '62, Jan. 1, '63.	Right. Died Feb. 7, 1863.
132	Phillips, W. L., Pt., F, 5th Wisconsin, age 20.	April 2, 2, '65.	Right. Died April 13, 1865, exhaustion.
133	Pierce, G. W., Pt., E, 149th N. Y.	May 15, 15, '64.	Right. Died June 10, 1864.
134	*Pinson, J.*, Pt., G, 12th Georgia, age 19.	July 10, 12, '64.	Right; circular; by A. A. Surg. T. E. Mitchell. Died Aug. 21, 1864, pyæmia. *Spec.* 3952.
135	Powell, J., Pt., F, 76th Pa., age 29.	July 30, 30, '64.	Left; flap. Died Aug. 28, 1864, exhaustion.
136	Powers, J. G., Serg't, C, 57th Mass.	July 30, 30, '64.	Left; circular; (also wounds of ribs and sternum. *Vide M. & S. H. W.*, Vol. II, pt. 1, p. 535.) Died Aug. 16, 1864.
137	Reagles, L., Pt., A, 64th New York, age 20.	Oct. 14, 14, '63.	Left; circular; by Surg. D. E. Kelsey, 64th N. Y. Died Oct. 20, 1863, hæmorrhage.
138	*Renfral, W.*, Lieut., H, 12th Georgia, age 24.	July 12, 12, '64.	Left; re-amputation July 30, 1864. Died Aug. 11, 1864.
139	Rheinhart, M., Pt., F, 85th Pa.	May 31, 31, '62.	Flap. Died July 9, 1862, pyæmia.
140	Roach, M., Pt., D, 9th Mass., age 23.	May 12, 12, '64.	Left; antero-posterior flap. Died June 20, 1864, pyæmia.
141	Roop, B., Corp'l, K, 21st Mich., age 23.	Mar. 22, 22, '65.	Right. Died April 24, 1865.
142	Rosen, J., Pt., D, 51st Pa.	Aug. 21, 21, '64.	Left. Died August 24, 1864.
143	Rosenberg, A., Pt., H, 7th New York, age 39.	Mar. 31, 31, '65.	Right; flap. Died April 13, '65, exhaustion.
144	Ross, J. W., Farrier, E, 1st Maine Cavalry.	April 6, 6, '65.	Right. Died April 17, 1865.
145	Rudisil, S., Corp'l, I, 50th Pennsylvania, age 35.	June 3, 3, '64.	Left; circular; by Surg. W. B. Fox, 8th Mich. Died July 12, 1864, pyæmia.
146	*Sadler, J. C.*, Pt., C, 19th Virginia.	May 12, 12, '64.	Flap; by A. Surg. Breckenridge, C. S. A. Died May 13, 1864.
147	Sayers, B. F., Pt., C, 114th Ill., age 34.	Feb. 15, 16, '65.	Right; circular; by A. Surg. W. M. Dooram, U. S. V. Died Feb. 26, 1865, tetanus.
148	Shanock, H. S., Pt., E, 90th Ohio.	Sept. 19, 19, '63.	Right. Died October 25, 1863, pyæmia.
149	Shemp, J. M., Corp'l, A, 199th Pa., age 25.	April 2, 2, '65.	Left; by Surg. T. H. Squire, 89th N. Y. Died May 4, 1865, effusion in chest.
150	Shuman, J. F., Pt., K, 4th Maine, age 22.	July 2, 4, '63.	Right. Died July 15, 1863, hæmorrhage.
151	Simont, W., Pt., F, 1st N. J., age 26.	May 5, 6, '64.	Left; lateral flap. Died July 22, 1864, gangrene.
152	Smith, A. C., Pt., D, 118th Pennsylvania.	Dec. 13, 13, '62.	Right. Died Jan. 4, '63, pyæmia.
153	Smith, J. G., Serg't, G, 12th Mass., age 37.	May 10, 12, '64.	Left; circular. Died June 7, '64, pyæmia.
154	Smith, P., Pt., G, 24th Wisconsin, age 19.	May 17, 18, '64.	Right; circular. Died Sept. 2, 1864, at home.
155	Stanhope, W., Pt., A, 9th Maine, age 27.	July 18, 20, '63.	Right; circular. Died August 28, 1863, pyæmia.
156	Stevens, E., Pt., E, 23d Mass., age 37.	Dec. 14, 14, '62.	Right. Died January 19, 1863, pyæmia
157	Stratton, A., Pt., D, 11th Maine, age 26.	Aug. 14, 14, '64.	Left. Died Aug. 15, 1864, hæmorrhage.
158	Strickland, J., Pt., I, 116th Illinois, age 27.	Sept. 1, 1, '64.	Right; circular; by A. S. Surg. C. B. Richards. Died Jan. 10, 1865, pneumonia.
159	Sullivan, J. C., Corp'l, F, 90th Illinois.	Sept. 1, 1, '64.	Right; by Surg. W. Lomax, 12th Ind. Died September 19, 1864.
160	Sweeny, J., Color Serg't, 30th Ohio.	June 27, 27, '64.	Left; by A. Surg. C. B. Richards, 30th Ohio. Died July 7, 1864.
161	Taylor, T. B., Pt., B, 38th Kentucky.	Sept. 18, 19, '62.	Left. Died September 29, 1862, pyæmia.
162	Taylor, T. H., Pt., G, 118th N. Y., age 16.	Aug. 9, 9, '64.	Flap. Died September 13, 1864, pyæmia.
163	Thomas, W. S., Pt., K, 14th Ind., age 17.	May 11, 12, '64.	Right; oval flap. Died June 3, 1864, pleuro-pneumonia.
164	Thomen, M. K., Serg't, D, 90th Ohio, age 32.	Dec. 16, 16, '64.	Right; antero-posterior flap. Died Dec. 31, 1864, erysipelas.
165	Thompson, S. C., Pt., D, 1st Conn. H. Art., age 18.	June 27, 27, '64.	Right; circular. Died Aug. 23, 1864, debility.
166	Trate, N., Pt., I, 188th Pennsylvania, age 22.	June 2, 3, '64.	Right; circular. Died Aug. 26, 1864, chronic diarrhœa.
167	Tripp, W. H., Pt., C, 8th Iowa, age 20.	Aug. 21, 21, '64.	Left; circular; by Asst. Surg. E. C. Strode, U. S. A. Died Sept. 4, 1864.
168	Van Alstine, J., Pt., I, 140th New York.	Feb. 6, 6, '65.	Right; by Surg. A. A. White, 8th Md. Died March 13, 1865.
169	Vandenbrugh, H. L., H, 1st New York Cav.	May 15, 15, '64.	Left. Died Sept. 28, 1864.
170	Vanswalenburg, G. P., Pt., K, 2d Michigan.	June 3, 3, '64.	Right; by Surg. S. S. French, 20th Mich. Died June 12, 1864.
171	Varnam, B., Pt., E, 142d New York, age 22.	Oct. 27, 27, '64.	Right; by Surg. G. C. Jarvis, 7th Conn. Died Nov. 20, 1864, exhaustion.
172	Walker, P., Pt., I, 104th New York, age 40.	June 18, 18, '64.	Right; muscular flaps; (also amp. left forearm.) Died July 9, 1864, exhaustion.
173	Welsh, E., Pt., C, 90th Illinois.	Aug. 3, 3, '64.	Right; flap; by Surg. R. Morris, 103d Illinois. Died August 11, 1864.
174	Westcott, D. L., Pt., C, 124th New York.	May 3, 3, '63.	Left; (also wound of left side.) Died May 24, 1863.
175	White, A., Pt., F, 140th Pa., age 23.	May 10, 10, '64.	Left; circular; by Surg. J. W. Wishart, 140th Pa. Died June 13, 1864, pyæmia.
176	White, G. A., Pt., H, 2d Vermont.	May 5, 5, '64.	Right. Died May 28, 1864.
177	Whitton, D. T., Pt., C, 5th Maine, age 24.	May 10, 10, '64.	Right; antero-posterior flap. Died June 14, 1864, exhaustion.
178	Wise, M., Pt., K, 9th Mich., age 37.	Nov. 10, 12, '64.	Right; circular; by Surg. J. H. Phillips, U. S. V. Died Dec. 6, 1864, pyæmia.
179	Wixon, D., Pt., 1st Mich. L. Art., age 29.	June 16, 16, '64.	Left; flap; erysipelas; gangrene. Died Aug. 11, 1864, exhaustion.
180	*Woodward, J. D.*, Pt., C, 48th Mississippi.	May 13, 13, '64.	Right; (also wound of both legs.) Died May 13, 1864.
181	Wolf, W., Pt., B, 13th Ohio Cav., age 25.	July 27, 28, '64.	Left; flap. Died Aug. 14, 1864, gangrene.
182	Yoricks, D., Corp'l, F, 3d New Jersey, age 29.	May 8, 9, '64.	Left; circular. Died June 2, 1864, exhaustion.
183	Zurphes, S., Pt., I, 51st Indiana, age 30.	Dec. 16, 16, '64.	Left; circular. Died Jan. 1, 1865.

2. Primary Amputations in the Middle Third of the Arm.—There were eleven hundred and sixty-two of these operations. The results as to fatality having been ascertained in all of them, give a mortality rate of 12.3 per cent., or slightly less than in the amputations in the upper third.

§ *Successful Cases.*—Of amputations in the middle third of the arm for shot injuries involving the lower part of the humerus or the elbow joint, a thousand and nineteen had favorable results.

FIG. 520.—Shot perforation of lowest third of the right humerus. *Spec.* 4109.

CASE 1656.—Private J. W. McLeod, 3d Maine Battery, aged 23 years, was wounded before Petersburg, September 11, 1864, by a minié ball, which produced compound fracture of the right elbow joint. He was received into the field hospital, 3d division, Second Corps, where the arm was amputated by Surgeon J. S. Jamison, 86th New York. The specimen (FIG. 520) was contributed to the Museum by the operator, and consists of the lowest third of the humerus. The bullet perforated the bone from the front, just above the condyles, producing two complete fractures downward through the trochlea, besides several in other directions, and much loss of substance from the posterior part of the bone. The wounded man was transferred to the Depot Hospital at City Point, and thence, on October 1st, to hospital at Alexandria. Surgeon E. Bentley, U. S. V., reported: "Antero-posterior flap amputation of right arm at middle third, performed on the field. Tonics and stimulants freely administered. Progress favorable." The patient was discharged from service on May 12, 1865, and pensioned. In his application for commutation, 1870, he stated that the stump was in a "healthy condition." The pensioner died on October 13, 1872. The immediate cause of his death has not been ascertained.

TABLE LXX.

Condensed Summary of One Thousand and Nineteen Cases of Recovery after Primary Amputation in the Middle Third of the Shaft of the Humerus.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Abbe, A. W., Pt., K, 9th Iowa.	May 22, 22, '63.	Right; flap; by Surg. E. J. McGoorisk, 9th Iowa. Disch'd July 16, 1863; pensioned.
2	Abbott, L., Serg't, B, 73d Ohio, age 33.	July 20, 21, '64.	Left; flap; by Surg. J. W. Hastings, 33d Mass.; necrosis; removal of bone June 27, 1865. Discharged Nov. 16, 1865; pens'd.
3	Abrams, J. S., Corp'l, B, 10th N. Jersey, age 22.	Oct. 19, 19, '64.	Left; flap; by Surg. O. R. Freeman, 10th N. J. Disch'd June 28, 1865; pensioned.
4	Ackermicht, J. F., Pt., I, 99th Pa., age 26.	May 15, 16, '64.	Right; flap. Disch'd Dec. 4, 1864.
5	Adams, C. O., Pt., G, 57th Mass., age 18.	May 6, 8, '64.	Right; flap; by Surg. D. W. Maull, 1st Del. Disch'd Jan. 14, 1865; pensioned.
6	*Adams, G. G.*, Pt., H, 10th Georgia, age 17.	Sept. 17, 17, '62.	Left; flap. Paroled Oct. 16, 1862.
7	Adlington, J. S., Pt., I, 12th Mass.	Sept. 17, 17, '62.	Left; circular; by Asst. Surg. J. T. Duffield, 7th Ind. Disch'd Nov. 11, 1862; pensioned.
8	Albee, H., Pt., A, 34th Mass., age 31.	Mar. 31, 31, '65.	Right; circular; by A. Surg. J. J. Allen, 34th Mass. Disch'd July 18, 1865; pensioned.
9	Alfred, S., Serg't, E, 68th Ind., age 45.	Aug. 15, 15, '64.	Right; circular; by Surg. C. Spinzig, 2d Mo. Disch'd Jan. 26, 1865; pensioned.
10	Allen, D., Pt., A, 1st Cavalry.	June 28, 30, '62.	Right; by Surg. Young, P.A.C.S. Disch'd Oct. 26, 1862; pensioned.
11	Allen, M. V., Pt., C, 6th Iowa.	Nov. 25, 27, '63.	Left; by Surg. W. S. Lombard, 6th Iowa. Disc'd Jan. 28, 1864; pensioned.
12	Allen, W., Pt., F, 116th Ohio, age 25.	June 18, 18, '64.	Right; flap; by Surg. T. J. Shannon, 116th Ohio. Disch'd Feb. 14, 1865; pensioned.
13	Allison, J. M., Corp'l, I, 111th Illinois.	May 14, 14, '64.	Right; by Surg. J. N. Barnes, 116th Ill. Disch'd June 7, 1865; pensioned.
14	Amonett, J. P., Pt., H, 50th Illinois, age 19.	April 6, 6, '62.	Right. Discharged Sept. 22, 1862; pensioned.
15	Andrews, J., Pt., K, 42d Ohio.	May 1, 1, '63.	Right; circular; by Surg. J. Pomcrene, 42d Ohio. Disch'd July 23, 1863; pensioned.
16	Annis, D. M., Pt., F, 11th N. H., age 37.	May 16, 16, '64.	Left; circ.; by Surg. W. B. Fox, 8th Mich. Disch'd; pensioned.
17	Anthony, E., Pt., D, 1st Conn. H. Art., age 27.	April 2, 3, '65.	Right; flap. Discharged June 24, 1865.
18	*Archer, C.*, Corp'l, H, 7th N. C., age 24.	June 22, 22, '64.	Left; flap.
19	Arnold, E. C., Pt., H, 15th Massachusetts.	Oct. 21, 22, '61.	Right; flap; by Surg. J. N. Bates, 15th Mass. Discharged April 14, 1862; pensioned.
20	Arnold, J., Pt., C, 41st New York.	Feb. 9, 9, '64.	Right. Discharged; pensioned.
21	Aston, J. D., Pt., C, 23d Ohio.	June 18, 19, '64.	Left; flap; by Surg. McKee. Discharged Dec. 12, '64; pensioned.
22	Atwater, S. C., Pt., I, 40th Ohio, age 23.	Dec. 15, 15, '64.	Left; circular; Discharged March 15, 1865.
23	Aubrey, H. C., Serg't, I, 145th Pa., age 22.	June 3, 3, '64.	Right; by Surg. G. L. Potter, 145th Pa. Discharged Sept. 13, 1864; pensioned.
24	*Austin, W. G.*, Pt., K, 4th N. C., age 20.	Oct. 28, 28, '64.	Right; circular. Furloughed Dec. 15, 1864.
25	*Averitt, W. H.*, Pt., K, 5th Florida, age 21.	July 3, 3, '63.	Left. Disch'd Nov. 17, 1863.
26	Avery, J. A., Serg't, K, 37th Wis., age 32.	June 18, 18, '64.	Left. Furloughed Oct. 31, 1864.
27	Avery, L. K., Pt., C, 6th Pa. Reserves.	Sept. 14, 16, '62.	Left; flap. Discharged Feb. 3, 1863; pensioned.
28	Ayres, A. M., Pt., C, 132d Pa., age 21.	Sept. 17, 17, '62.	Left. Disch'd; pensioned.
29	Badger, W., Pt., I, 6th Col'd Troops, age 47.	Sept. 29, 29, '64.	Left. Discharged April 14, 1865; pensioned.
30	Bailey, J. E., Corp'l, D, 11th Maine, age 30.	June 2, 2, '64.	Left; by Surg. N. F. Blunt, 11th Me. Disch'd; pensioned.
31	Baker, T. R., Corp'l, K, 2d Ohio Cav.	May 31, June 1, 1864.	Left. Disch'd Jan. 26, 1865; gangrene; pensioned.
32	Balcolm, E. H., Pt., E, 61st N. Y., age 39.	May 12, 12, '64.	Right; by Surg. J. W. Wishart, 140th Pa. Furloughed.
33	Banghart, L., Pt., G, 52d Ohio, age 24.	July 9, 9, '64.	Right; circular; by Surg. H. M. Duff, 52d Ohio. Disch'd Feb., 1865; pensioned.
34	Barber, D., Pt., I, 33d New York.	May 4, 4, '63.	Left; by Surg. J. Hausen, 20th N. Y. Disch'd; pensioned.
35	*Barber, R. J.*, Serg't, D, 43d Ala., age 26.	Mar. 25, 25, '65.	Right. Transferred to prison May 10, 1865.
36	Barber, R. M., Pt., B, 148th N. Y., age 17.	June 15, 15, '64.	Right; flap. V. R. C. April 8, 1865; pensioned.
37	Baringer, J. H., Pt., D, 100th Ohio, age 22.	Aug. 5, 6, '64.	Right; circular; by Surg. J. H. Rodgers, 104th Ohio. Disch'd May 18, 1865; pensioned.
38	Barlow, A., Pt., C, 14th Michigan, age 21.	Sept. 1, 2, '64.	Right; flap; by Surg. E. Batwell, 14th Mich. Discharged June 22, 1865; pensioned.
39	Barlow, I. H., Pt., B, 6th N. Y. Cav., age 39.	Sept. 4, 4, '64.	Left; flap. Discharged Jan. 23, 1865; pensioned.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
40	Barner, J., Pt., B, 91st New York.	Dec. 13, 13, '62.	Right. Disch'd April 24, 1863; pensioned.
41	Barnes, J. A., Pt., C, 60th Ohio, age 40.	Sept. 30, Oct. 1, 1864.	Right; circular; by Surg. W. C. Shurlock, 51st Pa. Discharged May 13, 1865; pensioned.
42	Barrett, W., Pt., A, 104th Illinois, age 22.	May 16, 17, '64.	Right; circ.; by Surg. J. S. Gregg, 88th Ind.; gangrene. Discharged Feb. 27, 1865; pensioned.
43	Barrow, J., Pt., A, 4th Ohio, age 39.	Aug. 25, 27, '64.	Left; double flap. Discharged April 9, 1865; pensioned.
44	B——, P., Pt., D, 39th Massachusetts.	July 7, 8, '64.	Right; flap; by Surg. E. G. Chase, 104th N. Y. Discharged Oct. 28, 1864; pensioned. *Spec.* 4127.
45	Bartlett, L., Pt., H, 93d New York, age 25.	Aug. 15, 15, '64.	Left; flap; by Surg. H. F. Lyster, 5th Mich. Disch'd Jan. 8, 1865; pensioned.
46	Bastin, T., Pt., B, 21st Kentucky, age 47.	Sept. 2, 3, '64.	Left; flap; by Asst. Surg. W. H. Matchett, 40th Ohio; gangrene. Disch'd Mar. 22,'65; pensioned.
47	Beachy, J. F., Pt., H, 39th Ill., age 22.	June 2, 2, '64.	Left; necrosis. Jan. 17, 1865, amp. at shoulder joint. Discharged March 15, 1865; pensioned.

942	Warner, H., Pt., B, 51st Pennsylvania, age 37.	June 3, 3, '64.	Left; circ.; by Surg. W. B. Fox, 8th Mich. Disch'd Mar. 15, '65. pensioned.
943	Warner, H. E., Pt., E, 22d Wisconsin, age 25.	May 15, 15, '64.	Left; flap; by Surg. T. Natchard, 22d Wis. Discharged March 7, 1865; pensioned.
944	Warner, J. B., Corp'l, G, 124th Indiana, age 19.	Mar. 10, 10, '65.	Left; flap. Disch'd May 29, '65; pensioned.
945	Washburn, A., Pt., H, 19th Maine, age 23.	July 2, 3, '63.	Right; flap; by Surg. S. H. Plumb, 82d N. Y. Discharged Oct. 23, 1863; pensioned.
946	Wasser, L., Pt., A, 44th Illinois, age 19.	Dec. 16, 17, '64.	Right; flap; by Surg. H. E. Hasse, 24th Wis. Disch'd Sept. 15, '65.
947	Wasson, A. J., Pt., H, 134th New York.	July 1, 2, '63.	Right; circular. Disch'd May 9, 1864.
948	Watson, C. C., Corp'l, D, 3d Iowa, age 18.	Oct. 5, 5, '62.	Right; by Surg. B. F. Keubles, 3d Ia. Disc'd Nov. 18, '62; pens'd.
949	Watson, T. J., Serg't, I, 20th Ohio, age 23.	July 21, 22, '64.	Right; circular; by Surg. Dance, 8th Tenn., C. S. A. Discharged July 21, 1865; pensioned.
950	Webb, G. A., Pt., C, 5th Michigan.	Dec. 13, 15, '62.	Left; flap. Discharged March 18, 1863; pensioned.
951	Weber, H., Pt., E, 31st New York.	May 7, 7, '62.	Right. Discharged July 21, 1862; pensioned.
952	Webster, G. W., Pt., K, 44th New York.	Aug. 30, 30, '62.	Left; by Surg. W. Frothingham, 44th N. Y. Disch'd Oct. 10, 1862; pensioned.
953	Weed, A. L., Pt., B, 16th Illinois, age 24.	Mar. 20, 20, '65.	Left; flap; by Surg. H. R. Payne, 10th Ill. Disch'd June 25, 1865; pensioned.
954	Weeks, J. T., Pt., G, 3d Colored Troops, age 20.	Nov. 14, 14, '63.	Left; antero-posterior flap; by Surg. S. W. Gross, U. S. V. (Also amp. of thigh.) Disch'd July 26, 1865; pensioned.
955	Weisheit, L., Pt., I, 87th Pennsylvania.	June 13, 13, '63.	Left. Discharged Feb. 15, 1864; pensioned.
956	Weiss, C., Servant to General Howard.	July 3, 3, '63.	Left; circular. Discharged Oct. 30, 1863.
957	Welch, E. F., Pt., E, 57th New York, age 20.	June 16, 17, '64.	Left; flap; by Surg. W. W. Potter, 57th N. Y. Disch'd Sept. 9, '64; pensioned.
958	Welding, L. H., Pt., I, 7th Wisconsin, age 21.	Aug. 28, 28, '62.	Right; circular. Disch'd Oct. 10, 1862.
959	Wells, H. E., Pt., H, 19th Illinois.	Dec. 29, 29, '62.	Left; flap; by Surg. R. G. Pogue, 19th Ill. Disch'd Feb. 9, 1863; pensioned.
960	*Wells, W. B.*, Pt., L, 67th N. C., age 19.	Mar. 8, 9, '65.	Right; circular. Duty May 1, 1865.
961	Welsh, T., Pt., L, 102d Pennsylvania, age 26.	June 18, 19, '64.	Right; circular; by Surg. M. J. Morrison, 102d Pa. Disch'd Feb. 10, 1865; pensioned.
962	*Wempter, A. F.*, Corp'l, F, 50th Virginia.	July 1, 1, '63.	Left; flap. Paroled Sept. 5, 1863.
963	Wescott, D. C., Pt., B, 111th N. Y., age 21.	Mar. 31, 31, '65.	Right; flap; by A. Surg. W. Aiken, 121st N. Y. Disch'd July 27, 1865; pensioned.
964	West, M. C., Pt., H, 2d Maine Cav., age 46.	July 18, 18, '64.	Left; by Surg. G. W. Martin, 2d Me. Cav. Disch'd Aug. 17, 1864; pensioned.
965	West, J., Pt., F, 31st Ill., age 33.	July 21, 23, '64.	Left; circular. Duty Dec. 7, 1864; pensioned.
966	Wessells, H., Pt., D, 16th Connecticut.	Sept. 17, 18, '62.	Right; by Surg. Brown, 12th S. C. Disch'd Jan. 8, 1863; pensioned.
967	Wetzlan, G., Lt., H, 17th Missouri.	Sept. 1, 1, '64.	Right; by Surg. A. Savine, 76th Ohio. Disch'd; pensioned.
968	Wheeler, W., Pt., B, 100th New York.	Aug. 27, 27, '63.	Left; flap. Discharged Nov. 16, 1863.
969	*Wheeless, A. W.*, Pt., I, 43d N. C., age 29.	Mar. 25, 26, '65.	Right; circular; by A. Surg. E. R. Roche, 35th Mass. Released June 14, 1865.
970	White, F. F., Pt., B, 11th Maine, age 20.	Mar. 30, 30, '65.	Right; circular; by Surg. C. M. Clark, 39th Ill. Disch'd July 20, 1865; pensioned.
971	White, F. L., Pt., K, 107th New York, age 31.	May 25, 27, '64.	Left; flap. Disch'd Feb. 7, 1865; pensioned.
972	White, J., Serg't, G, 42d Illinois, age 21.	May 14, 15, '64.	Left; flap. Disch'd Feb. 4, 1865; pensioned.
973	White, J. W., Pt., A, 14th Penn. Cav., age 19.	Dec. 4, 5, '64.	Left; flap; by Surg. W. A. Barry, 98th Pa. Disch'd Feb. 25, 1865; pensioned.
974	Whittemore, E. F., Corp'l, H, 32d Mass., age 22.	May 12, 12, '64.	Right; circular. Disch'd June 3, 1865.
975	Wickware, C., Corp'l, I, 6th Vermont, age 23.	May 5, 6, '64.	Left; flap; by Surg. E. Phillips, 6th Vt. Disch'd Aug. 11, 1864; pensioned.
976	Widell, W., Pt., K, 5th Penn. Cav., age 35.	Oct. 7, 7, '64.	Right; flap. Discharged May 15, 1865; pensioned.
977	Wiestenberg, F., Pt., A, 2d Michigan.	July 21, 21, '61.	Left; circular; by Surg. H. F. Lyster, 5th Mich. Disch'd Aug. 23, 1861; pensioned.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
978	Wilbur, T. T., Pt., H, 40th Mass., age 19.	June 24, 24, '64.	Left; circular. Disch'd June 23, 1865.
979	Wilcher, J. F., Pt., I, 10th Kentucky.	Sept. 1, 1, '64.	Left; flap; by Surg. C. H. Fowler, 105th Ohio. Disch'd Dec. 6, 1864.
980	*Wilcox, J. P.*, Pt., A, 49th Tennessee, age 19.	Nov. 30, Dec. 1, 1864.	Left; ant.-post. flap; by Surg. Jackson, C. S. A. Duty Jan. 23, '65.

994	Wilson, W., Pt., A, 13th Ohio.	Dec. 31, 31, '62.	Right. Disch'd August 26, 1863; pensioned.
995	Wilton, G. F., Pt., G, 12th Mass., age 30.	May 5, 6, '64.	Right; circular; by Surg. W. H. W. Hinds, 12th Mass. Disch'd August 20, 1864; pensioned.
996	Wilton, W. F., Pt., K, 30th Illinois.	May 16, 18, '63.	Right; by A. Surg. W. Feland, 30th Illinois. Discharged Aug. 19, 1863; pensioned.
997	Windsor, T. A., Pt., E, 40th Indiana, aged 22.	Dec. 16, 16, '64.	Right; flap; by Asst. Surg. J. C. Thorpe, U. S. V. Discharged July 22, 1865; pensioned.
998	Wingert, J., Pt., F, 143d New York, age 26.	July 20, 20, '64.	Left; flap. Discharged June 1, 1865; pensioned.
999	Winkler, A., Pt., C, 1st Maryland Cav., age 22.	Oct. 13, 13, '64.	Right; circular. Disch'd July 6, 1865; pensioned.
1000	Winn, J. J., Q. M., U. S. Navy, Steamer Oneida.	April 22, 22, '62.	Left; by Surg. J. Y. Taylor, U. S. N. Pensioned.
1001	Winn, W., Pt., F, 95th New York, age 40.	June 24, 24, '64.	Left; ant.-post. flap. Discharged May 31, 1865; pensioned.
1002	Winslow, I. B., Serg't, A, 6th Conn., age 31.	Aug. 16, 16, '64.	Right. Discharged Nov. 15, 1864.
1003	Wise, A. J., Pt., A, 46th Penn.	May 25, 26, '62.	Left; by Brig. Surg. T. Antisell. Discharged; pensioned.
1004	*Witherton, J. C.*, Pt., Ala. Battalion, age 23.	May 16, 16, '64.	Left; circular. Furloughed June 9, 1864.
1005	Wanderby, G. W., Pt., B, 97th Pennsylvania.	June 10, 10, '62.	Left; by Surg. J. R. Everhart, 97th Pa. Disch'd July 31, 1862; pensioned.
1006	Wood, C., Pt., G, 10th Connecticut, age 20.	Oct. 7, 7, '64.	Left; flap. Disch'd Mar. 18, 1865; pensioned.
1007	Wood, S., Pt., C, 33d Ohio, age 23.	Aug. 9, 9, '64.	Left; flap. Duty Jan. 17, 1865; pensioned.
1008	Wood, W. H., Corp'l, I. 1st Ohio Light Artillery.	May 2, 4, '63.	Right. Disch'd Dec. 11, 1863; pensioned.
1009	Woodbury, U. A., Serg't, H, 2d Vermont.	July 21, 21, '61.	Right; by Surg. N. H. Ballou, 2d Vt. Disch'd; pensioned.
1010	Woodhouse, F., Pt., K, 59th N. Y., age 42.	July 3, 4, '63.	Right; by A. A. Surg. M. A. Hanly. Discharged October 12, 1863.
1011	Woodward, J., Pt., C, 93d Ohio, age 30.	June 23, 24, '64.	Left; flap; by Asst. Surg. A. M. Morrison, 23d Ky. Disch'd Dec. 2, 1864; pensioned.
1012	Worden, C. H., Corp'l, B, 2d Ohio Cav., age 24.	May 9, 9, '64.	Left; circ.; by Surg. J. T. Smith, 2d Ohio Cav. Disch'd Mar. 20, 1865; pensioned.
1013	*World, J.*, Pt., D, 44th Virginia, age 20.	April 6, 6, '65.	Left; ant.-post flap. Released July 5, 1865.
1014	Worley, D. T., Pt., D, 8th Ind. Cav., age 23.	Mar. 16, 16, '65.	Left; ant.-post. flap; by A. Surg. M. C. Connett, 8th Ind. Cav. Disch'd Sept. 1, 1865; pens'd.
1015	Wright, J. H., Pt., H, 29th Ohio, age 35.	May 8, 9, '64.	Right; by Surg. A. K. Fifield, 29th Ohio. Disch'd; pensioned.
1016	Wright, J. E. P., Pt., G, 2d Vermont, age 27.	May 12, 12, '64.	Left; circular; by Surg. A. H. Chessmore, 5th Vt. Disch'd Aug. 22, 1864; pensioned.
1017	Wright, M., Pt., I, 31st Colored Troops.	July 30, 31, '64.	Left; flap. Disch'd Jan. 12, 1865.
1018	Wright, S. A., Pt., F, 1st U. S. S. S., age 27.	May 5, 5, '64.	Left; flap; by Surg. H. F. Lyster, 5th Mich. Disch'd Sept. 12, '64; pensioned.
1019	Young, J. W., Pt., D, 30th Indiana, age 21.	June 19, 19, '64.	Left; flap; by Surg. S. H. Kersey, 30th Ind. Disch'd Mar. 3, 1865; pensioned.

The foregoing series of a thousand and nineteen successful primary amputations at the middle of the arm were practised on a thousand and eighteen patients, of whom seventy-six were Confederates. The wounds were inflicted by solid cannon shot in fourteen cases; by shell fragments, in seventy-nine; by grape or canister, in twelve; by premature explosion of cannon, in twelve; by small projectiles, in nine hundred and one cases. Twenty-eight patients were seriously wounded in other regions. In one case, an excision of the upper extremity of the radius was essayed, but abandoned for amputation. Three amputations of the thigh,[1] one of the leg, one of the opposite arm, one of the forearm, and two of the fingers of the opposite hand, were operations practised simultaneously with the arm amputations. Subsequently there were practised: re-amputations in the upper third, in nine instances; exarticulation at the shoulder, in three cases; secondary amputation of the opposite arm, in one case; three operations of neurotomy; a ligation of the axillary, and two of the brachial artery.[2] Sixty-six of the patients returned to modified duty, eight hundred and eighty-nine were discharged for disability, forty-seven were exchanged or paroled, eight were furloughed from Confederate hospitals; the final disposition of eight

[1] Surgeon S. W. Gross, U. S. V. (*Cases of Synchronous Amputation of the Left Thigh at its Upper Third, and of the left Arm*, in *Am. Med. Times*, 1864, Vol. VIII, p. 122) gives a detailed account of one of these double amputations (Case of Weeks, No. 954).

[2] Dr. G. J. Fisher (*Report of Fifty-seven Cases of Amputations in the Hospitals near Sharpsburg, after the Battle of Antietam*, in *Am. Jour. Med. Sci.*, 1863, Vol. XLV, p. 49. See Cases 6 and 301); Surgeon James Bryan, U. S. V. (*Seventeen Amputations from the Armies of the Southwest*, in *Am. Med. Times*, 1863, Vol. VII, p. 287. See Case 135); Medical Cadet D. C. Lloyd, U. S. A. (*Report of Cases of Hospital Gangrene, at Memphis*, in *Am. Med. Times*, 1863, Vol. VII, p. 267. See Case 153); and Surgeon J. H. Thompson, U. S. V. (*Report of the Wounded at the Battle of New Berne*, in *Am. Med. Times*, 1862, Vol. V, p. 7. Case 335), have published observations on successful amputations of the arm at the middle third for shot injury.

PLATE XXII. 1. OSTEOMYELITIS OF HUMERUS. 2. LIGATION OF POPLITEAL

TABLE LXXI.

Condensed Summary of One Hundred and Forty-three Unsuccessful Cases of Primary Amputation in the Middle Third of the Shaft of the Humerus.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Allen, C. W., Pt., C, 1st Maine H. A., age 23.	June 18, 18, '64.	Left; double flap; by Surg. J. S. Jamison, 86th N. Y. Died July 22, '64, pyæmia. *Specs.* 2886, 3134.
2	Allen, F. A., Corp'l, G, 20th Massachusetts.	Sept. 17, 17, '62.	Right; re-amp. at shoulder joint Oct. 12. Died Oct. 25, 1862, pyæmia. *Spec.* 267.
3	Armitinger, C., Pt., K, 30th Wisconsin.	June 3, 3, '64.	Right; circ.; by Surg. C. Miller, 30th Wis. Died June 22, 1864, pyæmia.
4	Atkinson, M., 1st Serg't, G, 1st N. J., age 27.	May 3, 3, '63.	Right; flap. Died May 25, 1863, pyæmia.
5	Baldwin, G. E., Pt., B, 14th N. Y. S. M., age 22.	May 8, 10, '64.	Right; circular; by A. Surg. J. T. Duffield, 7th Ind. Died June 13, 1864, typhoid fever.
6	Barnett, W. H., Pt., B, 15th New Jersey.	June 1, 3, '64.	Right; flap; by A. Surg. G. R. Sullivan, 15th N. J. Died July 15, 1864, pyæmia.
7	Barr, S. A., Pt., I, 110th Ohio, age 20.	July 9, 9, '64.	Right; circular. Died Aug. 12, 1864, pyæmia.
8	*Barrow, W. H.*, Pt., A, 66th N. C., age 18.	Mar. 10, 10, '65.	Left; circular; by A. Surg. R. G. Harrison, 120th Ind. Died April 3, 1865, typhoid fever.
9	Bartholomew, N. G., Capt., E, 76th New York.	May 5, 5, '64.	Right. Died May 5, 1864.
10	Baryan, L., Pt., A, 75th New York.	Sept. 19, 19, '64.	Left. Died Sept. 19, 1864.
11	Bell, E., Pt., G, 62d Ohio, age 30.	April 9, 9, '65.	Right; by Surg. C. M. Clark, 39th Ill. Died May 31, 1865, phthisis pulmonalis.
12	Berry, C., Pt., E, 70th Indiana.	June 16, 16, '64.	Left. Died June 30, 1864.
13	*Black, J. W.*, Pt., I, 40th Tennessee, age 21.	Dec. 15, 15, '64.	Left. Died December 22, 1864.
14	Bowker, J., Adj't, 179th New York, age 24.	Sept. 30, 30, '64.	Left; flap; by Surg. T. M. Flandrau. 146th N. Y. Died Oct. 26, 1864.
15	Brannan, I. M., Corp'l, B, 95th Pa.	Dec. 12, 12, '62.	Died December 14, 1862.
16	Brigham, J. S., Pt., K, 17th Maine, age 19.	June 1, 1, '64.	Right; ant.-post. flap. Died July 25, 1864, exhaustion.
17	Burton, L., Pt., B, 43d Colored Troops.	July 17, 17, '64.	Left; circ.; by Surg. J. P. Prince, 36th Mass. Died Aug. 5, 1864.
18	Butler, F., Pt., F, 8th Maine, age 25.	June 7, 7, '64.	Left; lateral flap. Died July 5, 1864.
19	Cahoon, S., Pt., A, 58th Mass., age 22.	May 6, 6, '64.	Right. Died July 25, 1864.
20	Calvin, W. H., Pt., D, 91st Indiana, age 25.	Nov. 30, Dec. 1, 1864.	Left; ant.-post. flaps; by A. Surg. J. Tolerton, 129th Ind. Died Feb. 13, 1865, chronic diarrhœa.
21	Canfield, J., Pt., I, 5th Michigan, age 20.	May 6, 6, '64.	Right; flap; by Surg. H. F. Lyster, 5th Mich. Died June 9, '64, typhoid fever.
22	Carlow, W. H., Pt., G, 121st N. Y., age 23.	Oct. 19, 19, '64.	Right. Died November 8, 1864; pyæmia.
23	Carpenter, O. F., Pt., B, 25th Mass., age 20.	June 3. 5, '64.	Right; circular. Died June 16, 1864, pyæmia.
24	Carroll, M., Corp., K, 81st Pennsylvania, age 22.	June 4, 4, '64.	Right; ant.-post. flaps; by Surg. J. W. Wishart, 140th Pa.; (also exc. head left humerus.) Died June 14, 1864, exhaustion.
25	Chapman, O. C., Pt., E, 2d Michigan, age 47.	June 17, 17, '64.	Left; circular. Died July 22, '64.
26	Clark, C. T., Pt., I, 111th Illinois, age 49.	Aug. 31, 31, '64.	Right; flap; by Surg. I. N. Barnes, 116 Ill. Died March 26, 1865, pneumonia.
27	Clark, J., Pt., B, 99th Pennsylvania.	Dec. 13, 13, '62.	Right. Died January 14, 1863.
28	Clark, J., Corp., K, 14th N. Y. H'y Art., age 17.	May 8, 8, '64.	Left; double flap. Died June 1, 1864, typhoid fever.
29	Clark, R., Pt., D, 13th Colored Troops, age 18.	Dec. 16, 16, '64.	Left; flap; by A. A. Surg. I. S. Giltner; (amp. right arm, upper third.) Died Dec. 19, 1864.
30	Clarke, O. G., Pt., B, 10th Vermont, age 20.	May 12, 12, '64.	Right; circular. Died July 28, 1864.
31	*Cline, E.*, Pt., E, 12th N. Carolina.	Sept. 19, 19, '64.	Circular; by Surg. G. L. Miller, C. S. A. Died Oct. 14, '64, pyæmia.
32	*Coachman, E. F.*, Serg't, A, Hampton Legion.	May 31, June 1, 1862.	Flap; by Surg. G. Grant, U. S. V. Died August 6, 1862.
33	Cochran, R. A., Corp., F, 102d Pa., age 28.	May 15, 15, '64.	Left; flap. Died May 27, 1864, anæmia.
34	*Cock, A.*, Pt., H, 42d Tennessee, age 30.	Dec. 16, 18, '64.	Right; circular. Died January 7, 1865.
35	Coffett, A. C., Pt., C, 71st Ohio, age 32.	Dec. 17, 17, '64.	Right; circular; by A. A. Surg. R. McNeilly. Died Dec. 31, '64.
36	Colby, G. H., Corp., D, 1st N. H. Cav.	April 9, 10, '64.	Right; circular. Died April 30, 1864.
37	Cole, R., Pt., H, 40th Ohio.	June 1, 1, '64.	Left; by Surg. S. H. Kersey, 36th Indiana. Died June 30, 1864.
38	Collins, D. F., Pt., G, 155th N. Y., age 20.	June 3, 3, '64.	Left. Died July 7, 1864, typhoid fever.
39	Collins, W., Capt., G, 5th N. Hampshire, age 35.	April 5, 5, '65.	Right; flap. Died April 29, 1865, pyæmia.

124	Storers, J., Pt., H, 203d Pennsylvania, age 23.	Jan. 15, 16, '65.	Left; circ.; by A. Surg. F. B. Kimball, 3d N. H. Died Feb. 22, 1865, exhaustion.
125	Sullivan, B., Pt., I, 3d Missouri.	July 28, 28, '64.	Left; by Surg. A. Sabine, 76th Ohio. Died Aug. 26, 1864.
126	Sweitzer, S., Pt., B, 3d Kentucky, age 25.	June 1, 1, '64.	Right; flap; by Surg. J. B. Burns, 3d Ky. Died June 23, 1864, pyæmia.
127	Taylor, F., Pt., A, 1st N. C. A. (colored), age 27.	Mar. 12, 12, '65.	Right; circular. Died May 29, 1865, exhaustion.
128	*Temple, T. B.*, Pt., A, 8th N. C., age 29.	June 14, 14, '64.	Left; flap; erysipelas. Died July 31, 1864, exhaustion.
129	Troy, P., Corp'l, G, 2d Conn., age 26.	Sept. 19, 19, '64.	Right; circular; by Surg. W. A. Barry, 98th Pa. Died Oct. 19, 1864, secondary hæmorrhage.
130	Wachter, J., Pt., E, 52d New York.	June 2, 4, '62.	Left; circular. Died June 10, 1862, gangrene.
131	Wagner, O., 1st Lieut. Topographical Engineers.	April 17, 17, '62.	Left; circ.; by Surg. O. A. Judson, U. S. V. Died April 21, 1862.
132	Walbridge, D. S., Lt., A, 11th Vermont, age 31.	June 4, 4, '64.	Right; ant.-post. flap; by Surg. C. B. Parks, 11th Vt.; hæmorrhage. Died June 19, 1864, exhaustion.
133	Ward, E. E., Pt., F, 6th Mich. Cav., age 27.	April 1, 2, '65.	Left. Died April 27, 1865, pneumonia.
134	Wendorf, F., Pt., B, 26th Wisconsin, age 29.	June 22, 22, '64.	Left; ant.-post. flap. Died July 26, 1864, enteric fever.
135	Westfall, C. M., Pt., D, 24th Iowa.	Sept. 19, 20, '64.	Right; circular. Died October 14, 1864, gangrene.
136	Whitehead, H., Corp., I, 191st Penn., age 24.	Feb. 6, 6, '65.	Right; circular; by Surg. W. Lyons, 191st Penn. Died March 1, 1865, pyæmia.
137	Wilder, H., Pt., G, 117th Illinois, age 32.	Dec. 16, 16, '64.	Left; flap; by Surg. M. Wiley, 117th Ill. Died Jan. 15, 1865, typhoid fever.
138	Williams, A. H., Pt., D, 97th N. Y., age 17.	May 10, 10, '64.	Left; circular. Died May 23, 1864.
139	Williams, P., Pt., G, 113th Ohio, age 35.	June 27, 27, '64.	Right; circular; by Surg. S. H. Kersey, 36th Ind. Died Sept. 11, 1864, acute bronchitis.
140	Wills, J. H., Pt., H, 23d Col'd Troops, age 21.	July 30, 30, '64.	Right; flap; by Surg. G. J. Potts, 23d C. T. Died May 9, 1865, inflammation of pleura.
141	Woods, J. G., Pt., E, 59th Mass., age 45.	June 3, 3, '64.	Left. Died June 29, 1864, pyæmia.
142	Wolverton, J. D., Pt., D, 11th Ohio.	Nov. 10, 10, '61.	Right. Died December 25, 1861, pyæmia.
143	*Yeatman, R.*, Pt., D, 40th Virginia, age 25.	Aug. 27, 29, '64.	Right; circular; by Asst. Surg. W. F. Richardson, C. S. A. Died September 27, 1864.

The operations were practised on one hundred and thirty-two Union and eleven Confederate soldiers. Seventy amputations were on the right and sixty-four on the left side, this particular being unnoticed in the nine remaining instances. Fourteen of the patients had serious wounds in other regions, and seven underwent synchronous operations of magnitude—two having the opposite arm amputated, one the opposite shoulder excised, another losing a hand, another a leg, a sixth the greater part of the hand, and the seventh having splinters of the trochanter gouged away. There were two re-amputations, and other consecutive major operations were performed in several cases.

HOSPITAL GANGRENE OF AN ARM STUMP

3. Primary Amputations in the Lower Third of the Arm.—Contrary to the rule that has come to be regarded almost as axiomatic,—that the gravity of amputations of the extremities steadily augments in proportion as the incisions approach the trunk,—the mortality rate of amputations in the lower third greatly exceeded that of amputations in the middle and upper thirds. Although the number of operations was less than half as in either of the other regions, yet a series of five hundred and twelve cases would appear sufficient to afford a fair average of results. An analysis of the operations will suggest some explanation of this anomalous fact, even if failing fully to account for it.

§ *Successful Cases.*—Four hundred and six amputations in the lower third of the arm for the effects of shot injuries of the forearm or elbow joint had favorable results.

PLATE XV, opposite, is from a water-color drawing of a gangrenous stump of a paroled soldier, who had undergone primary amputation at the lower third of the arm. The drawing was prepared at Annapolis, by Mr. Stauch, in August, 1863.

CASE 1662.—Private Milton E. Wallen, aged 41 years, was enrolled at Albany, July 27, 1861, in Co. C, 1st Kentucky Cavalry. The muster-out roll of his regiment refers to his being captured near Lawrenceville, Georgia, in August, 1864, and released at Goldsboro', in February, 1865. There has been much discussion regarding the identification of this man with the paroled prisoner who answered to this name and military description. Surgeon B. A. Vanderkieft, U. S. V., reports that: "Private Milton Wallen, Co. A, 1st Kentucky Cavalry, was admitted to the general hospital August 3, 1863. He states that he was taken prisoner on Cumberland River, June 1, 1863, and while in prison at Richmond was shot by one of the guards with a minié ball, which entered the upper third of the right forearm posteriorly, fracturing the bones and implicating the elbow joint, and that amputation was performed, on the same day, above the elbow. When admitted the patient was feeble, but, on the whole, doing well. On August 20th, the stump commenced to take on unhealthy action, and by the 24th the entire stump was attacked by hospital gangrene, the flaps being rapidly disorganized and the bone protruding. The treatment was limited to the strictest attention to hygienic measures, with an allowance of an abundance of the invigorating salt air from the bay." At this period a sketch in color of the gangrenous stump (PLATE XV) was prepared by Hospital Steward Stauch, sent from Washington with that object. "For a few days afterward the stump was dressed with charcoal and yeast poultices, and a generous diet and an ample allowance of ale and other stimulants was allowed. By August 30, 1863, the sloughing process was entirely arrested, and from this date the patient steadily improved. In October he was furloughed from the hospital, and was reported as having deserted on furlough, April 5, 1864." In 1873, he made application for a pension, stating that "he was captured at Rowena, on the Cumberland River, May 26, 1863, and carried to Atlanta, Georgia, then from there to Richmond, and placed in Castle Thunder, and while there was shot by the guards, July 4, 1863." The affidavits of two former company comrades were filed, stating that they knew that this man was captured near Camp Nelson, on the Cumberland River, while attached to Colonel Haskins's command, at Albany, Kentucky.

CASE 1663.—Private C. Canty, 1st Massachusetts Heavy Artillery, aged 21 years, received a gunshot fracture of the left elbow before Petersburg, June 18, 1864. Amputation was performed at the hospital of the 3d division, Second Corps, by Surgeon G. M. Brennan, 1st United States Sharpshooters. June 29th, the patient reached the First Division Hospital, at Alexandria, whence Surgeon C. Page, U. S. A., reported: "Amputation of left arm at lower third; operation performed on the field, apparently by circular method. Doing well. Treatment: Tonics and stimulants." On November 28, 1864, the patient was discharged from service and pensioned. In his application for commutation, 1870, he described the stump as being "healthy but extremely tender." The pensioner was paid on June 4, 1875. The specimen (FIG. 523) was received from the Army of the Potomac, and consists of the "bones of the left elbow after primary amputation at the lowest third of the arm, showing the olecranon badly fractured, the outer condyle carried away, and the head of the radius chipped."—*Cat. Surg. Sect.*, 1866, p. 147.

FIG. 523.—Shot fracture of the left elbow *Spec.* 3023.

CASE 1664.—Corporal F. R. Leach, Co. D, 1st Maine Heavy Artillery, aged 23 years, received a shot fracture of the right elbow at Petersburg, September 9, 1864, for which amputation was performed by Surgeon J. S. Jamison, 86th New York, at the field station of the 3d division, Second Corps. The specimen (FIG. (524) was forwarded to the Museum by the operator, and consists of "the bones of the right elbow, amputated in the lower third of the humerus for a perforating fracture directly over the joint. The bullet entered from before, chipped the conoidal process of the ulna, carried away the central portion of the trochlea, shattered the olecranon, and caused a vertical fracture of the humerus, which terminated in a transverse one two inches above the condyle. The forearm was probably partly flexed at the time of the injury." (*Cat. Surg. Sect.*, 1866, p. 164.) Two days after the injury, the wounded man was transferred to the Second Corps depôt hospital at City Point, and, October 1st, he was admitted to the First Division Hospital, Alexandria. Surgeon E. Bentley, U. S. V., reported: "Amputation at lower third of right humerus by flap operation, performed at a field hospital. Chloroform used. Wound healing. Stump looks well. Patient furloughed on November 1st." He was discharged May 5, 1865, and pensioned. The pensioner was paid June 4, 1875.

FIG. 524.—Posterior view of a shot fracture of the right elbow. *Spec.* 4168.

In eight instances in this series, amputation was practised because of wounds inflicted by solid cannon shot, and in twenty-six instances, for comminutions by shell fragments; but fracture at or near the elbow by musket balls was the predominating form of injury:

FIG. 525.—Shot comminution of the articular extremities of the bones of right elbow. *Spec.* 3219.

CASE 1665.—Captain B. B. Brown, Co. I, 1st New Jersey, aged 37 years, was wounded at Spottsylvania, May 12, 1864, by a minié ball, which struck upon the internal portion of the right elbow joint, passing transversely through, fracturing and comminuting the superior two and a half inches of the ulna, grazing the articular surface of the radius, and comminuting the external trochlea of the humerus. The shot was received in the act of charging, from a distance of about fifty yards. Amputation was performed the same day, at the field hospital, 1st division, Sixth Corps, by Surgeon L. W. Oakley, 2d New Jersey, who contributed the specimen (FIG. 525), consisting of "the bones of the right elbow, amputated at the lowest third of the arm." The patient entered the Seminary Hospital, Georgetown, May 25th, where Surgeon H. W. Ducachet, U. S. V., recorded: "Circular amputation at lower third." The stump healed kindly, but about two months after the injury was received the Captain was accidentally thrown from a wagon, causing protrusion of the humerus through the integuments. After this, however, the stump again healed kindly. Captain Brown was mustered out of service on June 23, 1864, but was subsequently appointed an officer of the 10th regiment, Veteran Reserve Corps, and ultimately discharged on July 28, 1867, and pensioned. Examiner B. A. Watson, of Jersey City, November 9, 1867, certified: "Arm amputated at junction of upper third with middle. The stump is very sensitive, so much so that an artificial limb cannot be worn." The pensioner was paid June 4, 1875.

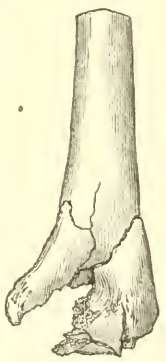

FIG. 526.—Shot comminution of the lower portion of the left humerus. *Spec.* 2847.

CASE 1666.—Private W. Acker, Co. I, 148th Pennsylvania, aged 21 years, received a shot fracture of the right arm at Cold Harbor, June 3, 1864. Amputation at the lower third was performed at a field hospital of the 1st division of the Second Corps, by Surgeon D. E. Kelsey, 64th New York, who contributed the specimen (FIG. 526), which consists of "the lower portion of the humerus, showing double oblique fracture just above the condyles, the inner articular surface having been carried away by a conoidal ball." (*Cat. Surg. Sect.*, 1866, p. 147.) The patient was admitted to Lincoln Hospital on June 11th, and was transferred to Broad and Cherry Streets Hospital, Philadelphia, about four months afterward. On January 6, 1865, he was discharged from service and pensioned. The pensioner was paid on March 4, 1875.

CASE 1667.—Private E. McKnight, Co. D, 2d Massachusetts Cavalry, aged 30, was wounded at Opequan Creek, September 13, 1864, and conveyed to hospital at Sandy Hook. Acting Staff Surgeon N. F. Graham reported: "Gunshot wound of left elbow joint by minié ball, producing much comminution of the joint and shafts of the bones. Double flap amputation at lower third of humerus was performed, on September 14th, by Acting Assistant Surgeon J. R. Uhler. Chloroform used. The patient was debilitated from loss of blood before the operation. Analeptic treatment and simple dressings were employed. Patient transferred on September 17th." Assistant Surgeon R. F. Weir, U. S. A., reported his admission into Frederick Hospital, and transfer therefrom to New York on December 20th, with the remark that necrosis was going on at the date of transfer. On December 21st, the patient was admitted to Central Park Hospital, New York City, whence Surgeon J. J. Milhau, U. S. A., reported, March 28, 1865, "that the stump was much swollen and inflamed, an abscess having formed three inches above the end, discharging freely, and that an incision was made through the end of the stump and four inches of dead bone removed by Acting Assistant Surgeon F. G. H. Bradford." The specimen, represented by the figure in the lower left hand part of PLATE XLVII, was contributed by the operator, and consists of the tubular sequestrum. Acting Assistant Surgeon G. F. Shrady contributed a cast of the stump (FIG. 527), which shows the skin to have been divided into bilateral flaps and the cicatrix deeply depressed in the centre, but apparently firm. (See *Cat. Surg. Sect.*, 1866, p. 543.) The patient was discharged from DeCamp Hospital on September 11, 1865, and pensioned. In his application for commutation, in 1870, he described the stump as being "sound and healthy." He was paid March 4, 1875.

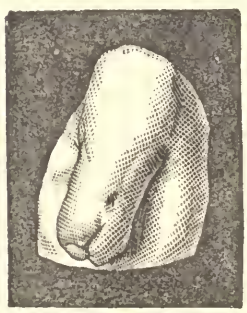

FIG. 527.—Cast of stump of left arm. *Spec.* 1403.

The primary successful amputations at the lower third were practised on three hundred and sixty Union, and forty-six Confederate soldiers. With three exceptions, the limb removed was specified in the four hundred and six amputations, showing a slight predominance of operations on the *right* side, or 212, against 191 amputations of the left arm. The circular method was followed in one hundred and twenty-eight, and the flap method in two hundred operations, this point being unmentioned in seventy-eight cases. Twenty-nine patients were returned to modified duty, three hundred and thirty-seven were discharged, and, for the most part, pensioned and supplied with artificial limbs, twenty-seven were exchanged or paroled, and thirteen remained unaccounted for, on furlough or other absence.

TABLE LXXII.

Condensed Summary of Four Hundred and Six Cases of Recovery after Primary Amputation in the Lower Third of the Shaft of the Humerus.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Aber, D., Pt., D, 111th Pennsylvania.	Sept 17, 18, '62.	Right; flap. Discharged December 27, 1862.
2	Acher, M., Pt., G, 32d Ohio, age 25.	Aug. 21, 21, '64.	Right; flap; by Surg. A. H. Brundage, 32d Ohio. Disch'd May 15, 1865; pensioned.
3	Acker, W., Pt., B, 148th Pennsylvania.	June 3, 4, '64.	Right; by Surg. D. E. Kelsey, 64th N.Y. Dis'd Jan. 6, '65. *Spec.* 2847.
4	*Adams, S. W.*, Serg't, B. 26th Alabama, age 32.	July 1, 1, '63.	Left; circular. Paroled September 25, 1863.
5	Adcock, S., Pt., E, 136th Illinois, age 27.	May 22, 23, '63.	Left; by Surg. L. K. Wilcox, 130th Ill. Dis'd Jan. 22, '64; pen'd.
6	Adkins, E., Pt., D, 112th Illinois, age 38.	Nov. 18, 18, '63.	Right. Discharged April 21, 1864; pensioned.
7	Adriance, J. A., Pt., D, 91st New York.	April 1, 1, '65.	Right; by Surg. R. Morris, 91st N. Y. Disc'd July 31, '65; pens'd.
8	Aldridge, H. W., Pt., D, 22d Kentucky, age 23.	May 5, 5, '64.	Left; by Surg. V. H. Coffman, 34th Iowa. Disc'd July 25, '64; pen'd.
9	Alexander, W., Pt., C, 11th Wisconsin, age 20.	April 9, 10, '65.	Right; flap. Discharged August 22, 1865.
10	Allston, T., Pt., D, 31st Colored Troops.	July 30, 31, '64.	Right; circular; by Surg. G. J. Potts, 23d C. T. Dis'd Mar. 23, '65.
11	*Antery, U.*, Pt., M, 6th Alabama, age 25.	July 1, 1, '63.	Left. Paroled Sept. 23, 1863.
12	Arbuckle, J. N., Pt., F, 123d Indiana, age 21.	Aug. 17, 17, '64.	Left; flap; by Surg. W. P. Welborn, 80th Indiana. Disch'd May 9, 1865; pensioned.
13	Arnold, D. S., Pt., G, 119th Pa., age 37.	May 12, 12, '64.	Left; flap; by Surg. P. Leidy, 119th Pa. Dis'd Mar. 31, '65; pens'd.
14	Arnold, I. N., Pt., E, 69th Ohio, age 24.	Aug. 11, 11, '64.	Left; circ.; by Surg. L. Slusser, 69th O. Dis'd Apr. 10, '65; pen'd.
15	Ashmore, J., Pt., E, 5th New Jersey.	July 1, 1, '62.	Right. Discharged September 7, 1864; pensioned.
16	Aspinwall, J., Pt., H, 12th Wisconsin, age 21.	Mar. 21, 22, '65.	Right; flap. Discharged July 4, 1865.
17	Ayres, B. F., Pt., A, 48th Indiana.	May 16, 16, '63.	Left; flap; by Surg. L. J. Ham, 48th Ind. Dis'd Aug. 7, 1863; pen'd.
18	Baker, P., Pt., B, 1st Louisiana.	May 27, 27, '63.	Right; flap. Discharged June 25, 1864; pensioned.
19	*Balcom, W. J.*, Pt., F, 20th North Carolina.	July 1, 3, '63.	Left. Duty Sept. 25, 1863.
20	Barau, C., Pt., F, 11th Vermont, age 20.	Aug. 21, 21, '64.	Left; flap; by Surg. C. B. Park, 11th Vt. Dis'd Dec. 23, '64; pen'd.
21	Barker, H., Pt., M, 8th N. Y. Artillery.	June 16, 16, '64.	Right; circular; by Surg. A. Satterthwaite, 12th N. J. Disch'd Oct. 11, 1864; pensioned.
22	Barnes, J. J., Pt., E, 82d Penn., age 21.	June 3, 3, '64.	Right; flap. Disch'd June 21, 1865.
23	*Barser, J.*, Pt., A, 38th Virginia, age 24.	Dec. 23, 23, '64.	Circular. Healed.
24	Bayles, J., Pt., E, 5th Colored Troops, age 17.	Feb. 20, 20, '65.	Right; circular; by Surg. M. Tucker, 39th C. T. Dis'd May 26, '65.
25	Beck, J. A., Pt., 154th Co., 2d Battalion V. R. C., age 19.	Nov. 26, 27, '64.	Left; ant.-post. flap; by Surg. J. R. Ludlow, U. S. V. Disch'd Aug. 25, 1865; pensioned.
26	Bell, G. H., Pt., H, 1st Mass. H'y Art., age 32.	May 19, 19, '64.	Right; flap. Disch'd July 8, 1864, pensioned.
27	Belleville, L., Pt., H, 52d Massachusetts.	June 17, 18, '63	Right; by Surg. C. Robertson, 150th N. Y. Disch'd Aug. 14, 1863; pensioned.
28	Bishop, G. W., Pt., F, 6th Kentucky, age 23.	May 27, 29, '64.	Right; flap. Duty Jan. 4, 1865, pensioned.
29	Bissell, G. E., Capt., K, 5th Wisconsin, age 25.	May 6, 6, '64.	Left; ant.-post. flap; by A. Surg. J. W. Davis, 5th Wis. Disch'd July 30, 1864; pensioned.
30	Botts, J., Serg't, D, 15th Missouri, age 26.	May 14, 15, '64.	Right; ant.-post. flap; by Surg. H. E. Hasse, 24th Wis. Disch'd Dec. 30, 1864; pensioned.
31	Bowdish, L., Pt., B, 7th Mich., age 20.	May 6, 6, '64.	Right; flap; by Surg. G. Chaddock, 7th Mich. Disch'd Aug. 22, '64; pensioned.
32	Brandt, D., Pt., I, 17th Penn. Cav., age 20.	Sept. 19, 19, '64.	Right; flap. Disch'd Nov. 30, '64; pensioned.
33	Bransby, T. S., Pt., K, 11th Ohio, age 30.	Feb. 25, 25, '64.	Right; flap. Discharged April 12, 1864; pensioned.
34	*Brantley, B. C.*, Serg't, B, 13th Georgia, age 20.	Sept. 19, 19, '64.	Left; circ.; by A. Surg. Dorsey, 1st Md. C. Pro. Mar. Feb. 11, '65.
35	Bremmer, J. A., Pt., G, 21st Wisconsin, age 21.	May 30, June 1, 1864.	Right; flap; by Surg. J. R. Goodwin, 37th Ind. Disch'd May 31, 1865; pensioned.
36	Brocket, J., Pt., A, 38th Col'd Troops, age 47.	Sept. 29, 30, '64.	Left; circular. Discharged April 10, 1865; pensioned.
37	Brown, B. B., Capt., I, 1st New Jersey, age 37.	May 12, 12, '64.	Right; circular; by Surg. L. W. Oakley, 2d N. J. To V. R. C.; pensioned. *Spec.* 3219.
38	Brown, H. L., Corp'l, D, 29th Conn., age 21.	Oct. 27, 27, '64.	Right; flap; by Surg. G. C. Jarvis, 7th Conn. Disch'd Mar. 8, 1865; pensioned.
39	Brown, J. F., Pt., C, 10th Kentucky, age 26.	July 21, 21, '64.	Left; flap. Duty Nov. 22, 1864; pensioned.
40	Brown, J. R., Serg't, D, 11th Penn., age 21.	June 18, 18, '64.	Right; flap. Duty Nov. 24, 1864; pensioned.
41	Brown, J. S., Corp'l, A, 70th Indiana, age 25.	May 15, 17, '64.	Right; flap; by Surg. A. W. Reagan, 70th Ind. Disch'd Mar. 10, 1865; pensioned.
42	*Brown, R. W.*, Corp'l, I, 61st Alabama, age 31.	Sept. 22, 23, '64.	Right; flap; by Surg. Williams. 6th Ala. To Pro. Mar. April 1, '65.
43	Buchanan, R., Pt., F, 1st Colored Troops, age 22.	June 15, 15, '64.	Left; circular. Discharged Feb. 10, 1865; pensioned.
44	Bush, B., Pt., H, 97th Ohio, age 24.	May 29, 29, '64.	Right; flap; by Surg. E. B. Glick. 40th Ind. Disch'd May 31, 1865; pensioned.
45	Butler, G. B., Lieut., 3d Infantry.	July 4, 4, '63.	Right. Ordered before a Retiring Board Nov. 3, 1863.
46	*Byrd, C.*, Corp'l, I, 33d Alabama, age 21.	Nov. 30, 30, '64.	Right; flap. To Provost Marshal March 1, 1865.
47	*Byres, R. G.*, Serg't, G, 52d Virginia, age 24.	Mar. 25, 25, '65.	Left; circular. Paroled June 18, 1865.
48	Byrne, J., Pt., F, 123d New York, age 18.	July 20, 22, '64.	Left; circular. Disch'd Jan. 19, 1865; pensioned.
49	Calhoun, C. L., Corp'l, K, 118th Penn.; age 35.	Mar. 29, 29, '65.	Right; circular. Disch'd July 6, 1865; pensioned.
50	Call, G., Pt., D, 6th New York Cavalry, age 22.	July 28, 28, '64.	Right; flap. Discharged June 18, 1865; pensioned.
51	Campbell, D., Serg't, K, 139th Penn., age 21.	Sept. 19, 19, '64.	Left; flap; by Surg. S. F. Chapin, 139th Pa. Disch'd Mar. 16, 65; pensioned.
52	Camper, N., Pt., I, 4th Colored Troops, age 35.	June 15, 15, '64.	Right; flap; by Surg. J. W. Mitchell, 4th C. T. Disch'd Mar. 20, '65.
53	Canfield, T. B., Pt., A, 1st Ill. Light. Art., age 21.	July 22, 22, '64.	Right; circular. Disch'd Feb. 6, 1865; pensioned.
54	Canty, C., Pt., L, 1st Mass. Artillery, age 21.	June 18, 18, '64.	Left; circular; by Surg. G. M. Brennan, 1st U. S. S. S. Disch'd Nov. 29, '64; pens'd. *Spec.* 3023.
55	Carey, J., Pt., B, 101st Indiana, age 24.	July 20, 20, '64.	Left; circ.; by Surg. C. N. Fowler, 105th O. Disch'd Mar. 9, 1865; pensioned.
56	Caries, G. W., Pt., G, 21st Ohio.	Aug. 8, 8, '63.	Right; by Surg. D. S. Young, 21st Ohio. Disch'd; pensioned.
57	Cassiday, P., Pt., E, 59th Massachusetts, age 23.	Sept. 30, 30, '64.	Left; circ.; by Surg. W. C. Shurlock, 51st Pa. Disc'd Feb. 20, '65.
58	Cather, W., Pt., E, 32d Illinois.	April 7, 7, '62.	Right. Discharged Aug. 30, 1862.
59	Cayford, J., Pt., H, 19th Maine, age 35.	May 18, 18, '64.	Left; flap; by Surg. N. Hayward, 20th Mass. Disch'd Oct. 31, '64; pensioned.
60	Chapman, W., Pt., D, 45th Illinois.	June 26, 26, '63.	Left; circ.; by Surg. E. L. Hill, 20th Ohio. Disch'd Aug. 9, '63; pensioned.
61	Chappell, J., Pt., D, 53d Indiana, age 46.	June 27, 27, '64.	Right. Disch'd June 8, 1865.
62	Charmoille, C., Pt., B, 146th N. Y., age 34.	June 18, 19, '64.	Right; flap; by Surg. T. M. Flandrau, 146th N. Y. Disch'd April 26, 1865; pensioned.
63	Chidester, J. W., Corp'l, H, 3d Va. Mounted Inf.	Aug. 26, 26, '63.	Left; circular; by Surg. W. B. Wynne, 14th Pa. Cav. Disch'd March 1, 1864; pensioned.
64	Clark, H. M., Pt., D, 18th Michigan, age 27.	Oct. 28, 28, '64.	Right; flap; by Surg. J. Evans, 13th Wis. Disch'd Mar. 24, 1865; pensioned.
65	Clegg, J., Pt., I, 147th New York, age 35.	Feb. 6, 6, '65.	Left. Disch'd March 11, 1865.
66	Coburn, R., Pt., H, 83d Pennsylvania, age 18.	May 8, 10, '64.	Left; double flap. Disch'd Aug. 25, 1864; pensioned.
67	Cochrane, W. S., Pt., K, 11th Penn., age 42.	Feb. 6, 6, '65.	Left; antero-post. flap. Disch'd June 16, 1865; pensioned.
68	Coffman, S., Pt., E, 8th Mich., age 28.	May 5, 5, '64.	Left; antero-post. flap. Disch'd August 11, 1864; pensioned.
69	Colbridge, S. C., Serg't, G, 115th N. Y., age 22.	Sept. 29, 29, '64.	Right; flap; by Surg. C. Macfarlane, 115th N. Y. Disch'd July 29, 1865. *Spec.* 2854.
70	Combs, J. R., Pt., D, 127th Illinois.	July 28, 28, '64.	Right; flap. Discharged June 3, 1865.
71	Coney, C. W. H., Pt., I, 3d Mass. Cav., age 21.	Oct. 19, 19, '64.	Right; flap. Disch'd July 4, 1865; pensioned.
72	Conner, C., Pt., B, 14th Ohio, age 27.	July 21, 22, '64.	Left; flap. Disch'd June 27, '65.
73	Conner, W., Pt., I, 6th N. Y. H. A., age 19.	June 22, 23, '64.	Left; flap; by Surg. C. H. Porter. 6th N. Y. H. A. Disch'd May 17, 1865; pensioned.
74	Conway, J., Serg't, F, 164th N. Y., age 30.	May 18, 18, '64.	Right; by Surg. J. W. Wishart, 140th Pa. Disch'd Dec. 29, '64; pensioned.
75	Cook, J. H., 1st Serg't, G, 16th Indiana.	May 20, 20, '63.	Left; circular; by Surg. G. F. Chittenden, 16th Ind. Disch'd October 23, 1863; pensioned.
76	Cook, W. L., Corp'l, B, 94th New York.	Aug. 30, 30, '62.	Right; flap; by Surg. R. A. Everett, 16th Mich. Disch'd Sept. 13, '62; pensioned.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
77	Cooper, L., Capt., K, 99th Illinois.	May 17, 17, '63.	Left; by Surg. J. H. Ledlie, 99th Ill. Discharged; pensioned.

406	Zug, J. T., Lieut., H, 7th Pennsylvania Reserves.	Dec. 13, 13, '62.	Right. Discharged June 12, '63; pensioned.

One of the operations succeeded an unsatisfactory excision at the elbow. Thirteen of the patients had received severe injuries in other regions, and several underwent simultaneous operations in other parts. Thus, one had the opposite limb amputated at the shoulder, two at the upper third of the arm, one lost a leg, and another submitted to Chopart's operation. There were practised consecutively, on the limbs already mutilated, an exarticulation at the shoulder, three re-amputations at the upper third, six re-amputations in the middle third, an amputation of a leg, six operations on necrosed stumps, a ball extraction, a ligation of the axillary, and a ligation of a minor artery. Consecutive hæmorrhage of a serious nature occurred in seven cases, including that in which a ligature was placed on the axillary. Gangrene supervened in ten cases, and grave erysipelatous inflammation in four cases.

§ *Fatal Cases.*—Of the five hundred and twelve primary amputations at the lower third of the arm for shot injury, one hundred and six or 20.7 per cent. had fatal results. The unsuccessful operations were practised on one hundred and one Union and five Confederate soldiers. Fifty-seven were on the right and forty-eight on the left side, and in one case this particular was not recorded. The proportion of injuries from large projectiles was not excessive. Two patients were mutilated by solid cannon shot, five by shell fragments, and one by the premature explosion of a cannon, but ninety-eight were wounded by small missiles. Eleven patients had serious wounds in other regions than the upper arm, and two of these underwent simultaneous amputations—one of the remaining forearm, the other at mid thigh. A large proportion of the deaths were referred to pyæmia or septicæmic infection. Consecutive operations were practised in six instances. There were two re-amputations of the arm higher up, an amputation of the opposite arm at upper third, a removal of a sequestrum, a removal of a ball and of enlarged ends of nerves, and a ligation of the brachial artery. There were nine cases of hospital gangrene, and four of phlegmonous erysipelas. Consecutive hæmorrhage occurred twice only, including the case in which the brachial was tied. Specimens from nine of the cases are preserved in the Museum. The following is an example:

FIG. 528.—Shot fracture of the olecranon and outer condyles of the right elbow. *Spec.* 3088.

CASE 1668.—Private S. W. Williams, Co. F, 2d United States Sharpshooters, aged 35 years, was wounded by a minié ball in the right elbow, at Petersburg, June 16, 1864, and was amputated on the field, by Dr. A. Garcelon, of Maine, by the circular method. The specimen (FIG. 528) was contributed by the operator, and consists of "the fractured bones of the right elbow. A ball appears to have passed obliquely from rear to front, breaking the posterior surface of the olecranon and chipping the outer condyle. A partial fracture extends above the articulation in the humerus and for the length of the specimen in the ulna. After being received into the hospital of the 3d division of the Second Corps, and transferred thence to the depot hospital at City Point, the patient was, on June 28th, admitted to Armory Square Hospital, at Washington. Surgeon D. W. Bliss, U. S. V., reported: "Amputation at the lower third of the arm was performed, before admission, on account of gunshot fracture. Erysipelas exists at the wound. Simple dressings, stimulants, and nourishing diet were prescribed. The patient died August 4, 1864."

TABLE LXXIII.

Condensed Summary of One Hundred and Six Unsuccessful Cases of Primary Amputation in the Lower Third of the Shaft of the Humerus.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Adair, H., Pt., G, 70th Indiana, age 26.	June 16, 16, '64.	Left; double flap; by Surg. J. W. Hastings, 70th Ind. Died July 20, 1864, traumatic erysipelas.
2	Alexander, P., Pt., F, 11th Wisconsin, age 21.	April 9, 9, '65.	Right; flap. Died May 6, 1865, in typhoid condition.
3	Andrews, C. B., Pt., C, 21st Conn., age 19.	May 16, 16, '64.	Left. Died June 18, 1864.
4	Andrews, G., Pt., E, 54th Ohio.	Aug. 24, 24, '64.	Left; by Surg. A. C. Messenger, 57th Ohio. Died Sept. 24, 1864.
5	Avery, C., Serg't, K, 36th Mass., age 28.	June 3, 4, '64.	Right; lateral flap. Died June 30, 1864, pyæmia.
6	Baldwin, L., Serg't, E, 6th Connecticut.	Aug. 16, 16, '64.	Right. Died Sept. 8, 1864, pyæmia.
7	Baskin, A., Pt., E, 78th Colored Troops.	Dec. 15, 15, '64.	Left; flap. Died Dec. 23, 1864, pyæmia.
8	Blanchard, N. A. D., Pt., K, 61st C. T., age 20.	Oct. 10, 10, '64.	Left; circ.: by Surg. S. J. Quimby, 61st Col'd Troops. Died Feb. 3, 1865, consumption.
9	Brock, J., Pt., G, 97th Indiana.	July 13, 13, '63.	Left; by Surg. A. Goslin, 48th Ill. Died Sept 1, 1863, acute dysentery.
10	Call, L., Corp'l, F, 33d Ohio, age 28.	July 20, 20, '64.	Right; re-amp.; gangrene. Died Nov. 17, 1864, chronic diarrhœa.
11	Campbell, P., Pt., D, 10th N. H., age 37.	May 14, 14, '64.	Right. Died June 4, 1864, typhoid fever.
12	Carleton, H. D., Pt., F, 37th Wisconsin, age 34.	June 17, 17, '64.	Right; circular. Died Aug. 22, 1864, exhaustion.
13	Christy, S., Pt., F, 188th Penn., age 17.	Sept. 29, 29, '64.	Left. Died Nov. 14, 1864, pyæmia.
14	C——, H., Pt., A, 8th N. J., age 25.	June 16, 17, '64.	Left; by Surg. W. Watson, 105th Pa. Died July 19, 1864, exhaustion. *Spec.* 3093.
15	Calwell, A. N., Pt., E, 1st R. I. Artillery.	Nov. 7, 7, '63.	Left; also amp. right forearm; by A. Surg. H. G. Taylor, 8th N. J. Died one hour after operation.
16	Cook, T., Pt., K, 1st New Jersey.	May 10, 10, '64.	Right. Died May 25, 1864.
17	Cooper, H. F., Pt., M, 14th N. Y. H. A., age 34.	May 12, 12, '64.	Left; bilateral flaps. Died June 9, 1864, typhoid fever.
18	Cottrell, A. H., Pt., F, 4th Minnesota.	Oct. 5, 5, '64.	Left; by Surg. E. J. Buck, 18th Wisconsin. Died Oct. 19, 1864.
19	Cox, P., Pt., G, 66th Ohio, age 42.	May 29, 29, '64.	Right; circular; by Surg. J. W. Brock, 66th Ohio. Died Sept. 21, 1865, chronic diarrhœa.
20	Coyne, J., Pt., I, 170th New York.	June 16, 16, '64.	Left. Died June 20, 1864.
21	*Cronan, J.*, Pt., E, 10th Louisiana, age 27.	May 12, 12, '64.	Right; circ.; hæmorrhage June 1; lig. brachial. Died June 2, '64.
22	Crumbie, P., Serg't, G, 123d N. Y., age 19.	May 25, 25, '64.	Right; circ.; by A. Surg. L. W. Kennedy, 123d New York. Died.
23	Cullins, D. P., Pt., G, 155th N. Y., age 20.	June 3, 3, '64.	Left; circ.; by Surg. F. Wylie, 155th N. Y. Died July 7, 1864, pyæmia.
24	*Daily, J.*, Pt., Clynch's Georgia Art., age 42.	Dec. 13, 13, '64.	Right; by Surg. J. A. Lair, 53d Ohio. Died Feb. 11, 1865.
25	Davenport, A., Pt., C, 170th New York.	May 24, 24, '64.	Left; by Surg. M. F. Regan, 164th N. Y. Died June 18, '64, pyæmia.
26	Davis, J. K. P., Pt., E, 37th Mass., age 19.	June 11, 11, '64.	Right. Died July 29, 1864, irritative fever.
27	Etter, S., Corp'l, K, 1st Missouri S. M. Cav.	Oct. 13, 14, '63.	Right. Died November 2, 1863.
28	Ewell, K., Serg't, L, 8th N. Y. H. A., age 23.	Oct. 27, 28, '64.	Right; circular; by Surgeon A. Churchill, 8th N. Y. H'vy Art. Died Jan. 2, 1865, pyæmia.
29	F—— T., 16th Pa. Cav., age 24.	Sept. 9, 9, '64.	Right; flap; by A. A. Surg. J. F. Thompson; (wound of thigh and testicles.) Died Oct. 16, 1864, exhaustion. *Spec.* 3210.
30	Flinn, F., Corp'l, G, 46th Ohio.	Sept. 1, 1, '64.	Left; by Surg. R. Morris, 103d Ill. Died Sept. 2, 1864.
31	Flynn, J., Pt., E, 17th Conn.	July 1, 1, '63.	Left. Died July 14, 1863.
32	Gillaspie, A., Pt., I, 2d Penn. Art.	June 17, 17, '64.	Right; Died July 23, 1864.
33	Gough, J., Pt., H, 118th New York, age 46.	May 16, 16, '64.	Left. Died June 27, 1864.
34	Gowran, J., Pt., G, 59th New York, age 22.	July 27, 28, '64.	Left; circular; by Surg. D. W. Maull, 1st Del. Gangrene; removal nerve and necrosed bone. Died Dec. 7, 1865, typhoid fever.
35	Hartzel, S., Pt., A, 184th Penn., age 22.	June 23, 23, '64.	Left; by Surg. G. F. Winslow, U. S. N.: (also penetrating wound of chest.) Died June 30, 1864. *Spec.* 3008.
36	Harvey, G. B., 1st Lieut., E, 10th Tenn. C., age 29.	Dec. 4, 4, '64.	Right; circular; by Surg. J. E. Herbst, U. S. V. Died Jan. 2, 1865, pyæmia.
37	Hedglin, J. W., Pt., B, 184th Penn., age 22.	June 3, 3, '64.	Right; by Surg. G. Chaddock, 7th Mich. Died July 1, '64, debility.
38	H——, J., Pt., K, 109th New York, age 23.	June 17, 17, '64.	Right; circular. Died July 19, '64, pyæmia. *Spec.* 4741.
39	Howser, M., Pt., C, 30th Colored Troops.	Feb. 11, 11, '65.	Left; circ.; by Surg. L. Barnes, 6th Colored Troops. Died April 9, 1865, chronic dysentery.
40	Jackson, H., Pt., E, 4th Colored Troops.	Sept. 20, 20, '64.	Left; (also amp. thigh.) Died Oct. 11, 1864, exhaustion.
41	Jackson, S., Pt., G, 58th Mass., age 45.	June 1, 3, '64.	Right; circular. Died July 4, 1864, exhaustion.
42	Jernauld, W. F., Lieut., C, 97th Indiana.	July 13, 13, '63.	Left. Died July 31, 1863.
43	Johnson, J. J., Pt., B, 83d Indiana.	June 27, 27, '64.	Right; by Surg. A. C. Messenger, 57th Ohio. Died June 27, 1864.
44	King, J., Pt., C, 185th New York, age 32.	Mar. 29, 29, '65.	Right; circular. Died May 19, 1865, pyæmia.
45	King, J., Pt., D, 141st Penn., age 20.	May 6, 6, '64.	Right; by Surg. H. F. Lyster, 5th Mich. Died June 3, 1864.
46	Kinnan, L. J., Pt., D, 179th New York, age 41.	June 17, 17, '64.	Right. Died June 25, 1864.
47	Lafferty, G. W., Pt., K, 53d Penn., age 25.	May 12, 12, '64.	Left. Died June 11, 1864.
48	LaF——, G., Pt., E, 26th New York.	Dec. 13, 13, '62.	Right; flap; (also wound of knee joint.) Died Jan. 14, 1863, pyæmia. *Spec.* 718.
49	Libby, J. W., Pt., I, 20th Maine.	Oct. 1, 1, '64.	Left. Died Nov. 8, 1864.
50	Long, J. C., Corp'l, G, 145th Pennsylvania.	June 7, 7, '64.	Right; by Surg. G. L. Potter, 145th Pa. Died July 2, '64, pyæmia.
51	*Major, W. N.*, Pt., 11th South Carolina.	May 13, 13, '64.	Right; (also wound of side.) Died May 14, 1864.
52	McDermott, J., Pt., H, 71st New York.	June 17, 17, '64.	Left; ant.-post. flap. Died July 21, 1864, exhaustion.
53	McGonigal, A. M., Pt., I, 126th Pennsylvania.	Dec. 13, 13, '62.	Right. Died Dec. 31, 1862.
54	McHenry, W., Corp'l, B, 123d Ind., age 39.	June 27, 27, '64.	Right; by Surg. C. D. Moore, 13th Ky. Died July 20, 1864.
55	McLane, J., Pt., H, 155th New York.	May 18, 18, '64.	Right; by Surg. M. Rizer, 72d Pa. Died May 23, 1864.
56	McKinley, W. D., Pt., D, 84th Indiana.	June 27, 27, '64.	Right; by Surg. C. J. Walton, 21st Ky. Died July 11, 1864.
57	*Merchison, J.*, Pt., I, 27th Georgia.	June 1, 2, '64.	Right; irregular flaps; by Surg. Matthews, C. S. A. Gangrene; re-amp.; erysipelas. Died June 25, 1864.
58	Merrick, T. L., Corp'l, E, 51st Penn.	June 17, 17, '64.	Right; by Surg. W. C. Shurlock, 51st Pa. Died June 20, 1864.
59	Miller, A. J., Pt., G, 93d Pennsylvania.	Oct. 19, 19, '64.	Right; circular. Died November 16, 1864, peritonitis.
60	Miller, J., Pt., I, 4th Michigan.	June 27, 29, '62.	Right; flap. Died July 19, 1862; *post-mortem*.
61	Miller, P., Pt., D, 8th Col. Troops, age 21.	Sept. 29, 30, '64.	Left; circular. Died November 27, 1864, exhaustion.
62	Miller, P., Pt., A, 13th W. Virginia.	Sept. 4, 4, '64.	Left; by A. A. Surg. J. R. Uhler. Died Sept. 12, 1864, erysipelas.
63	Minor, H., Pt., E, 49th Missouri, age 23.	April 4, 4, '65.	Right; by Surg. E. Powell, 72d Ill. Died April 13, 1865.
64	Mooney, J., Pt., E, 147th Pennsylvania.	July 20, 20, '64.	Right. Died August 11, 1864.
65	Moulton, S. J., Pt., C, 17th Vermont, age 19.	June 3, 3, '64.	Left. Died June 25, 1864.
66	Newton, C., Corp'l, E, 5th New York Cav.	Sept. 19, 19, '64.	Right. Died October 19, 1864, pyæmia.
67	Nickerson, R., Pt., E, 19th Maine.	July 3, 3, '63.	Right. Died July 21, 1863.
68	Patrick, J. W., Pt., I, 27th Indiana, age 22.	May 28, 28, '64.	Left; circular. Died July 8, 1864, variola.
69	P——, N. R., Pt., F, 5th W. Virginia, age 23.	Sept. 3, 5, '64.	Left; lateral flap; by A. A. Surg. J. Younglove. Died Sept. 16, '64, double pleurisy. *Spec.* 3868.
70	Pierson, W. T., Pt., G, 6th Maryland.	Oct. 19, 19, '64.	Left; flap; hæmorrhage. Died Nov. 8, 1864, pyæmia.
71	Potter, H. C., Corp'l, H, 2d N. Y. H'y Art., age 20.	June 6, 6, '64.	Left; circular; by Surg. G. L. Potter, 145th Penn. Died Aug. 2, 1864, gangrene.
72	Pullam, T., Pt., H, 50th Ohio, age 23.	Aug. 3, 3, '64.	Left; by Surg. S. K. Crawford, 50th Ohio. Died Oct. 12, 1864, consumption.
73	Quinn, A., Serg't, H, 183d Penn., age 30.	June 10, 10, '64.	Left; circular. Died July 12, '64, exhaustion.
74	Renka, A., Pt., C, 26th Wisconsin.	May 16, 16, '64.	Right; by Surg. W. P. Hobbs, 85th Ind. Died June 2, 1864.
75	Renn, J., Pt., G, 69th New York, age 42.	June 3, 3, '64.	Right; by Surg. J. A. Spencer, 69th N. Y. Died June 15, 1864.
76	Riley, C. H., Pt., C, 61st New York, age 28.	June 3, 3, '64.	Right; ant.-post. flap; by Surg. C. T. Stevens, 77th N. Y. Died June 29, 1864, typhoid fever.
77	Robinson, P., Pt., F, 203d Pennsylvania.	Jan. 15, 15, '65.	Right; circular; by Surg. G. C. Jarvis, 7th Conn. Died Feb. 23, 1865, gangrene.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
78	Russell, D., Pt., F, 13th Colored Troops, age 30.	April 1, 1, '65.	Left; flap; by A. A. Surg. H. C. Hill. Died Apr. 7, '65, prostration.	92	Tinklepaugh, S., Pt., G, 49th Penn., age 28.	May 5, 6, '64.	Right; circular. Died August 21, 1864.
79	*Ruth, J.*, Pt., H, 6th Arkansas, age 32.	Nov. 30, Dec. 1, 1864.	Right; flap; amp. of left arm Jan. 2; gangrene. Died March 26, 1865, exhaustion.	93	T——, P. H., Pt., K, 34th Indiana, age 27.	June 27, 27, '63.	Left. Died June 29, 1863. *Spec.* 1637.
80	Sawyer, H., Pt., D, 8th Kansas, age 18.	Dec. 15, 15, '64.	Left; circular. Died Feb. 2, 1865, pyæmia.	94	Vasconsellos, M., Pt., C, 23d Mass., age 19.	Mar. 14, 14, '62.	Right; circular; by A. Surg. S. E. Stone, 23d Mass. Died April 12, 1862, pyæmia.
81	Schelbie, G., Pt., E, 11th Missouri, age 24.	Dec. 16, 17, '64.	Right; circular; by A. Surg. W. B. Trull, U.S.V. Gang.; erysip. Died Dec. 30, '64, irritative fever.	95	Wakeman, M., Pt., H, 5th Michigan.	June 16, 16, '64.	Left; by Surg. H. F. Lyster, 5th Mich. Died April 25, 1865.
82	Shouldise, H., Pt., I, 81st Indiana, age 19.	July 4, 4, '64.	Left; circ.; by Surg. J. D. Brumley, U. S. V. Died Aug. 1, 1864, chronic diarrhœa.	96	Walters, W., Pt., H, 2d New York Il'vy Art.	June 16, 16, '64.	Left; circ.; by Surg. J. W. Wishart, 140th Penn. Died July 21, 1864.
83	Smith, H. C., Corp'l, E, 8th Michigan, age 29.	July 2, 3, '64.	Left; circular. Died July 31, '64, pyæmia.	97	Webb, H., Pt., C, 186th New York, age 18.	April 2, 2, '65.	Right; circular; by A. Surg. J. H. Kimball, 32d Maine. Died May 1, 1865, pyæmia.
84	Smith, J., Farrier, B, 3d Michigan Cav., age 28.	June 10, 10, '65.	Left; circular; by A. Staff Surg. J. Roberts. (Also w'd side; severe hæmorrhage.) Died June 23, 1865, pleurisy.	98	Welch, J., Pt., D, 69th New York.	May 31, 31, '64.	Right. Died July 11, 1864.
85	South, W., Corp'l, A, 145th Pennsylvania.	May 10, 10, '64.	Right; circular; by Surg. J. W. Wishart, 140th Penn. Died May 23, 1864.	99	West, J. O., Pt., I, 31st Maine.	May 12, 12, '64.	By A. Surg. A. G. Sprague, 7th R. I. Died May 23, 1864.
86	S——, J., Lieut., C, 88th New York.	May 5, 5, '64.	Left; by Surg. W. O. Meagher, 69th N. Y. Died May 8, 1864. *Spec.* 3116.	100	White, A., Corp'l, F, 140th Penn., age 23.	May 10, 10, '64.	Left; circ.; by Surg. J. W. Wishart, 140th Penn. Died June 13, 1864, pyæmia.
87	Stang, C., Corp'l, D, 24th New Jersey.	Dec. 13, 13, '62.	Left; (also wound of both legs.) Died December 20, 1862.	101	Williams, S. W., Pt., F, 2d U. S. S. S., age 35.	June 16, 16, '64.	Right; by Dr. A. Garcelon. Died August 4, 1864. *Spec.* 3088.
88	Stropper, S., Pt., H, 30th Mass., age 29.	Oct. 19, 20, '64.	Right; ant.-post. flaps. Died Dec. 4, 1864, pneumonia.	102	Willoughby, J. R., Pt., 37th Wis., age 21.	July 6, 6, '64.	Left; flap; by Surg. W. B. Fox, 8th Mich. Died Sept. 12, 1864, debility.
89	Tarbox, C. M., Pt., E, 109th N. York, age 40.	June 16, 16, '64.	Left; circular. Died June 29, '64, exhaustion.	103	Wymer, H., Corp'l, F, 57th Penn., age 23.	June 16, 16, '64.	Left. Died July 12, 1864, exhaustion.
90	Taylor, J., Pt., K, 7th Rhode Island, age 37.	June 6, 6, '64.	Right. Died July 6, 1864, irritative fever.	104	Yanson, H., Pt., F, 91st New York, age 25.	April 2, 2, '65.	Right; ant.-post. flaps. Died May 6, 1864, exhaustion.
91	Thambray, J. A., Pt., H, 1st N. Y. Art., age 30.	Sept. 30, Oc. 1, '64.	Right; flap. Died November 2, 1864, exhaustion.	105	Young, J. T., Pt., I, 38th Ohio, age 19.	June 21, 21, '64.	Right; circ.; by Surg. J. Hallen, 38th Ohio. Died July 30, 1864, gangrene.
				106	Young, J. W., Pt., C, 55th Ohio, age 18.	Mar. 19, 19, '65.	Left; circular. Died April 16, '65, typhoid fever.

Case 1669.—Private G. L———, Co. E, 26th New York, was wounded at Fredericksburg, December 13, 1862, and entered Lincoln Hospital on the 24th. Surgeon H. Bryant, U. S. V., contributed the specimen, consisting of the soft tissues of the stump of the right arm, amputated in the lowest third (*Cat. Surg. Sect.*, 1866, p. 502, *Spec.* 718), and recorded the following history: "He received three wounds. Two of these were gunshot wounds of the right arm, and one of them an injury of the right knee joint. The upper wound of the arm was caused by a musket ball perforating the biceps. Another ball entered the arm lower down, fractured the lower part of the humerus and penetrated the elbow joint. In consequence of this latter wound the arm was amputated at its lower third on December 13th. The stump was very painful and was much swollen at first. After application of cold dressings the swelling, tenderness, and pain began to subside, but left the soft parts having a gangrenous appearance. Fomentations were then applied, after which the stump improved rapidly and continued to do well. The treatment thus far was stimulating and sedative. On the 2d of January, there began to be symptoms of arthritis affecting the knee joint. The wound near this joint had emitted a copious and constant discharge. Cold-water dressings were applied for one or two days, when an alterative treatment was substituted. On the 5th, the patient had a high fever and night sweating. Tonics were now added to the treatment. The swelling and pain of the knee joint now began to subside; but on the 9th, symptoms of pyæmia were noticed. The stimulants were doubled and nourishment was freely administered. Nausea, accompanied at night by profuse sweating, soon supervened, and the patient continued to sink until January 14th, when he died. The autopsy was performed twenty-seven hours after death. There was but slight muscular rigidity at the time. The lower extremity was first examined. The limb was swollen and infiltrated with serum. Upon laying open the knee joint and the muscles of the thigh, the extensor muscles were found to be dissected up to the hip joint by a large collection of fibrinous, flaky, and tenacious pus of a gray color, which emitted an offensive odor of sulphuretted hydrogen. The abscesses thus laid open communicated with the knee joint, and extended posteriorly, behind the tibia, under the deep fascia, down the leg. In the knee joint was found extensive erosion of the cartilage upon the articular surfaces of the femur and tibia, especially of the former, the internal condyle of which was partly denuded. An oval island of cartilage was left upon its extremity, the denudation being especially at the borders. The internal articular facet of the tibia was also more affected than the external. A dark deposit was found upon the synovial membrane, which extended above the patella, and also over the crucial ligaments, thus appearing upon the whole synovial membrane. The thorax was next examined. The lungs presented a mottled, black, and reticulated appearance. Melanic matter was found in the parenchyma. The black spots were distinguishable by their feeling from the other portions of the lung. This melanic deposit was found in all parts of the lung, but especially posteriorly. The bronchial glands were enlarged and were as black as ink. In the abdomen the liver was large and finely mottled. The gall bladder was light colored. The spleen had a very light color, was enlarged and rather hard. Both kidneys were large and pale. The intestines were full of gas, the colon being especially distended."

4. Primary Amputations of the Arm, without Indication of the Seat of Incision.—Two hundred and forty-seven cases of primary amputation of the upper arm were reported, in which the precise seat of operation was not specified. Although there is no reason to question their authenticity, their defectiveness in detail detracts from their statistical value, and, in proportion to their number, impairs the exactness of conclusions deducible from

the preceding series. When, however, it is considered that the total number of primary amputations of the arm under consideration is three thousand two hundred and fifty-nine, and that the results as to fatality are ascertained in all, it will be admitted that the uncertainty as to the precise seat of seven per cent. of the operations does not greatly vitiate the conclusions.

§ *Successful Cases.*—Only seventy-seven of the cases of primary amputations of the arm for shot injury thus briefly recorded resulted in recovery. These seventy-seven operations were practised on sixty-four Union and thirteen Confederate soldiers. The injuries were caused by shell fragments in three instances; in the remainder, by small projectiles. In nine instances, the limb implicated was not specified; in sixty-eight, the operations were equally divided between the right and left sides. Eight of the patients returned to modified duty, nine were exchanged or paroled, one was sent to a lunatic asylum, fifty-two were discharged, and seven are not accounted for. Three patients received serious wounds in other regions of the body. Eight survived re-amputations, in one instance at the shoulder joint. One underwent an amputation of the opposite arm. Few details of these cases are reported save those recorded in the tabular statement.

TABLE LXXIV.

Condensed Summary of Seventy-Seven Cases of Recoveries after Primary Amputation of the Arm, the Point of Ablation Unspecified.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Ackerly, N. S., Pt., K, 48th New York.	July 18, 18, '63.	Left. Discharged Nov. 16, 1863.	24	*Edwards, R. D.*, Private, Blunt's Battery.	April 1, 1, '65.	Right. Recovered.
2	Adams, M., Civilian.	May 17, 17, '64.	Left. Recovered.	25	Fairchild, L., Col., 2d Wisconsin.	July 1, 1, '63.	Left. Recovery; union by first intention.
3	Alsen, H., Pt., I, 8th Wisconsin.	May 22, 22, '63.	Right; by Surg. M. W. Fish, 11th Missouri. Discharged.	26	Fernald, C. O., Pt., B, 4th Maine, age 21.	July 21, 21, '61.	Right; by Surg. S. C. Hawkins, 4th Me. Aug. 1, 1861, re-amp. Disch'd Oct. 27, '61; pensioned.
4	Anderson, J. B., Pt., F, 17th Michigan.	Nov. 23, 23, '63.	Right; by Surg. G. B. Coggswell, 29th Mass. Recovered.	27	Franklin, W. F., Pt., C, 14th Indiana.	Dec. 13, 13, '62.	Right. Discharged May 7, 1863.
5	*Bantwell, J. O.*, Pt., A, 59th Georgia, age 25.	July 2, 2, '63.	Right. Exchanged Oct. 3, 1863.	28	Frazer, A. H., Lt., F, 51st Illinois.	Nov. 5, 5, '62.	Right. Resigned Aug. 6, 1864.
6	*Banty, N. I.*, Pt., G, 61st Virginia, age 22.	June 6, 6, '64.	Right. Sent to prison August 11, 1864.	29	Fuller, W., Serg't, I, 20th New York S. M.	July 2, 2, '63.	Left. Duty Sept. 11, 1863.
7	Batchelor, S. K., Corp'l, K, 7th Md., age 35.	June 19, 19, '64.	Left; by Surg. A. A. White, 8th Md. July 8, '64, re-amp. Discharged Dec. 26, '64; pensioned.	30	*Galland, M.*, Pt., G, 11th Alabama, age 19.	July 3, 3, '63.	Left. To Provost Marshal Sept. 10, 1863.
8	Beamer, A., Pt., G, 125th Pennsylvania.	Sept. 17, 17, '62.	Right. Discharged Dec. 8, 1862.	31	Gelbart, T., Pt., B, 20th New York.	Sept. 17, 18, '62.	Left. Disch'd May 5, 1863; pensioned. Sept. 9, 1863, re-amp.
9	Beck, L., Corp'l, A, 3d Missouri.	Dec. 25, 27, '61.	Right. Discharged; pensioned.	32	Gould, A. E., Pt., A, 127th Illinois.	May 19, 19, '63.	Right; by Surg. H. Z. Gill, U. S. V. Discharged Sept. 3, 1863.
10	Bixler, J. A., Pt., C, 5th U. S. Artillery.	Sept. 17, 18, '62.	Left. Discharged Dec. 5, 1862; pensioned; re-amputated.	33	Gatshall, H., Pt., D, 48th Pennsylvania.	Aug. 30, Sc. 1, '62.	Right. Discharged Oct. 9, 1862; pensioned.
11	Borden, J. E., Pt., I, 7th Wisconsin, age 36.	May 5, 5, '64.	Right. Disch'd December 27, 1864.	34	Gray, O. B., Lieut., E, 120th New York.	July 2, 2, '63.	Right. To V. R. C. Oct. 9, 1863.
12	*Bradshaw, J. A.*	May 17, 17, '64.	Right. Sent to Provost Marshal Sept. 11, 1864.	35	Gregory, J. M., Lieut., H, 2d Connecticut Art.	Oct. 19, 19, '63.	Right; by Surgeon H. Plumb, 2d Conn. Art. Disch'd Jan. 10, '65.
13	*Burgart, T.*, Pt., D, 18th Mississippi.	May 3, 3, '63.	Left. June 25, 1863, exchanged.	36	Griswold, L. S., Pt., D, 14th Connecticut.	Sept. 17, 17, '62.	Left; by Surg. H. Janes, 3d Vt.; re-amp. Dis'd Jan. 24, '63; pen'd.
14	Caldwell, S., Pt., D, 88th Pennsylvania.	Sept. 17, 17, '64.	Left; hæmorrhage. Disch'd April 23, 1865. Died Jan. 17, 1866.	37	*Hall, J. D.*, Pt., G, 10th Alabama, age 21.	July 2, 2, '63.	Left. Exchanged May 1, 1864.
15	Campion, P., Serg't, K, 20th Massachusetts.	Dec. 13, 13, '62.	Right. Discharged January 8, 1864.	38	Harbison, W., Pt., K, 27th Indiana, age 23.	May 3, 3, '63.	Left. Discharged Dec. 2, 1863.
16	Clark, R., Serg't, G, 83d Indiana.	May 19, 19, '63.	Left. Discharged August 27, '63.	39	*Hatcher, R.*, Pt., F, 24th Alabama.	Sept. 19, 19, '63.	Right. Recovered.
17	*Cobb, H. L.*, Pt., D, 14th Tenn.	Dec. 13, 13, '62.	Right. Sent to prison February 23, 1863.	40	Henson, H. H., Pt., E, 19th Col. T., age 22.	Dec. 16, 16, '64.	Right. Discharged April 14, 1865.
18	Collin, T., Freedman, age 35.	Mar. –, –, '64.	Left; gangrene; (also frac. right hand; hæmorrhage; amp. right arm.) Discharged July 19, 1864.	41	Hoover, W. H., Pt., F, 11th New Jersey.	May 3, 3, '63.	Left. To V. R. C. Feb. 4, 1864.
19	Converse, L., Lieut., 2d New Hampshire.	July 2, 2, '63.	Right. Mustered out Aug., 1865.	42	Hoppy, E., Pt., D, 2d Artillery.	July 21, 21, '61.	Left. July 31, 1861, re-amp. Dis'd Feb. 24, 1862; pensioned.
20	Conway, L. N., Pt., B, 11th Iowa.	July 22, 23, '64.	Left. Discharged; pensioned.	43	Hughes, I., Pt., E, 19th Indiana.	July 1, 3, '63.	Right. Discharged Sept. 28, 1863.
21	Coulter, W. B., Captain, 53d Pennsylvania.	Dec. 13, 13, '62.	Right. Resigned April 8, 1864.	44	Hughes, J., Pt., B, 18th Massachusetts.	May 3, 3, '63.	Right. Disch'd March 4, 1864.
22	*Dawson, M.*, Pt., B, 9th Alabama, age 23.	July 3, 3, '63.	Left. Sent to Provost Marshal September 1, 1863.	45	Hunting, B., Corp'l, C, 3d Iowa, age 37.	Sept. 17, 18, '61.	Left; by A. Surg. D. M. Cool, 3d Iowa. Dis'd Nov. 7, '61; pens'd.
23	Dooley, J. H., Capt., F, 40th Indiana.	Nov. 25, 26, '63.	Right; by Surg. A. W. Heise, 100th Ill. Disch'd Feb. 10, 1864; pensioned.	46	Jeffries, W., Pt., F, 49th Colored Troops.	June 7, 7, '63.	Right. Discharged July 23, 1863.
				47	Jones, T. M., Pt., G, 22d Illinois.	Nov. 7, 8, '61.	Left. Discharged Jan. 1, 1862.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
48	Julian, P., Lieut., B, 54th Indiana.	July 12, 12, '63.	Left. Duty August 10, 1863.
49	Junge, A., Pt., H, 28th Wisconsin, age 39.	Mar. 31, Ap. 1, '65	Right; by Surg. C. Winne, 77th Ill. Discharged June 20, 1865.
50	Kercheval, E. R., Lieut., 6th Indiana Cavalry.	Aug. 29, 29, '62.	Left. Resigned February 17, '63.
51	Lenix, C., Pt., 26th Pennsylvania.	July 3, 3, '63.	Right. Discharged August 24, 1864.
52	*Leonard, T. H.*, Pt., C, 24th Alabama.	Sept. 19, 19, '63.	Recovery.
53	Marks, E., Pt., B, 17th Wisconsin.	May 16, 17, '63.	Left. Discharged August 8, '63; pensioned.
54	Martineau, A., Pt., A, 118th New York.	Oct. 27, 28, '64.	Left; by Surg. W. V. Harrison, C. S. A. Re-amp. Dec. 9, '64. Disch'd May 10, '65; pensioned.
55	Mead, J., Pt., I, 58th Indiana.	Dec. 31, 1862, Jan. 1, 1863.	Left; by Surg. J. R. Adams, 58th Ind. Amp. at shoul. joint Feb. 4, 1863. Disch'd August 13, '63; pensioned.
56	Meyer, H., Corp'l, H, 58th New York.	Aug. 28, 28, '62.	Duty. October 14, 1862.
57	Nugent, A. A., Pt., I, 21st Wisconsin, age 16.	Mar. 19, 20, '65.	Right; by Surg. J. T. Reeves, 21st Wis. Disch'd May 16, 1865; pensioned.
58	Orlanzo, P., Pt., E, 3d Artillery, age 28.	May 20, 20, '64.	Right; erysipelas. To St. Elizabeth January 20, 1865.
59	Paden, J., Pt., E, 16th Ohio.	June 19, 19, '61.	Right. Discharged August 18, 1861; pensioned.
60	*Pate, C. A.*, Pt., C, 24th Alabama.	Sept. 19, 19, '63.	Recovery. Union by first intention.
61	Pelton, W., Pt., E, 7th Ohio.	Nov. 27, 27, '63.	Left. Discharged January 22, 1864.
62	Phillipe, A., Pt., A, 72d New York.	May 5, 5, '62.	Discharged March 17, 1863.
63	Price, J., Pt., E, 50th Ill.	April 6, 6, '62.	Recovered.
64	Porter, S. A., Capt., B, 104th Illinois.	Sept. 19, 19, '63.	Left. Resigned August 25, 1864.
65	Readington, H., Pt., G, 7th Indiana.	Mar. 23, 23, '62.	Left. Discharged June 18, 1863.
66	Rollins, O., Pt., G, 10th Missouri.	Oct. 4, 4, '62.	Discharged May 16, 1863.
67	Seward, S. H., Lieut., H, 14th Conn.	May 6, 6, '64.	Left; by Surg. T. A. Dudley, 14th Conn. Disch'd July 29, '64; pen.
68	Simmons, J. Y., Pt., K, Missouri Home Guards.	Aug. 6, 6, '61.	Right. Discharged; pensioned.
69	Small, W. F., Pt., A, 100th New York.	May 31, 31, '62.	Discharged July 10, 1862.
70	Smalley, I. R., Serg't, K, 104th New York.	Dec. 12, 12, '62.	Discharged February 16, 1863.
71	Tilley, W., Pt., G, 9th Maine.	July 18, 18, '63.	Left. Discharged Oct. 14, 1863.
72	Tilton, W. L., Pt., K, 149th N. Y., age 28.	June 27, 27, '64.	Right; by A. Surg. H. E. Goodman, U. S. V.
73	Van Horn, W., Pt., I, 89th Illinois.	Nov. 25, 25, '63.	Left. Discharged August, 1865.
74	Wilcox, J., Pt., C, 3d Wisconsin.	Aug. 9, 9, '62.	Discharged November 17, 1862.
75	*Wise, J. F.*, Pt., H, 20th South Carolina.	Oct. 19, 20, '64.	Left. Exchanged.
76	Woolbridge, W. R., Corporal, G. 29th Iowa.	April 2, 2, '64.	Left. Discharged June 21, 1865.
77	Wright, A., Pt., C, 76th Ohio.	Jan. 11, 11, '63.	Right. Discharged April 17, '63; pensioned.

Fatal Cases.—One hundred and seventy cases of the series of two hundred and forty-seven primary amputations for shot injury of the upper arm, but without more explicit indication of the seat of operation, had fatal terminations—a percentage of mortality of 68.9. The right limb was involved in sixty-six, the left in fifty-eight, of the hundred and twenty-four cases in which this point was noted. The operations were practised on one hundred and sixty-five patients, of whom twelve were Confederates. Five patients submitted to synchronous amputations of both arms. In nine cases, the injuries were inflicted by shell fragments; in two, by the premature explosion of cannon; in one hundred and fifty-four, by small projectiles. Four patients underwent simultaneous amputations of the thigh, and four of the leg, and one an excision in the shaft of the opposite humerus. Two patients submitted to re-amputation higher up, and one to a resection of the protruding end of the humerus. One patient was drowned, two died of tetanus, five from the effects of consecutive hæmorrhage, three from gangrene, and twelve from pyæmia. In the large majority of cases, there was no indication of the proximate cause of death.

Table LXXV.

Condensed Summary of One Hundred and Seventy Fatal Primary Amputations of the Arm, the Point of Ablation Unspecified.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Allen, A., Pt., E, 109th New York, age 19.	June 17, 17, '64.	Died June 26, 1864, chronic diarrhœa.
2	Allen, C., Pt., E, 9th Indiana.	Dec. 13, 13, '61.	Died February 13, 1862.
3	Allen, R., Corp'l, A, 13th Ohio.	Nov. 25, 25, '63.	Right. Died Dec. 20, 1863.
4	Alleywood, R., Pt., E, 5th Michigan.	July 3, 3, '63.	Right. Died July 27, 1863.
5	*Anderson, W. T.*, Corp'l, C, Cutts' Georgia Art.	Prim'ry.	Died December 10, 1863.
6	Anguish, H., Pt., I, 157th New York.	July 1, 3, '63.	Right. Died July 26, 1863, pyæmia.
7	*Anthony, N. M.*, Pt., G, 21st Mississippi.	Prim'ry.	Left. Died December 15, 1862.
8	Arms, A. J., Pt., H, 71st New York.	July 2, 2, '63.	Right; (also amputation of thigh.) Died July 3, 1863.
9	Arnold, O. W., Corp'l, K, 105th Ohio.	Sept. 19, 19, '63.	Right. Died November 9, 1863.
10	Atkinson, J. C., Pt., I, 28th Pennsylvania.	July 20, 20, '64.	Left. Died Sept. 27, 1864.
11	Babbett, C. F., Lieut., A, 141st New York.	July 20, 20, '64.	Right. Died July 21, 1864.
12	*Bakling, D.*, Pt., F, 1st Tennessee.	Oct. 8, 8, '62.	Died October 22, 1862.
13	Barkel, F., Corp'l, A, 77th Indiana.	Dec. 16, 16, '64.	Died January 14, 1865.
14	Bear, A., Pt., G, 29th Iowa.	April 2, 2, '64.	By Surg. A. Shaw, 29th Iowa. Died June 19, 1864.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
15	Benbow, W., Pt., A, 39th Indiana.	Sept. 20, 20, '63.	Left. Died September 29, 1863, tetanus.
16	Benson, H., Pt., F, 9th Maine.	May 20, 20, '64.	Right. Died June 1, 1864, gangrene.
17	Berry, G. H., Corp'l, B, 16th Maine.	Dec. 13, 14, '62.	Right. Died January 2, 1863, pyæmia.
18	Bissinott, J. S., Pt., B, 11th Infantry.	Aug. 18, 18, '64.	Left; by Surg. A. A. White, 8th Maryland. Died Aug. 29, 1864.
19	Blandikou, C., Pt., A, 9th Wisconsin.	April 4, 4, '64.	Right; by A. Surg. W. L. Nicholson, 29th Ia. Died April 6, '64.
20	Bonner, J., Pt., G, 63d Colored Troops.	June 7, 7, '63.	Left. Died June 24, 1863.
21	Bowden, F., Pt., K, 16th Maine.	July 2, 2, '63.	Right. Died July 20, 1863.
22	Boyles, D. J., Pt., D, 1st Maryland.	June 9, 9, '63.	Left; (also wound of hip.) Died July 3, 1863.
23	Boyle, J., Pt., I, 19th Massachusetts.	Dec. 13, 13, '62.	Right; by Surg. J. F. Dyer, 19th Mass. Died January 2, 1863.
24	Burgess, F. M., Lieut., H, 14th Kentucky.	July, 1864.	Left. Died August 10, 1864.
25	Burse, H. H., Pt., E, 11th Maine.	July 26, 26, '64.	Died July 26, 1864.
26	Byrnes, D. L., Pt., D, 11th Michigan.	Dec. 31, 31, '62.	Left. Died January 2, 1863.
27	Canty, J., Pt., 5th Mass. Battery, age 36.	July 3, 3, '63.	Right; hæmorrhage. Died July 7, 1863.
28	Carter, G. W., Corp'l, A, 70th Ind., age 19.	May 15, 15, '64.	Right; by Surg. A. W. Reagan, 70th Ind. Died July 16, 1864, consumption.
29	Cash, F. W., Pt., F, 15th New Jersey.	May 3, 3, '63.	Died May 15, 1863.
30	Castner, J. C., Pt., H, 1st Ohio.	Nov. 25, 25, '63.	Died December 23, 1863.
31	Cero, C., Pt., D, 20th Massachusetts.	Dec. 13, 13, '62.	Left. Died December 31, 1862.
32	Chapman, F., Pt., K, 76th New York.	July 3, 4, '63.	Right. Died July 8, 1863.
33	Chase, D. P., Capt., A, 2d U. S. S. S.	May 3, 3, '63.	Right. Died May 8, 1863.
34	Clendenning, C. W., S'g't, K, 143d Penn.	May 6, 6, '64.	Left. Died June 1, '64, pyæmia.
35	Cole, E. I., Pt., C, 140th Penn., age 29.	July 3, 3, '63.	Left. Died Aug. 2, '63, pyæmia.
36	Colvin, S. D., Lieut., F, 36th Indiana.	Sept. 19, 19, '63.	Left. Died October 9, 1863.
37	Conklin, C., Pt., C, 25th Mass., age 22.	Feb. 8, 8, '62.	Died February 13, 1862.
38	Coulson, G. H., Pt., E, 78th Ohio.	July 22, 22, '64.	Left; by Surg. J. S. Reeves, 78th Ohio. Died August 4, 1864.
39	Cramer, S., Pt., B, 142d Pennsylvania.	July 1, 1, '63.	Left; (also amputation of thigh.) Died July 9, 1863.
40	Crowningshield, L. C., Pt., G, 142d N. Y.	Dec. 25, 25, '64.	Left; (also amputation of leg.) Died January 11, 1865.
41	DeFrictes, F. F., Corp'l, G, 114th Illinois.	Dec. 15, 16, '64.	Right; (also wound of head and leg.) Died December 16, 1864.
42	Degarmo, C., Pt., I, 12th Wisconsin.	July 22, 22, '64.	Right; by Surg. E. M. Reeves, 12th Wis. Died Sept. 20, 1864.
43	Denziger, N., Pt., H, 7th New York.	Dec. 13, 13, '62.	Right. Died January 18, 1863.
44	Dickinson, E. J., Pt., H, 23d Mass., age 23.	May 16, 16, '64.	Left. Died June 17, '64, pyæmia.
45	Dille, L., Pt., D, 140th Pennsylvania.	July 3, 3, '63.	By Surg. C. S. Wood, 66th N. Y.; (wound of thigh, scrotum, and penis.) Died July 19, 1863.
46	Dirlan, H. S., Lieut., G, 41st Ohio.	Nov. 25, 25, '63.	Right. Died December 18, 1863.
47	Dixon, W. C., Pt., B, 78th Illinois.	June 27, 27, '64.	Right. Died August 1, 1864.
48	Dorson, J., Pt., H, 76th New York.	July 1, 1, '63.	Left. Died.
49	Dowd, F., Pt., F, 12th Connecticut.	Mar. 27, 27, '63.	Died April 3, 1863.
50	Durbin, J., Serg't, K, 49th Ohio.	June 18, 18, '64.	Right. Died July 12, 1864.
51	Durkee, H., Pt., H, 21st Ohio.	Aug. 10, 10, '64.	Right; (also wound of side.) Died August 20, 1864.
52	Ebringhaus, E., Pt., A, 54th New York.	Feb. 10, 10, '65.	Left. Died March 7, '65, typhoid fever.
53	Feeman, L., Corp'l, H, 16th Ohio.	July 12, 12, '64.	Left. Died August 4, 1864.
54	Fiske, R., Pt., B, 124th Illinois, age 34.	Mar. 30, 30, '65.	By A. Surg. C. A. Bucher, 72d Ill.; (also wound of leg.) Died April 21, 1865.
55	*Freeman, J.*, Rebel prisoner, age 21.	June 17, 17, '64.	Left; (also wound of lung.) Died June 21, 1864, exhaustion.
56	Fruit, E., Serg't, K, 41st Illinois.	July 11, 11, '63.	Left; by Surg. J. L. Dicken, 47th Indiana. Died July, 1863.
57	Fultex, F., C, 11th Connecticut, age 46.	May 16, 16, '64.	Right. Died June 18, '64, pyæmia.
58	Gabert, W., Pt., A, 60th Indiana.	Jan. 11, 11, '63.	Left; by Surg. J. W. F. Gerrish, 67th Ind.; (also wound of leg.) Died January 29, 1863.
59	Gault, A., Serg't, F, 4th Ohio, age 22.	May 27, 27, '64.	Left. Died Aug. 19, '64, pyæmia.
60	Genung, S., Pt., G, 13th Illinois.	Dec. 29, 29, '62.	Died April 1, 1863.
61	Geyer, C. G., Pt., I, 2d Illinois Art., age 28.	Aug. 21, 21, '64.	Left. Died Sept. 18, '64, pyæmia.
62	Gibbs, S. E., Serg't, F, 2d Conn. Artillery.	June 1, 1, '64.	Left. Died June 2, 1864.
63	Giles, C., Serg't, B, 17th Infantry.	July 3, 3, '63.	Left. Died July 16, 1863, gangrene.
64	Gillin, J., Pt., F, 44th N. Y., age 28.	May 23, 23, '64.	Left; by Surg. M. W. Townsend, 44th N. Y.; hæmorrhage; re-amputation June 3. Died June 26, 1864, gangrene.
65	Goodruff, G. S., Pt., G, 8th Vermont.	Oct. 19, 19, '64.	Died October 20, 1864.
66	Grossman, W., Pt., C, 11th Pa. Reserves, age 23.	May 8, 9, '64.	Right; by Surg. W. Lyons, 11th Pa.; (amp. leg.) Died Aug. 3, '64.
67	Grouse, J., Pt., I, 52d Ohio, age 46.	Sept. 1, 1, '64.	Left. Drowned Dec. 28, 1864.
68	Groves, J. H., Corp'l, H, 58th Indiana.	Dec. 31, 31, '62.	Died January 16, 1863.
69	Hardy, J. H., Pt., 60th Ohio.	June 17, 17, '64.	Right. Died June 21, 1864.
70	Harlin, M. M., Pt., G, 70th Indiana.	Prim'ry.	(Wound of face and arm.) Died July 9, 1864.
71	Harrington, W., Pt., B, 55th Illinois.	April 6, 6, '62.	Died May 11, 1862.
72	Haynes, J. F., Pt., G, 1st Me. H'vy Art.	June 20, 20, '64.	(Wound of both legs and thorax.) Died June 22, 1864.
73	Heger, A., Corp'l, D, 7th New York.	Mar. 31, 31, '65.	Died April 1, 1865.
74	Heistand, M., Pt., A, 49th Ohio.	Sept. 19, 19, '63.	Left. Died Dec. 30, 1863.
75	Higgins, J., Pt., A, 1st Rhode Island Art.	July 3, 3, '63.	By Surg. J. F. Dyer, 19th Mass. Died July 8, 1863.
76	Hillman, T., Pt., G, 27th Indiana.	May 3, 3, '63.	Right. Died May, 1863.
77	Holbrook, H., Lieut., M, 3d Rhode Island Art.	Aug. 19, 19, '63.	Died Aug. 21, 1863.
78	Holenback, A., Pt., K, 149th New York.	May 3, 3, '63.	Right. Died June 12, 1863.
79	Holley, J., Pt., C, 83d Ohio.	Jan. 11, 11, '63.	Right; by Surg. J. B. Sparks, 19th Ky. Died Feb. 9, 1863.
80	Holman, J. H., Pt., A, 12th Wisconsin.	July 22, 22, '64.	Left; by Surg. H. McKennan, 17th Wis. Died Sept. 17, 1864.
81	Holmes, G. W., Lieut., C, 113th Ohio.	Sept. 19, 19, '63.	Left. Died Oct. 10, 1863.
82	Howe, H. L., Serg't, F, 89th New York.	Sept. '64, Prim'ry.	Died Sept. 30, 1864.
83	Hubelier, E. W., Pt., I, 72d Pennsylvania.	Dec. 13, 13, '62.	Left. Died Jan. 4, 1863.
84	Hulbert, J. H., Corp'l, D, 4th Vermont.	May 5, 5, '64.	Left. Died May, 1864.
85	Hunkerfillar, W. R., Pt., B, 19th Alabama.	Sept. 19, 19, '63.	Tetanic symptoms. Died Oct. 17, 1863.
86	Jaynes, N., Pt., E, 11th West Virginia.	Oct. 19, 19, '64.	Died Oct. 19, 1864.
87	Jenning, W., Pt., A, 22d Michigan.	Sept. 19, 19, '63.	Right. Died of wounds.
88	Jigler, D., Pt., H, 53d Indiana.	Oct. 5, 5, '62.	(Wound of arm and leg.) Died.
89	Kerney, D., Pt., D, 2d Missouri.	Sept. 19, 19, '63.	Right. Died Nov. 29, 1863.
90	Lachine, L., Pt., D, 1st	June 18,	Right and left; (other injuries.)
91	New York Art.	18, '64.	Died June 20, 1864.
92	Larew, J., Corp'l, C, 83d Ohio.	Jan. 11, 11, '63.	Left; by Surg. J. W. F. Gerrish, 67th Ind. Died Feb. 4, 1863.
93	Leach, L. N., Pt., E, 2d U. S. S. S.	May 5, 6, '64.	Left. Died May 12, 1864.
94	Leonard, P., Pt., A, 13th Ohio.	Dec. 31, 31, '62.	Left. Died March 1, 1863, pyæmia.
95	Limberger, W., Serg't, D, 11th Indiana.	May 16, 16, '63.	Died May, 1863.
96	Long, C., Pt., F, 3d Infantry.	July 3, 3, '63.	Left; (also wound of leg.) Died July 24, 1863.
97	Lynch, P., Serg't, E, 100th New York.	July 18, 18, '63.	Right. Died August 15, 1863.
98	Martin, J., Pt., B, 124th Ohio.	May 26, 26, '64.	Died May, 1864.
99	Martin, J., Pt., F, 102d New York.	Aug. 9, 9, '62.	Died August 27, 1862.
100	*Martin, J. B.*, Corp., C, 14th Virginia.	July 3, 3, '63.	Right. Died July 10, 1863.
101	Maux, L., A, 15th New York Heavy Artillery.	Aug. 18, 18, '64.	By Surg. A. A. White, 8th Maryland. Died August 22, 1864.
102	McClosky, A., D, 20th Kentucky.	April 6, 6, '62.	Right. Died April 28, 1862, pyæmia.
103	McConnell, G., Pt., I, 14th New York.	July 3, 4, '63.	Left; (also wound of chest.) Died July 8, 1863.
104	McCorns, W. J., Pt., G, 6th Indiana.	May 15, 15, '64.	Right. Died May 21, 1864.
105	McHugh, O., Pt., D, 37th	Dec. 13,	Both. Died.
106	New York.	13, '62.	
107	McNally, P., Major, 2d West Virginia.	Aug. '63, Prim'ry.	Left; (also wound of chest.) Died September 22, 1863.
108	McNeal, E., Pt., K, 52d Ohio.	July 20, 20, '64.	Left. Died August 21, 1864.
109	Mears, J., Pt., K, 63d Ohio.	Oct. 3, 3, '62.	Left. Died October 4, 1862.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
110	Messeroe, G. G., Pt., G, 127th New York.	Dec. 9, 9, '64.	Left. Died December 18, 1864.
111	*Moore, D.*, Corp'l, C, 9th Georgia.	May 5, 6, '64.	Died May 7, 1864.
112	Morehouse, G. G., Serg't, I, 14th Illinois.	Oct. 5, 5, '62.	Right. Died November 2, 1862.
113	Morrell, R., Pt., E, 108th New York.	Sept. 17, 17, '62	Died October 4, 1862.
114	Nichols, J., Pt., K, 90th New York.	May 27, 27, '63.	Right; by Surg. C. Robertson, 159th N. Y. Died July 12, 1863.
115	Oehsle, S., Pt., E, 58th Illinois.	Oct. 3, 3, '62.	Died October 24, 1862.
116	Peer, J. O., Pt., H, 22d Michigan.	Sept. 19, 19, '63.	Right. Died October 15, 1863.
117	*Permen, H.*, Pt., I, 14th Alabama.	July 3, 4, '63.	Left. Died July 12, 1863.
118	Phillips, P., Pt., D, 99th Pennsylvania, age 24.	May 9, 9, '64.	Died May 22, 1864.
119	Pierce, J. M., Pt., F, 145th Pennsylvania.	May 3, 3, '63.	Right; (also wound of lung;) by Surg. F. Reynolds, 88th New York. Died June 14, 1863.
120	Pierce, T. J., Pt., B, 12th New Hampshire.	May 3, 3, '63.	Right. Died June 20, 1863.
121	*Pierson, D. W.*, Rebel prisoner, age 39.	June 24, 24, '64.	Right. Died June 27, 1864, exhaustion.
122	*Pool, J.*, Pt., B, 16th Ga.	July, 1863.	(Wound of arm and leg.) Died July 6, 1863.
123	*Propft, J.*, Pt., D, 10th Missouri.	July 4, 4, '63.	Left; erysipelas and hæmorrhage. Died Aug. 6, 1863.
124	Ralston, J., Lieut., B, 54th Indiana.	Dec. 29, 29, '62.	Died Jan. 12, 1863.
125	Ray, S., Serg't, D, 81th Illinois.	Sept. 2, 2, '64.	Also amputation of leg. Died Sept. 6, 1864.
126	Rhinhart, A. J., Pt., A, 18th Penn. Cav.	Sept. 19, 19, '64.	Left. Died Oct. 16, 1865.
127	Richardson, G. W., Pt., B, 9th Tennessee.	Oct. 8, 8, '62.	Died Oct. 8, 1862.
128	Riggs, A., Pt., E, 60th Illinois.	Sept. 1, 1, '64.	Right. Died Sept. 8, 1864.
129	Roller, J., Pt., C, 11th Illinois.	May 22, 22, '63.	Right. Died July 28, 1863.
130	Rubio, C., Pt., I, 97th N. York.	June 2, 2, '64.	Died October 25, 1864.
131	Ruppurball, H., Pt., A, 39th Illinois, age 20.	May 20, 20, '64.	Right. Died June 18, 1864, exhaustion.
132 133	Savage, G., Pt., A, 2d Ct. Artillery.	June 1, 1, '64.	Both. Died June 4, 1864.
134	Savage, P., Pt., I, 4th Artillery.	Sept. 19, 19, '63.	Right. Died Oct. 9, 1863.
135	Schroeder, C. J., Pt., D, 51st New York.	Dec. 13, 13, '62.	Died Dec. 30, 1862.
136	Seagar, J. G., Pt., I, 11th Missouri.	Sept. 19, 19, '62.	Left; (also wound of abdomen.) Died Sept. 21, 1862.
137	Shaffer, J., Pt., D, 18th Infantry.	July 3, 3, '64.	Right; (also wound of side.) Died July 16, 1864.
138	Smiller, E., Pt., D, 41st Ohio.	Nov. 25, 25, '63.	Died Nov. 25, 1863.
139	Smith, H., Corp'l, F, 2d New Hampshire.	May 5, 5, '62.	Died June 7, 1862.
140	Smith, I., Pt., H, 104th Illinois.	Sept. 19, 19, '63.	Right. Died Oct. 9, 1863.
141	Snyder, G., Pt., I, 1st Delaware.	Dec. 13, 13, '62.	(Wound of arm and chest.) Died Dec. 13, 1862.
142	Soper, A., Pt., E, 30th Illinois.	July 22, 22, '64.	Left. Died August 8, 1864.
143	Speetes, J., Pt., H, 35th Ohio.	Sept. 19, 19, '63.	Right. Died Oct. 15, 1863.
144	Standish, G. W., Pt., K, 4th Massachusetts.	June 14, 14, '63.	Right. Died June 29, 1863, diarrhœa.
145	Steinmaker, F., Serg't Maj., 59th New York.	July 3, 3, '63.	Left. Died July 12, 1863.
146	Stetson, S. N., Pt., B, 32d Maine.	May 31, 31, '64.	Right. Died June 22, 1864.
147	Stevens, A. P., Lieut., F, 17th Michigan.	Nov. 16, 16, '63.	Right. Died December 11, 1863.
148	Stoufer, F., Pt., F, 18th Infantry.	Dec. 31, 31, '62.	Left. Died January 10, 1863.
149	*Stowe, J.*, Pt., F, 57th North Carolina.	Prim'ry.	Right. Died December 6, 1863.
150	Strein, J., Pt., F, 55th Pennsylvania.	Sept. 29, 29, '64.	Right. Died October 2, 1864.
151 152	Tanner, T. B., Pt., D, 3d Rhode Island Art.	July 10, 10, '63.	Both; secondary hæmorrhage. Died August 9, 1863.
153	*Thorn, T. J.*, Lieut., D, 16th N. C., age 30.	July 3, 4, '63.	Right; (also amp. at thigh.) Died July 30, 1863, pyæmia.
154	Tincher, J., Pt., C, 57th Indiana.	Dec. 16, 16, '64.	Right. Died January 2, 1865.
155	Tinckham, T. L., Pt., H, 33d Wisconsin.	April 24, 24, '64.	Right; (also excision left humerus.) Died April 25, 1864.
156	Tousley, L. M., Pt., C, 15th Mass., age 27.	Sept. 17, 17, '62.	Left. Died September 29, 1862.
157	Triece, J. H., Pt., B, 56th Pennsylvania.	May 6, 6, '64.	Died May 6, 1864.
158 159	Vannatta, L., Pt., A, 23d Wisconsin.	Jan. 11, 11, '63.	Both; by Surg. J. W. F. Gerrish, 67th Ind. Died March 6, 1863.
160	Wadley, A. H., Pt., G, 31st Maine.	May 18, 18, '64.	Right; by Surg. W. R. D. Blackwood, 48th Pa. Died July 2, '64.
161	Wait, M. C., Pt., D, 39th Illinois, age 21.	June 23, 23, '64.	Right. Died July 2, 1864, exhaustion.
162	Walters, A. P., Pt., C, 150th Penn.	May 5, 5, '64.	Died August 25, 1864.
163	Welch, W., Pt., G, 88th New York.	Sept. 17, 17, '62.	Right. Died October 16, 1862.
164	Wheeler, G. M., Pt., E, 6th Indiana.	Nov. 25, 25, '63.	Right. Died December 16, 1863.
165	Williams, J. W., Pt., F, 8th Iowa.	April 6, 6, '62.	Died May 6, 1862.
166	Wilson, I. N., Pt., K, 16th Maine.	Dec. 13, 13, '62.	Right. Died January 6, 1863.
167	Wilson, J., Pt., 21st New York Battery.	Mar. 27, 27, '65.	Left; (also amp. thigh.) Died March 27, 1865.
168	Wood, J. H., Pt., B, 4th New Jersey, age 21.	May 6, 6, '64.	Right; hæmorrhage; re-amputation May 28, 1864. Died June 1, 1864, pyæmia.
169	Wood, O., Pt., F, 86th Indiana.	Nov. 25, 25, '63.	Left. Died December 26, 1863.
170	Yothas, A., Pt., H, 148th Pennsylvania.	May 2, 2, '63.	Left. Died June 9, 1863.

Over four-fifths of the patients enumerated in the foregoing statement perished within thirty days from the reception of the injury.[1] But few found their way to general hospitals, which partly accounts for the paucity of reported details. The surgical statistician has often occasion to observe a predominance of fatal cases in series imperfectly recorded.

This group completes the tabulation of the three thousand two hundred and fifty-nine reported primary amputations for shot injury of the arm in the continuity, with a fatality of six hundred and two cases, or 18.4 per cent.

Intermediary Amputations in the Continuity.—In nine hundred and two of the series of fifty-four hundred and fifty-six cases of amputation of the arm for the effects of shot injury, or in about one-fifth of the forty-five hundred and seventy-two cases in which the precise date of amputation was ascertained, the operations were practised during the interval from the third to the thirtieth day, inclusive, from the date of the reception of the injury. The mortality rate was 33.4 per cent., or 15 per cent. greater than after primary amputation in the same region.

[1] Of the 165 patients represented in the foregoing statement of 170 operations, 48 died in the first, 22 in the second, 34 in the third, 22 in the fourth week from the dates of operation.

1. Intermediary Amputations in the Upper Third of the Arm.—Three hundred and forty-seven cases are classified in this category, with a mortality rate of 31.1 per cent.

§ *Successful Cases.*—Two hundred and thirty-nine cases of intermediary amputation at the upper third of the arm recovered. The operations were practised on two hundred and thirty-one Union and eight Confederate soldiers. Nearly a tenth of the amputations succeeded excisions, ligations, or amputations lower down in the limb. In some instances operative intervention was demanded by uncontrolable hæmorrhage or by rapidly spreading gangrene. In other cases constitutional disturbance was so grave that delay was adjudged more hazardous than interference. Often the reasons for regarding intermediary amputation as advisable or compulsory were not reported, as in the following case:

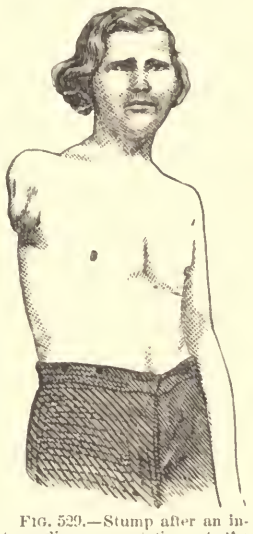

FIG. 529.—Stump after an intermediary amputation at the upper third of the arm.

CASE 1670.—Private C. Dunn, Co. L, 5th Michigan Cavalry, aged 27 years, was wounded at Newtown, November 12, 1864. He was received into the hospital of the 1st division, Cavalry Corps, where Assistant Surgeon C. I. Wilson, U. S. A., recorded: "Shot fracture of right humerus. Splints and bandages applied. Arm amputated on November 20th, by muscular flap method, at surgical neck of humerus, by Assistant Surgeon H. B. Noble, 2d Ohio Cavalry. General condition of patient bad; reaction slow. Treatment: Simple dressings and stimulants. January 14, 1865, patient recovered and sent to General Hospital." He was afterward treated at McKim's Mansion, Baltimore, and lastly at Broad and Cherry Streets Hospital, Philadelphia. On April 23, 1865, the patient was discharged from service and pensioned. Examiner H. O. Hitchcock, of Kalamazoo, Michigan, May 20, 1866, reported: "Wound entirely healed, but occasionally reopens and discharges for a time. Health perfect, except now and then, in damp weather and on the approach of a storm, some neuralgia about the stump. Has not used an artificial arm because of difficulty of attaching it to his body." The pensioner was shot at Kalamazoo, by some unknown person, on the 16th day of May, 1869, and died the same day. The pension examiner contributed a photograph of this pensioner, which is copied in the wood-cut (FIG. 529).

Several amputations were in cases in which primary excisions of the diaphysis were likely to terminate disastrously. In the following, amputation was resorted to when an attempt at intermediary excision in the shaft proved abortive:

CASE 1671.—Private W. Johnson, Co. E, 7th Rhode Island, aged 24 years, was wounded in the right arm, at Fredericksburg, December 13, 1862, and entered the Patent Office Hospital, at Washington, four days afterward. Acting Assistant Surgeon H. Stone contributed the specimen (FIG. 530), with the following description: "This case might be somewhat instructive as an illustration of the extent to which a musket ball may break up the shafts of the long bones in passing through them, and also of the necessity of a thorough exploration of such fractures before undertaking any method of conservative treatment. The case is that of W. Johnson, admitted to this hospital, for gunshot fracture of the right humerus, on December 17th. When admitted, extreme œdematous effusion, with extensive vesication of the arm and forearm, existed, caused by binding of splints to the arm by cords, without the usual roller having been first applied to the forearm and upward. The cords and splints were immediately removed, and for twenty-four hours the arm was treated for the removal of the œdema by the application of stimulating liniments, bandages, and by elevated position of the extremity. At the end of that period the swelling had been sufficiently reduced to admit of an examination of the fracture and the performance of such operation as might be indicated. The ball had entered the arm anteriorly, at the upper portion of the middle third, and, passing diagonally downward through the humerus, came out posteriorly, two inches above the elbow joint. Upon passing the finger into the anterior wound loose fragments of bone were found, which indicated that probably two inches of the shaft had been so broken up as to require resection, which was decided upon. The wound was laid open upward, and the shattered end of the upper portion of the humerus removed by the saw. Upon cutting downward to prepare for the removal of the jagged end of the lower portion, the shaft was found to have been split down in three splinters and completely broken off close to the condyles. Upon this discovery the resection was abandoned and amputation decided upon, and performed by the bilateral flap operation at the point, or a little above, of the insertion of the anterior portion of the deltoid muscle. The section of the humerus, preserved among the fragments of the specimen, it was decided to remove, so that sound flaps could be obtained above the lacerated and inflamed parts about the fracture. Cold-water dressings were applied to the stump for eight or ten days, afterward cerate and lint. The flaps healed by first intention. On January 15, 1863, Johnson received his discharge from service, and left the hospital." The specimen consists of the two lower thirds of the right humerus, shattered for six inches by a conoidal ball. A portion of the battered missile is attached. In a section of the upper extremity of the specimen the attempt at excision is shown. In his application for commutation, 1870, the pensioner reported the stump as healed, and stated that Surgeon J. D. Robinson, U. S. V., performed the amputation. He was paid June 4, 1875.

FIG. 530.—Shot fissures of right humerus—intermediary amputation. *Spec.* 486.

The period of convalescence was usually more protracted after intermediary than after primary amputations. In some cases, however, the stumps promptly healed. More vessels needed to be tied, as a rule, than in primary operations. In the following case an exorbitant number of ligatures were required:

CASE 1672.—Corporal W. A. Emerson, Co. H, 16th Massachusetts, aged 25 years, was wounded at White Oak Swamp, June 30, 1862, and admitted to Ascension Church Hospital, at Washington, four days afterward. Acting Assistant Surgeon W. W. Keen, jr., forwarded the specimen (FIG. 531), with the following history of the case: "The patient, previous to his enlistment a watchmaker, and in excellent health, was wounded in the right arm four and a half inches below the shoulder joint; the ball entering on the antero-internal surface, making its exit on the postero-external surface, passing directly through the humerus and making a comminuted fracture. He entered the hospital July 4th with nothing save a cold-water dressing; there were maggots in the wound; these were destroyed by dilute Labarraque's solution, and the arm was dressed on an internal angular splint in hopes of union. July 5th, some fragments of bone were extracted; the pus was of a dark grumous character; several large pieces of bone were left, as they were adherent by periosteum and might unite. July 8th, other pieces of bone were removed; the discharge is still unhealthy and sanious; the health of the man is much impaired, and he has a small bed-sore on his hip, but his mind is so cheerful that he bears up under suffering and danger with remarkable fortitude. I placed him on quinine and sulphate of iron, each two grains, four times a day, with milk punch and beef tea, and as immediate union was not to be hoped for, the arm was laid straight on a padded splint, and half a grain of sulphate of morphia was administered each night, inducing good sleep. July 19th, the suppuration still continued of the same character, and pieces of bone were still extracted every two or three days. There being no hope now of saving the arm, the man's health failing daily, Surgeon R. H. Coolidge, U. S. A., Medical Inspector, amputated in the surgical neck of the humerus by internal and external flaps, with but little hæmorrhage, the subclavian artery being compressed. The wound was united by silver wire and adhesive strips, and cold-water dressings employed—ten ligatures having been applied. Half a grain of morphia was immediately administered. July 20th, slept well; wound uniting by first intention; appetite good; a little suppuration in the track of the ligatures. July 23d, has slept well; the wound mostly united save a little of the edges, which were everted by the cutting out of the wires; seven of the ligatures came away with ease; dressings the same. July 28th, removed the adhesive plasters and applied others, as the first were loose; two other ligatures came away; wound doing admirably; dressed with resin cerate. August 3d, the remaining ligature came away; continued dressings. Sulphate of iron and sulphate of quinine, with milk punch, broths, and some little meat, was now allowed." The specimen consists of a portion of the shaft of the humerus, much comminuted at the junction of the upper thirds. Slight osseous deposit has occurred on a few of the fragments, but there is no attempt at union. A fragment of bullet is attached. The patient was discharged from service September 8, 1862, on certificate, by Surgeon J. C. Dorr, U. S. V., in charge of Ascension Church Hospital. In his application for commutation, 1870, the pensioner reported the stump as being in a "healthy condition." He was paid on June 4, 1875.

FIG. 531.—Shot comminution of shaft of right humerus, amputated intermediarily. *Spec.* 26.

Diseased conditions of stumps were more frequent than after primary amputations, and there were several instances of necrosis of the protruding extremity of the humerus.

CASE 1673.—Private W. Lambert, Co. C, 148th Pennsylvania, aged 21 years, was wounded in the left arm, at Chancellorsville, May 3, 1863, and was operated upon at a Second Corps Hospital. Surgeon A. Heger, U. S. A., in charge of the Point Lookout Hospital, contributed the specimen (FIG. 532), with the following history of the case, by Acting Assistant Surgeon T. Siebold: "The patient was wounded on May 3d, and amputation by circular method was performed on May 11th, at the junction of the upper and middle thirds. He arrived here on June 14th, from Aquia Creek Hospital. July 10th, the stump had opened again and was, in the whole circumference, gangrenous, of the soft pulpous variety; bone of humerus protruding three-fourths of an inch. General condition of the patient better than would naturally be expected. Ordered the stump to be syringed every hour with diluted solution of chlorinated soda, and picked lint and dressings to be wet with the same. July 21st, the wound has improved nicely; the gangrenous action was stopped on the second day, and, on the third day, red, fresh granulations were to be seen all over. Extracted to-day a loose piece of humerus, which is a fine specimen of the destructive action of osteomyelitis. One-third of an inch long the entire bone became necrosed, and nearly two inches more at the longest point, and one inch more at the shortest, only the inner portion, the outer or cortical portion remaining intact. Only a few drops of blood followed the extraction. In place of the marrow there were already healthy granulations. The same treatment was continued, only the solution weaker and at longer intervals, gradually coming down to two or three times a day. August 21st, the wound has closed entirely, only a little proud flesh, as large as a pea, protruding yet, which was touched with nitrate of silver." The specimen consists of a delicate tubular sequestrum, nearly two inches in length, removed from the stump of the left humerus ten weeks after amputation. The patient was discharged on September 24, 1863, but re-entered the service on May 12, 1865, as captain of the 124th United States Colored Troops. He was ultimately mustered out on October 24, 1865, and pensioned. He died on March 29, 1868. The cause of his death is not known.

FIG. 532.—Sequestrum from an amputation of the left arm. *Spec.* 1806.

Thirty-three of the cases reported in the succeeding table furnished specimens for the Army Medical Museum.

TABLE LXXVI.

Condensed Summary of Two Hundred and Thirty-Nine Cases of Recovery after Intermediary Amputation in the Upper Third of the Shaft of the Humerus.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Akers, G. W., Pt., C, 40th Illinois.	April 6, 19, '62.	Right; by A. Surg. D. Stahl, 10th Ill. Dis'd April 13, '63; pens'd.
2	Albritton, W., Pt., E, 13th Tennessee Cav., age 24.	April 12, 15, '64.	Right; flap; by Asst. Surg. J. C. G. Happersett, U. S. A. Disch'd July 22, 1864; pensioned.
3	Allender, J. B., Pt., A, 121st Penn., age 29.	May 8, 24, '64.	Left; by Surg. D. W. Bliss, U. S. V.; (exc. of elbow joint May 8, '64.) Disch'd Sept. 5, 1864; pens'd.
4	Allison, J. M., Pt., M, 1st Artillery, age 23.	May 16, June 15, 1864.	Left; flap; by A. A. Surg. W. P. Moon. Disch'd Sept. 16, 1864; pensioned. *Spec.* 3612.
5	Anderson, W. F., Pt., Knapp's Penn. Battery.	Sept. 17, 26, '62.	Circular; by Asst. Surg. C. A. McCall, U. S. A. Disch'd Nov. 24, 1862; pensioned. *Spec.* 168.
6	Arnold, P., Pt., B, 30th Indiana, age 21.	Sept. 1, 19, '64.	Left; circ.; by A. Surg. T. A. McGraw, U. S. V. Disch'd Sept. 29, 1864; pensioned.
7	Arnst, G., Pt., I, 143d Penn., age 19.	July 1, 7, '63.	Left; circular. Discharged Jan. 7, 1864; pensioned.
8	*Arthur, F. W.*, Pt., F, 57th Virginia, age 32.	July 2, 7, '63.	Left. Paroled Sept. 25, 1863.
9	Ault, J., Pt., C, 101st Indiana, age 28.	Nov. 25, Dec. 8, 1863.	Left; by Surg. C. Soellheim, 9th O.; (exc. humerus Nov. 25, '63.) Disch'd June 4, '64; pensioned.
10	Bailey, J. S., Corp'l, F, 1st U. S. S. S.	May 4, J'e 3, '63.	Left; circular. Discharged Aug. 26, 1863.
11	Barnett, C. M., Pt., F, 3d New Jersey Cavalry.	Aug. 21, Se. 11, '64.	Right; by A. A. Surg. M. Rizer. Disch'd Jan. 9, 1865; pensioned.
12	Barnett, S. L., Pt., K, 130th Pennsylvania.	Sept. 17, 27, '62.	Left; circ.; by Surg. H. Palmer, U. S. V. Dis'd Jan. 16, '63; pens'd.
13	Barnett, W. B., Lieut., B, 97th Ohio, age 28.	June 22, July 20, 1864.	Right; circ.; by A. A. Surg. L. E. Keeley. Duty Dec. 14, '64; pensioned. (Par. exc. June 22, '64.)
14	Baronouski, F., Pt., K, 46th Pennsylvania.	Sept. 14, 17, '62.	Left; flap. Disch'd Dec. 15, 1862; pensioned.
15	Battin, T., Corp'l, C, 25th Ohio.	May 2, 14, '63.	Right. Discharged Sept. 17, 1863; pensioned.
16	*Beck, S. E.*, Lieut., B, 53d N. C., age 50.	July 3, 10, '63.	Left. Exchanged March 3, 1864.
17	Beers, W., Corp'l, C, 15th New Jersey, age 30.	May 3, 28, '63.	Right; flap; by Surg. R. Sharpe, 15th N. J. Dis'd Nov. 20, '63; pen.
18	Belton, A., Pt., H, 10th Kentucky.	Sept. 20, 23, '63.	Left. Discharged Dec. 11, 1863; pensioned.
19	Berger, P., Pt., F, 11th Mass., age 28.	May 6, 16, '64.	Left; flap. Disch'd Oct. 5, 1865; pensioned.
20	Billman, W., Pt., G, 87th Indiana.	Sept. 19, Oct. 1, '63.	Discharged December 8, 1863; pensioned.
21	Blair, B. X., Capt., I, 149th Penn.	July 1, 4, '63.	Left; by Asst. Surg. W. G. Hunter, 149th Penn. Discharged Feb. 5, 1864; pensioned.
22	Blair, C. W., Landsman, U. S. Gunboat Tanah.	April 3, 15, '64.	Left; flap. To Naval Hospital May 15, 1864.
23	Blaisdell, W., Pt., F, 78th New York, age 22.	June 17, 20, '64.	Left; circ.; by Surg. G. P. Oliver, 111th Pa. Disch'd Oct. 28, 1865; pensioned.
24	Bowlin, J. S., Pt., C, 84th Illinois.	Sept. 20, Oct. 6, 1863.	Right; by Surg. A. H. Stephens, 6th Ohio. Discharged February 22, 1864; pensioned.
25	Bramhall, E. H., Serg't, D, 24th Wisconsin.	Sept. 20, 25, '63.	Right; circular. Discharged Feb. 18, 1864; pensioned.
26	Brebner, J., Pt., H, 1st Michigan Cavalry.	Aug. 4, 13, '62.	Left. Discharged March 24, 1863; pensioned.
27	Bresnahan, J., Pt., A, 27th Indiana.	May 3, 9 '63.	Right; by A. Surg. H. Allen, U. S. A. Disch'd Mar. 15, '64; pens'd.
28	Brodrie, J., Pt., K, 9th Illinois.	Feb. 14, 27, '62.	Right; flap. Discharged May 26, 1862; pensioned.
29	Brown, W., Serg't, I, 66th N. Y., age 38.	July 2, 6, '63.	Right; circular; by Surg. L. W. Oakley, 2d N. J. To V. R. C. May 3, '64; pens'd. *Spec.* 1466.
30	Burke, M., Serg't, K, 15th N. Y. Art., age 28.	June 25, July 4, 1864.	Left; circ.; by A. A. Surg. H. M. Dean; (excis'n head of humerus March 29, 1865.)
31	Caldwell, F. B., Pt., A, 17th Infantry, age 20.	Oct. 1, 31, '64.	Left; flap; by Surg. D. W. Bliss, U. S. V. Disc'd Ap. 17, '65; pen'd.
32	Call, G., Pt., C, 3d Iowa.	July 12, 15, '63.	Left. Discharged; pensioned.
33	Cameron, D., Captain, G, 22d New York.	Aug. 30, Sept. 13, 1862.	Right; by A. Surg. J. B. Brinton, U. S. A.; (sec'ry hæmorrhage.) Disch'd June 19, '63. *Spec.* 318.
34	Campbell, G. W., Pt., C, 7th Mo. S. M. Cav.	Oct. 28, No. 12, '62	Right. Discharged March 7, '63; pensioned.
35	Carr, J. L., Pt., D, 116th Penn., age 18.	June 16, July 6, '64	Left; by A. A. Surg. W. W. Valk. To V. R. C. Mar. 3, '65; pens'd.
36	Carson, G. P., Pt., B, 120th N. Y., age 30.	Sept. 23, Oc. 10, '64.	Left; flap; by A. Surg. C. H. Alden, U. S. A. Disch'd May 17, '65.
37	Chandler, G. B., Lieut., D, 16th Michigan.	June 27, July 2, '62	Left. To V. R. C. Aug. 11, '63
38	Chrisman, E., Pt., E, 11th Iowa, age 25.	April 6, 23, '62.	Left; flap; by Dr. J. H. Turner. Disch'd Dec. 2, 1862; pens'd.
39	Clancy, P., Pt., G, 67th New York, age 32.	May 6, 15, '64.	Left; ant.-post. flap. Discharged Dec. 8, 1864; pensioned.
40	Clark, P., Pt., I, 97th Penn., age 24.	Aug. 16, Sept. 15, 1864.	Right; ant.-post. flap; by A. A. Surg. E. B. Woolston. Must'd out Oct. 30, 1865. *Spec.* 3717.
41	*Clemens, R. B.*, Pt., Cootin's Art., age 24.	April 6, 15, '65.	Left; circular; by Surg. G. R. Sullivan. 39th New Jersey. Exchanged May 9, 1865.
42	Comstock, A., Pt., I, 89th Illinois, age 30.	July 3, 24, '64.	Right; circular. Discharged May 30, 1865.
43	Cooper, S., Pt., G, 82d Ohio.	July 1, 5, '63.	Left. Discharged December 23, 1863; pensioned.
44	Cornick, F., Pt., K, 36th Col. Troops, age 22.	Sept. 29, Oct. 19, 1864.	Right; flap; by A. A. Surg. C. C. Ela. Disch'd March 27, 1866; pensioned. *Spec.* 3402.
45	Craig, R. L., Pt., B, 2d Ind. Cav., age 24.	April 2, 10, '65.	Left; circ.; by Surg. J. B. Larkins, 17th Ind. Disch'd Oct. 25, 1865, pensioned.
46	Crampton, W. H., Pt., A, 28th New York.	Aug. 9, 21, '62.	Right; double flap; by Surg. J. E. Summers, U. S. A. Disch'd Sept. 24, '62; pens'd. *Spec.* 45.
47	Creutz, A., Pt., A, 82d Illinois.	July 20, 23, '64.	Left; circular. Disch'd Feb. 24, 1865; pensioned.
48	Crumbo, C., Pt., A, 13th Indiana.	July 11, Au. 5, '61.	Left; by A. Surg. E. S. Dunster, U. S. A. Dis'd Dec. 10, '61; pens'd.
49	Dale, J. W., Serg't, B, 25th Illinois, age 22.	Sept. 20, Oct. 8, '63.	Left; flap; (re-amp. shoulder joint Jan. 16.) Dis'd Sep. 5, '64, pen'd.
50	Davis, A., Serg't, C, 142d Pennsylvania.	July 1, 9, '63.	Left; flap; by Asst. Surg. A. B. Haines, 19th Ind. Disc'd Dec. 18, 1863; pensioned.
51	Davis, J. A., Pt., A, 9th West Virginia.	May 9, 16, '64.	Left; by Surg. J. Morris, 9th W. Va. Dis'd July 20, 1864; pen'd.
52	Day, J., Pt., F, 1st Mass. H. Art., age 30.	Oct. 1, 18, '64.	Right; flap; by A. A. Surg. G. A. Chesley. Dis'd Mar. 23, '65; pen'd.
53	Dempsey, E., Pt., C, 4th Kentucky Cav.	July 10, 13, '62.	Right; by Surg. C. Smith, 9th Mich.; (also fract. left humerus.) Disc'd Jan. 1, 1863; pensioned.
54	Dennerlee, L., Pt., B, 16th Infantry.	Sept. 19, 27, '63.	Left; flap. Discharged Jan. 27, 1864; pensioned.
55	Denning, W. B., Pt., F, 93d Ohio.	Nov. 25, 28, '63.	Right; by Surg. J. L. Teed, U. S. V. Disch'd Feb. 26, '64; pens'd.
56	Deweese, S., Pt., D, 33d Iowa, age 18.	April 30, M'y 17, '64	Flap. Disch'd March 21, 1865.
57	Dillon, G., Pt., D, 125th Illinois.	June 2, 21, '64.	Right; circ.; by A. A. Surg. M. I. Franklin. Disch'd Jan. 27, '65; pensioned.
58	Dobson, J., Pt., A, 39th Illinois, age 40.	May 20, 24, '64.	Right; circ.; by Asst. Surg. H. C. Roberts, U. S. V. Disch'd Nov. 3, 1864; pensioned.
59	Doyle, F., Capt., G, 84th New York.	Aug. 29, Sep. 4, '62	Circ.; by Surg. E. Bentley, U. S. V. Disch'd Oct. 28, 1862.
60	Duffy, H., Lieut., D, 155th New York, age 46.	June 3, 21, '64.	Left; circ.; by Surg. D. W. Bliss, U. S. V.; (hæmorrhage; lig. brachial June 13.) Disch'd Oct. 11, 1864; pensioned.
61	Dunlap, A. P., Pt., D, 21st New York.	Aug. 30, Se. 15, '62.	Right; by Surg. D. W. Bliss, U. S. V. Disch'd Oct. 22, '62; pen'd.
62	Dunlap, E., Pt., C, 1st Maryland, age 21.	May 8, 22, '64.	Left; Discharged Feb. 1, 1865; pensioned.
63	Dunn, C., Pt., L, 5th Mich. Cav., age 27.	Nov. 12, 20, '64.	Right; flap; by A. Surg. H. B. Noble, 2d O. Cav. Dis'd Apr. 21, '65.
64	Elliott, J. F., Pt., I, 8th Indiana.	May 22, 27, '63.	Right; flap; by Surg. J. K. Bigelow, 8th Ind. Disch'd Nov. 28, 1863; pensioned.
65	Emerson, W. A., Pt., H, 16th Mass., age 25.	June 30, July 19, 1862.	Lat. flap; by Surg. R. H. Coolidge, U. S. A. Disch'd Sept. 9, 1862. *Spec.* 26.
66	Evans, J. M., Pt., D, 82d Penn., age 36.	June 1, 16, '64.	Right; circ.; by A. A. Surg. C. Ewen. Dis'd Nov. 10, '64; pen'd.
67	Farnum, E. P., Pt., B, 132d Pennsylvania.	Sept. 17, 26, '62.	Right; circ.; by Surg. G. Grant, U. S. V. Dis'd Dec. 20, '62; pensioned. Died Aug. 14, 1871.
68	Farrell, J., Pt., B, 10th New York Cav., age 22.	July 31, Au. 24, '64	Left; flap; by A. A. Surg. E. A. Page. Disch'd Jan. 3, '65; pen'd.
69	Farrell, J., Serg't, I, 15th N. Y. Engineers.	Dec. 11, 26, '62.	Left; by Surg. D. W. Bliss, U. S. V. Duty June 16, 1863; pens'd.
70	Farrell, W. A., Pt., F, 36th New York.	July 1, 12, '62.	Left; flap; by A. A. Surg. J. R. Uhler. Dis'd Aug. 19, '62; pens'd.
71	Finlay, J., Pt., C, 3d Mass. Battery, age 22.	Aug. 18, Sept. 1, 1864.	Right; circ.; by A. A. Surg. J. P. Agnew; (prim'y amp. forearm.) Recov'd Nov. 26, '64; pensioned.
72	Finney, P., Pt., A, 7th Wisconsin.	Aug. 28, Se. 25, '62.	Right; by A. A. Surg. J. H. Smith. Disch'd Nov. 19, '62; pensioned.
73	Flahirn, L., Pt., B, 7th N. Hampshire, age 34.	Feb. 20, Mar. 17, 1864.	Left; circ.; by A. A. Surg. J. F. Kennedy. Discharged June 27, 1864; pensioned. *Spec.* 2808.
74	Fox, W. H., Pt., H, 7th Ohio, age 22.	May 3, 14, '63.	Right; ant.-post. flap; by Surg. H. Bryant, U. S. V. Disch'd Nov. 20, 1863; pensioned. *Spec.* 1106.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
75	Freyer, J., Pt., L.3d New Jersey Cavalry, age 43.	Aug. 20, Se. 15,'64.	Left; flap. Discharged Oct. 21, 1865; pensioned.
76	Frost, D., Pt., B, 8th Michigan, age 24.	May 6, 27, '64.	Left; circular; by Asst. Surg. A. Delancy, U. S. V. Discharged Sept. 12, 1864; pensioned.
77	Furnish, J., Pt., F, 34th Indiana, age 25.	Jan. 7, Feb. 5,'64.	Left; circular; by A. A. Surg. F. Hassenberg. Disch'd Mar.10,'64.
78	Gardiner, G. R., Corp'l, C, 48th New York.	July 18, 21, '63.	Right; flap. Discharged November 14, 1863.
79	Gaskell, E. C., Lieut., C, 36th C. T., age 20.	Sept. 29, Oct. 3,'64.	Left; flap; by A. A. Surg. W. F. Litch. Duty April 8,'65; pens'd.
80	Gaunt, T. M., Pt., E, 22d Indiana.	De.31,'62, Jan.4,'63.	Right; flap. Discharged Sept. 10, 1863.
81	*Gibson, D. C.*, Pt., I, 31st Virginia, age 24.	July 20, 26, '64.	Left; circ.; by Surg. J. B. Lewis, U.S.V. Pro. Mar'l Nov. 1, 1864.
82	Gibson, R. H., Corp'l. F, 21st Michigan, age 22.	Sept. 20, Oct. 1,'63.	Left; by A. A. Surg. H. M. Lilly. Disch'd April 6, '64; pensioned.
83	Gildersleeve, J., Pt., G, 79th New York.	July 21, Au. 11,'61	Right; flap; by Asst. Surg. A. McLetchie, 79th N.Y. Dis'd; pens'd.
84	Gorton, F., Pt., A, 1st Penn. Rifles.	June 30, Jul.10,'62	Right; flap; by A. A. Surg. T. B. Castle. Dis'd Oct. 1,'62; pens'd.
85	Green, S. H., Pt., E, 2d U. S. S. S., age 28.	Oct. 27, No. 14,'64	Right; circular. Disch'd July 16, 1865; pensioned.
86	Gregg, W., Pt., I, 2d Conn. Art., age 23.	June 1, 12, '64.	Right; by Surg. D. W. Bliss, U. S. V. Dis'd Aug. 21,'64; pens'd.
87	Guerrin, J. E., Pt., C, 113th Illinois.	June 10, 14, '64.	Left; flap; by A. A. Surg. R. W. Coale; hæmorrhage. Discharged Sept. 9, 1864; pensioned.
88	Hanese, J., Pt., E, 16th Michigan, age 19.	July 30, Aug. 22, 1864.	Right circ.; by A.A. Surg. A. N. Brockway. Discharged Sept. 14, 1865; pensioned.
89	Harper, W., Lieut., A, 43d Indiana.	April 30, M'y 3,'64.	Left; by Surg. Swindell, C. S. A. Disch'd June 14, 1865; pens'd.
90	Harris, J., Pt., B, 72d Pennsylvania.	June 29, July 13, 1862.	Left; by A.Surg. T.H.Helsby, U. S. A. Disch'd Sept. 13, 1862; pensioned.
91	Hart, H., Pt., A, 16th Infantry.	Aug. 17, 23, '64.	Right; flap; by A. A. Surg. T. Thompson. Discharged May 15, 1865; pensioned.
92	Hartnett, D., Pt., I, 185th New York, age 22.	Mar. 29, Apl.4,'65.	Left; circ.; by A. Surg. H. Allen, U. S. A. Disch'd July 3, 1865; pensioned. *Spec.* 154.
93	Hartwell, F. E., Pt., C, 10th Mass., age 21.	May 5, 10, '64.	Left; flap; by Surg. D. W. Bliss, U.S.V. Dis'd July 20,'64; pen'd.

201	Smith, J. M., Pt., E, 12th Connecticut, age 47.	Sept. 19, Oct. 6, '64.	Left; circular; by A. A. Surg. J. M. Boisnol. Dis'd April 20, '65.
202	Spaulding, S., Pt., F, 100th Illinois, age 21.	Aug. 5, 11, '64.	Left; circular; by A. Surg. E. B. Glick, 40th Ind. Dis'd Jan. 2, '65.
203	Sprague, C., Pt., A, 4th Art., age 28.	July 3, 7, '63.	Left; by Surg. C. S. Wood, 66th N. Y. Disch'd Oct. 12, '63; pens'd.
204	Stager, J., Corp'l, E, 95th Pennsylvania.	May 2, 9, '63.	Left; flap; A. Surg. W. Thomson, Disch'd Sept. 9, 1863; pens'd.
205	Stover, N. W., Pt., D, 5th Maine.	June 27, 30, '62.	Right; ant.-post. flap; by Surg. G. E. Brickett, 21st Maine. Discharged Sept. 2, 1862; pens'd.
206	Sullivan, J., Pt., E, 15th Mass., age 19.	Sept. 17, 23, '62.	Left; flap. Discharged December 18, 1862; pensioned.
207	Sweeney, J., Pt., D, 69th New York.	June 1, 4, '62.	Right; flap. Discharged August 22, 1862; pensioned.
208	Thayer, L., Serg't, H, 1st Ohio Cav.	Aug. 25, Sep. 6, '64.	Left; flap. Duty January 28, 1865.
209	Theobald, V., Corp'l, D, 44th Ill., age 29.	June 27, July 3, 1864.	Right; circular; by A. Surg. C. C. Byrne, U. S. A. Disch'd March 14, 1865; pensioned.
210	Thomas, G. W., Pt., D, 24th Mass., age 20.	Aug. 16, 27, '64.	Right; flap; by Asst. Surg. J. H. Frantz, U. S. A. Disch'd May 31, '65; pens'd. *Spec.* 2544.
211	Thomas, R., Pt., B, 14th New York.	July 1, 26, '62.	Right; circ.; by A. A. Surg. C. P. Russell. Disch'd April 29, '63.
212	Timme, E., Pt., C, 1st Wisconsin, age 22.	Sept. 19, 23, '63.	Left; circ.; by Surg. P. J. A. Cleary, U. S. V. Pens'd May 6, 1864.
213	Tobin, T., Pt., A, 23d Penn., age 24.	June 23, July 9, '64	Left; flap; by Surg. A. H. Thurston, U. S. V. Disch'd May 14, 1865; pensioned.
214	Trask, J. R., Pt., D, 21st Ohio, age 31.	Mar. 24, 28, '65.	Left; by Surgs. Pearson & Wilson, C. S. A. Duty May 5, '65; pens'd.
215	*Turpin, L. R.*, Lieut., G, 34th Va., age 35.	April 6, 19, '65.	Right; circ; by A. Surg. W. Carroll, U. S. V. Released June 6, 1865. *Spec.* 4166.
216	*Tuttle, I. G.*, Pt., D, 52d N. C., age 23.	July 3, 15, '63.	Right; circular. Furloughed October 5, 1863.
217	Twombley, J., Pt., D, 12th N. H.	May 3, 17, '63.	Left; by Surg. H. F. Lyster, 5th Mich. Disch'd Oct. 24, '63; pens'd.
218	Vancellette, T., Pt., D, 3d Vt., age 21.	April 16, 25, '62.	Left; by Surg. R. B. Bontecou, U. S. V.; (lig. axillary April 23, '62.) Disch'd Jan. 13, 1863; pens'd.
219	Van Steinburgh, B., Pt., A, 24th Iowa.	May 16, 30, '63.	Right. Discharged March 29, 1864; pensioned.
220	Vantine, A. C., Corp'l, B, 123d Ohio, age 23.	Sept. 22. Oct. 12, '64	Right; flap; by A. A. Surg. F. Etter; hæmorrhage Oct. 16, '64. Disch'd Feb. 21, 65; pens'd.
221	Veistel, C., Pt., C, 119th New York, age 20.	May 2, 10, '63.	Left; flap. Discharged Sept. 5, 1865; pensioned.
222	Vignos, A., Captain, H, 107th Ohio.	July 1, 4, '63.	Right; by A. Surg. E. M. Wilson, 25th O. Dis'd Sep. 30, '64; pen'd.
223	Walrod, H., Pt., B, 55th Illinois.	April 6, 12, '62.	Right; flap. Discharged June 25, 1862; pensioned.
224	Walter, H. C., Pt., D, 23d Ohio.	May 9, 13, '64.	Left. Discharged March 22, '65; pensioned.
225	Watson, L., Corp'l, G, 87th Pennsylvania.	June 17, July 1, '64	Right; by Dr. H. P. P. Yeates. Discharged February 8, 1865.
226	Weeks, M., Pt, G, 3d Ohio Cav., age 23.	April 2, 6, '65.	Left; circ.; by Surg. W. W. Bickett, 3d O. C. Dis'd Aug. 16, '65; pen'd.
227	Welch, M., Pt., D, 51st New York, age 21.	Sept. 30, Oct. 15, 1864.	Left; flap; by Asst. Surg. W. S. Tremaine, U. S. V. Disch'd July 24, 1865; pensioned.
228	Weston, J. D., Pt., I, 84th New York.	July 1, 10, '63.	Left; by Surg. J. W. Rawlins, 88th Pa. Disch'd Oct. 25, '63; pens'd.
229	Whalen, T., Pt., D, 88th New York, age 63.	June 5, 16, '64.	Left; ant.-post. flap; by Surg. A. F. Sheldon, U. S. V.; (exc. ulna June 12;) recovered Nov. 22, '64. Died May 29, '65, cancer of liver.
230	*White, A. K.*, Capt., F, 21st South Carolina.	July 10, 15, '63.	Left; circular. Exchanged July 31, 1863.
231	White, M., Pt., E, 88th Colored Troops.	Feb. 20, Mar. 10, 1865.	Left; ant.-post. flap; by Surg. F. E. Piquette, 86th C. T. Disch'd May 28, 1865.
232	Whytal, J., Pt., C, 5th New York.	Aug. 30, Sep. 4, '62.	Right. Discharged Dec. 7, 1862; pensioned.
233	Wiley, F. A., Pt., A, 4th Cavalry, age 25.	Aug. 20, Sept. 13, 1864.	Right; circ.; by Asst. Surg. T. A. McGraw, U. S. V.; hæm'ge Sept. 13. Dis'd May 23, '65; pensioned.
234	Willard, J. S., Pt., M, 2d Iowa Cav., age 18.	Aug. 5, 16, '64.	Left; flap; by A. A. Surg. J. Z. Hall. Disch'd Jan. 27, '65; pensioned.
235	Williamson, H. C., Corp'l, D, 90th Ohio, age 21.	De. 16, '64, Jan. 9, '65.	Right; ant.-post. flap; by A. A. Surg. A. Rolls. Dis'd June 12, '65.
236	Woods, E. D., Corp'l, K, 25th Indiana, age 27.	Oct. 15, Nov. 4, 1864.	Right; circ.; by Surg. E. P. Buell, 80th Ohio; (excision October 16.) Disch'd May 8, 1865; pensioned.
237	Worthin, E., Pt., H, 27th Illinois.	De. 31, '62, Ja. 28, '63.	Right; by a Confederate Surgeon. Disch'd May 19, 1863; pens'd.
238	Zafoot, M., Pt., I, 155th Pennsylvania.	Sept. 30, Oct. 28, '64	Left; circ.; by A. A. Surg. H. M. Dean. Disc'd July 20, '65; pen'd.
239	Zimmerman, C., Serg't, H, 6th Conn., age 30.	Aug. 14, 21, '64.	Left; flap; by A. A. Surg. W. Hetts; (excision Aug. 14.) Discharged November 18, 1864; pensioned.

Of this series of two hundred and thirty-nine recoveries after intermediary amputation at the upper third of the arm, one hundred and thirty-two were operations on the left, and one hundred and seven on the right extremity. Thirteen patients were returned to modified duty, three paroled, one furloughed, four exchanged, and two hundred and eighteen discharged, and, with few exceptions, pensioned. The injuries were inflicted by large projectiles in fifteen cases. In twenty-one instances, antecedent operations had been practised: Excisions in the continuity of the humerus, in nine cases; at the elbow joint, in two cases; in the continuity of the radius or ulna, in two cases; ligation of the brachial or axillary, in two cases; removal of large fragments of bone, in three cases; amputation at the elbow, in one case. In six instances, consecutive operations were performed: Exarticulation at the shoulder in three cases, ligations of minor arteries in two cases, extraction of ball from latissimus dorsi in one case. Secondary hæmorrhage occurred in sixteen cases, gangrene in twelve cases, and erysipelas in seven cases. The operations are described as practised by flap methods in ninety-five cases, by circular or oval incisions in seventy cases. Four of the pensioners are reported to have died, after discharge, from phthisis, cancer, or other affections unconnected with the operations. Most of the pensioners have been heard from at the expiration of ten years, through applications for the renewal of artificial limbs or commutation thereof.

§ *Fatal Cases.*—One hundred and eight cases of intermediary amputations at the upper third of the arm for the effects of shot injury resulted fatally. The operations were practised on ninety-eight Union and ten Confederate soldiers,—for lesions due to wounds inflicted by cannon balls in three instances, to the premature explosion of a cannon in one case, and to injuries from small projectiles in one hundred and four instances. The cases were complicated by injuries in other regions in ten instances, and in twenty-four instances[1] there had been antecedent operations. Two of the cases were further complicated by synchronous operations elsewhere,—a Pirogoff amputation, and a partial excision of the lower maxilla. One patient submitted to a secondary re-amputation at the joint; another to a re-amputation very close to the joint, and ligation of the subclavian; and another to ligation of the subclavian. The axillary was tied consecutively in one case, the brachial in two, and the superior profunda in two. The operations were practised on the right arm in fifty-nine, on the left in forty-three cases—this point being unnoted in six. In eighty-three cases in which the mode of operation was mentioned, circular incision was employed in thirty-eight, and the flap in forty-five. Although secondary hæmorrhage and gangrene contributed largely to the fatality, the mortality appears to have been mainly due to pyæmia and other forms of septic infections.[2]

The formidable extent to which the cases of this series were complicated by gangrene and secondary hæmorrhage is very impressive. These conditions are recorded as the proximate causes of death in seventeen cases; but they supervened in many other cases in which the immediate causes of fatality was described in other terms. Thus, there were eighteen cases in which gangrene occurred, and no less than forty-four complicated by consecutive hæmorrhage. Five cases were characterized also by the invasion of erysipelas.

[1] In seven cases there had been antecedent excisions in the shaft of the humerus; in five, of the elbow joint; in two, amputations of the forearm; in three cases, amputations of several fingers or portions of the metacarpus; in six (including one of the cases of excisions in the shaft of the humerus), ligations of the brachial; in two, removal of bone fragments and ball.

[2] The proximate causes of death were reported in ninety-one of the hundred and eight cases, as follows: Shock of operation, 1; tetanus, 2; chronic diarrhœa or dysentery, 6; gastro-enteritis, 1; secondary hæmorrhage, 12; gangrene, 5; erysipelas, 2; pyæmia, 31; ichoræmia, 1; surgical fever, 1; typhoid fever, 4; fever, with jaundice, 1; anasarca, 1; exhaustion, 15; pneumonia, 5; phthisis, 2; hectic fever, 1.

The clinical histories of many of the fatal cases of intermediary amputations of the arm were accompanied by reports of autopsies.[1]

A considerable proportion of the fatal intermediary amputations, a group of cases that were usually treated in general hospitals, supplied the Museum with pathological preparations, consisting for the most part of portions of the shattered humeral diaphyses, exhibiting comminutions in great variety and in various stages of reparation or disorganization.

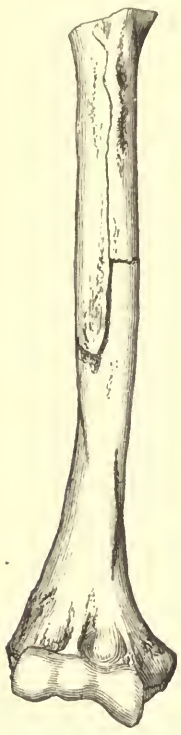

FIG. 533.—Longitudinal shot fissuring of right humerus. *Spec.* 160.

CASE 1674.—Private L. F. Spragg, Co. H, 100th Pennsylvania, was wounded in the right arm, at Chantilly, September 1, 1862. Assistant Surgeon W. Webster, U. S. A., forwarded the specimen (FIG. 533), with the following history by Medical Cadet S. F. Kingston: "The patient was brought to Douglas Hospital on September 8th. The ball entered about two inches below the head of the humerus on the outside, passed downward and inward, fracturing the bone, and passed out just above the inner condyle of the humerus. His wound appeared to get along finely, up to the 20th of September, when it began to bleed from the brachial artery, at which time Dr. Webster, in charge of the hospital, found it necessary to amputate. But, owing to the amount of blood lost (sixty ounces) and the great degree of nervous prostration, the patient survived the operation but a short time." The specimen consists of "the right humerus, amputated at the surgical neck. In the middle third a transverse-oblique fracture connects with a longitudinal fissure of three and a half inches on the external surface of the upper portion of the shaft. There is no attempt at repair, and but a minute trace of necrosis at what appears to be the point of impingement on the posterior surface of the bone."—(*Cat. Surg. Sec.*, 1866, p. 129.)

Specimens of injured bones in this series, which are twenty-six in number, sometimes exhibit slight attempts at reparation, but are more generally characterized by the effects of destructive inflammatory action and often by extended caries and necrosis.

CASE 1675.—Private A. Duchene, Co. A, 11th Indiana, age 23 years, was wounded at Champion Hills, May 16, 1863. He was treated at a field hospital until June 10th, when he was received on board of the hospital steamer City of Memphis for transfer to General Hospital. Assistant Surgeon H. M. Sprague, U. S. A., forwarded the specimen (FIG. 534), consisting of the shaft of the right humerus, amputated in the upper third by circular method, on June 12th, by Acting Assistant Surgeon L. Darling. The specimen shows a badly comminuted fracture in the middle third, with a trivial amount of callus deposited upon the fragments, the borders of which are necrosed. Two days after the operation the patient reached the Washington Hospital, at Memphis, where he died on July 5, 1863.

FIG. 534.—Shot comminution of right humerus four weeks after injury *Spec.* 1634. ½

TABLE LXXVII.

Summary of One Hundred and Eight Fatal Cases of Intermediary Amputations in the Upper Third of the Shaft of the Humerus.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Allen, C. M., Pt., K, 109th N. Y., age 25.	April 2, 18, '65.	Left; ant.-post. flap; by A. A. Surg. T. H. Getchell. Died Ap. 21, '65.	7	Brickell, E., Pt., A, 7th Mich. Cav., age 19.	July 2, 6, '63.	Right: flap; hæmr'ge—ligation. Died August 10, 1863, pyæmia.
2	Archer, H., Pt., H, 14th N. Y. S. M., age 23.	May 8, 13, '64.	Right; ant.-post. flap; by Surg. A. F. Sheldon, U. S. V. Died May 30, 1864, pneumonia.	8	Burke, J., Pt., H, 6th Penn. Cav., age 20.	May 8, June 4, 1864.	Left; by A. Surg. W. F. Norris, U. S. A.; (exc. May 9; hæm. May 27.) Died June 5, '64, pyæmia. *Spec.* 3550.
3	*Bain, J. W.*, Pt., Shanks' Cavalry, age 23.	Oct. 23, 31, '64.	Right; flap; by Surg. G. W. Hogeboom, U. S. V. Died November 6, 1864, typhoid fever.	9	Burnett, B., Pt., B, 89th Ohio.	Sept. 19, 29, '63.	Right; circ.; by A. Surg. C. F. Haynes, U. S. V. Died Oct. 10, 1863, traumatic pneumonia.
4	Barton, J., Pt., A, 2d Rhode Island, age 18.	Sept. 19, 27, '64.	Right; flap; by A. A. Surg. E. A. Page. Died Sept. 27, '64, exh'n.	10	Burnham, T., Corp'l, K, 42d New York.	May 10, 20, '64.	Left; by Surg. W. J. Brown, 42d N. Y. Died June 4, '64, pyæmia.
5	Blakely, A., Pt., I, 3d Michigan Cav.	June 16, July 10, 1863.	Left; by A. A. Surg. A. Claude; hæm.; gang.; re-amp. sh. joint July 24. Died July 26, 1863.	11	Burton, L. G., Pt., F, 14th Conn., age 50.	May 6, 27, '64.	Right: circ.; by Dr. Nelson. Died June 18, '64. *Spec.* 2473.
6	Bowers, C., Pt., A, 8th N. Y. H. A., age 19.	July 9, 19, '64.	Right; flap; by Surg. G. S. Palmer, U. S. V. Died July 26, '64, exhaustion.	12	*Chambler, J. L.*, Pt., B, 36th Alabama, age 19.	April 8, 14, '65.	Left; ant.-posterior flap; by A. A. Surg. H. B. Cole. Died June 13, 1865, chronic diarrhœa.

[1] I am compelled by want of space to omit the interesting reports of autopsies in many cases of this series, made by Acting Assistant Surgeons M. Baldwin, O. P. Sweet, J. Prieto, J. S. Wents, S. B. Harris, D. McDill, S. O. French, S. P. Bigelow, and Assistant Surgeon S. H. Orton, U. S. A. They contain many valuable descriptions of the local conditions and remote visceral complications observed, and merit careful study in the light of the accompanying detailed clinical histories. I hope to revert to them in the Chapter on Pyæmia, in the *Third Surgical Volume;* but, in the meantime, the student must be referred to the manuscript files of this Office.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
13	Clapsaddle, G., Pt., G, 84th Indiana, age 24.	Sept. 20, 25, '63.	Right. Died October 21, 1863, pyæmia.
14	Cline, C. R., Pt., D, 7th West Virginia, age 21.	June 1, 23, '64.	Right; flap; by A. A. Surg. H. D. Vesburg. Died June 25, 1864, exhaustion.
15	Cole, A., Pt., D, 18th Massachusetts, age 35.	De.13,'62. Ja. 1, '63.	Left; flap; by A. A. Surg. J. W. Digby. Died Jan. 16,'63, dropsy.
16	Cook, G. A., Pt., G, 65th Pennsylvania.	May 31, June 28, 1862.	Right; circular; by A. A. Surg. D. W. Cheever. Died July 4, 1862, pyæmia. *Spec.* 16.
17	Cook, J., Pt., D, 1st Me. Heavy Art., age 39.	June 17, Jul. 7,'64.	Left; ant.-posterior flap; by A. A. Surg. W. W. Valk. Died July 16, 1864, pyæmia.
18	Cramer, S., Pt., E, 45th Pennsylvania, age 32.	June 3, 30, '64.	Right; circular; by A. A. Surg. B. B. Miles. Died July 6, 1864.
19	Cronkhite, L., Pt., E, 86th Indiana, age 22.	June 27, Jul. 12,'64	Left; circ.; by A. A. Surg. F. C. Leber. Died Aug. 8,'64, pyæmia.
20	Deiter, L., Pt., E, 9th Michigan.	May 23, June 6, 1865.	Left; ant.-posterior flap; by A. A. Surg. J. D. Skeer. Died June 14, 1865, irritative fever.
21	*Delaney, M.*, Pt., G, 27th North Carolina.	May 5, 15, '64.	Right; circular; hæmorrhage. Died May 29, 1864, pyæmia.
22	Duchene, A., Pt., A, 11th Indiana, age 23.	May 16, June 12, 1863.	Right; circular; by A. A. Surg. L. Darling. Died July 5, 1863. *Spec.* 1634.
23	Elliott, W. H., Pt., A, 109th Penn., age 18.	Oct. 28, Nov. 4,'63	Left; circular. Died November 15, 1863, ichoræmia.
24	Faulkner, S., Pt., F, 63d New York, age 30.	June 16, 24, '64.	Right; flap. Died July 12, 1864, pyæmia.
25	Fish, C., Pt., A, 15th Maine, age 26.	April 8, 15, '64.	Right; circ.; by Surgs. B. Wilson, U. S. V., and M. D. Benedict, 75th N. Y. Died May 18,'64, pneum.
26	Forster, C. A., Pt., C, 11th Vt., age 22.	July 1, 8, '64.	Circ.; by A. A. Surg. F. D. Weisse. Died July 28, 1864, pyæmia.
27	Fowler, W. W., Corp'l, F, 67th N. Y., age 23.	May 6, 10, '64.	Right; by Surg. G. T. Stevens, 77th N. Y.; gangrene. Died June 7, 1864, typhoid fever.
28	Frank, J., Pt., K, 33d Indiana, age 22.	May 25, June 17, 1864.	Left; flap; by Asst. Surg. C. C. Byrne, U. S. A.; gangrene. Died June 21, 1864, pyæmia.
29	Fulton, G. E., Pt., C, 4th Vt., age 26.	July 7, 20, '64.	Left; circ.; by A. A. Surg. A. N. Brockway; (exc. July 7; hæm.) Died Feb. 6, '65, ch. diarrhœa.
30	Gabele, E. R., Pt., I, 3d Michigan.	June 1, 12, '62.	Right; flap; by A. A. Surg. J. D. Draper; hæm. Died June 24,'62.
31	Gleason, M., Pt., A, 1st Michigan, age 22.	June 18, 29, '64.	Right; circ.; by A. A. Surg. W. Badger. Died June 29, 1864, hæmorrhage.
32	*Gregory, J.*, Pt., D, 6th Virginia, age 28.	July 30, Au. 15, 64	Right; circ.; by Surg. I. P. Smith, U. S. A.; hæm. Died Aug. 21,'64.
33	Gutberlet, F., Pt., K, 27th Mass., age 26	June 3, 9, '64.	Right; flap; by Surg. D. P. Smith, U. S. V.; (exc. el. joint June 3; hæmorrhage.) Died July 6, '64, pyæmia. *Spec.* 2015.
34	Harris, J. D., Pt., K, 33d Mass., age 26.	Oct. 30, Nov. 13, 1863.	Left; circ; by A. A. Surg. D. McDill. Died November 28, 1863, pyæmia. *Spec.* 1927.
35	Haxton, T., Pt., H, 86th New York.	Aug. 30, Sept., '62.	Right. Died September 24, '62, typhoid fever.
36	Hendrix, W. A., Pt., G, 33d Ohio, age 19.	July 21, Aug. 3,'64	Left; by A. A. Surg. J. A. Hall. Died August 18,'64, pneumonia.
37	Henniker, C., Pt., H, 12th Infantry, age 23.	June 1, 21, '64.	Left; circ.; by A. A. Surg. A. W. K. Andrews; (amp. finger June 11.) Died June 23, '64, gangrene.
38	Hollis, P. A., Pt., H, 20th Kentucky, age 20.	Aug. 26, Se. 23,'64.	Left; circ; by A. A. Surg C. S. Merrill. Died Sept. 26, '64, pyæmia.
39	Hood, F. A., Corp'l, F, 40th Mass., age 39.	June 3, 26, '64.	Left; by A. A. Surg. A. V. Cherbonnier; (amp. of forearm June 16; erysipelas; hæmorrhage.) Died June 27, 1864.
40	Jess, W., Pt., F, 125th Illinois, age 21.	June 27, July 24, 1864.	Left; circ.; by Surg. S. E. Fuller, U. S. V. Died August 31, 1864, chronic diarrhœa.
41	Johnson, J. J., Corp'l, K, 48th New York, age 26.	June 3, 27, '64.	Left; ant.-posterior flap; by A. A. Surg. J. A. Bates; (exc. June 22; gangrene; hæm'ge.) Died June 29, '64, exhaustion. *Spec.* 3042.
42	*Kane, J. F.*, Pt., D, 27th Georgia.	June 1, 16, '64.	Left, circ.; by Surg C. B. Gibson, C. S. A. Died June 16, 1864, hæmorrhage.
43	*Keeter, J.*, Pt., G, 14th Virginia, age 47.	May 10, 27, '64.	Right; flap. Died June 24, 1864. Complicated by a wound of lung.
44	Kenedy, J., Pt., C, 47th Indiana.	April 7, 17, '64.	Right; circ.; by Asst. Surg. S. H. Orton, U. S. A.; (icterus from contus. of liver.) Died April 27, '64.
45	Kreman, J., Pt., A, 10th Infantry, age 40.	Sept. 30, Oct. 14, 1864.	Left; flap; by Surg G. S. Palmer, U. S. V. Died November 27, 1864, exhaustion.
46	Lambkin, R. A., Pt., I, 2d Michigan Cavalry.	Mar. 5, 26, '63.	Right. Died March 29, 1863.
47	Lambur, J., Pt., B, 183d Ohio, age 16.	Nov. 30, Dec. 4, 1864.	Left; flap; by A. A. Surg, S. T. Williams. Died Dec. 8, 1864, pyæmia.
48	L'Aimée, A. B., Pt., G, 51st New York, age 21.	Mar. 14, 21, '62.	Right; circular; by Surg. G. A. Otis, 27th Mass.; (lig. subclav.) Died April 15, 1862, pyæmia.
49	*Love, J. E.*, Capt., A, 5th Texas, age 19.	July 2, 6, '63.	Right; circ.; by A. Surg. E. D. Ereneman, U. S. A.; (re-amp. August 15; hæmorrhage.) Died Aug. 22,'63, exhaust n. *Spec.* 1522.
50	Magagan, G., Pt., G, 61st Ohio, age 17.	July 20, Aug. 11, 1864.	Right; ant.-post. flap; by A. A. Surg. L. E. Tracy. Died Sept. 20, 1864, pyæmia.
51	Marshall, H., Pt., E, 1st Mich. Cav., age 20.	May 28, June 24, 1864.	Right; flap; by A. A. Surg. S. B. Harris; (hæmorrhage.) Died July 11,'64, pyæmia. *Spec.* 2877.
52	Marshall, T., Pt., F, 96th Penn., age 20.	May 10, June 6, 1864.	Left; flap; by A. A. Surg. M. F. Price. Died June 22, 1864, abscess (metastatic) in lung.
53	McDermott, P., Serg't, D, 81st Penn., age 25.	Dec. 13, Dec., '62.	Left; flap; by A. A. Surg. G. A. Chesley. Died July 8, 1864, typhoid fever.
54	McNeil, W. R., Pt., D, 40th Pennsylvania.	Aug. 30, Sept., '62.	Left. Died October 26, 1862.
55	Merveille, A., Pt., G, 5th Ohio.	July 3, 10, '63.	Right; by Surg. H. E. Goodman, 28th Pa.; (exc. July 4; gangrene.) Died July 13, 1863, pneumonia.
56	Monroe, M. V., Pt., E, 18th Indiana, age 24.	Sept. 19, Oct. 3, 1864.	Right; flap; by A. A. Surg. W. P. Moon. Died October 14, 1864, exhaustion. *Spec.* 3113.
57	Moore, M., Pt., A, 68th Col'd Troops, age 30.	July 15, 24, '64.	Right; flap; by A. A. Surg. J. Prieto; gang. Died July 28 '64.
58	Morgan, W. F., Pt., A, 16th Kentucky, age 19.	Nov. 30, Dec. 13, 1864.	Left; circ.; by A. A. Surg. E. H. Oney; gangrene. Died Dec. 23, 1864, pyæmia.
59	Munford, A. M., Corp'l, A, 80th Indiana.	May 14, June 7, 1864.	Right; circ.; by Asst. Surg. B. E. Fryer, U. S. A. Died June 10, 1864, chronic dysentery.
60	Musgrove, W. H., Pt., K, 49th Ohio.	De.31,'62, Ja. 17,'63.	Left. Died February 3, 1863, wound and rheumatism.
61	Nelson, R., Pt., H, 11th New Jersey, age 18.	July 1, 23, '64.	By A. A. Surg. F. D. Weisse. Died August 31, 1864, pyæmia.
62	*Newell, E. F.*, Pt., E, 31st Georgia, age 27.	May 5, 18, '64.	Right; lateral flap. Died May 28, 1864, pyæmia.
63	O'Donell, M., Pt., Ayres' Battery, age 22.	April 16, 21, '62.	By Surg. R. B. Bontecou, U. S. V. Died April 30, 1862, tetanus.
64	Palmer, U., Pt., B, 4th Artillery.	July 1, 12, '63.	Left; (hæmorrhages — ligation.) Died July 21, 1863.
65	Pew, E. B., Pt., B, 3d New Jersey, age 24.	May 5, 20, '64.	Right; ant.-post. skin flap; by A. Surg. A. Delancy, U. S. V. Died May 20, 1864, shock.
66	Phillips, H., Pt., A, 14th Conn., age 36.	Aug. 13, Sept. 10, 1864.	Right; flap; by A. A. Surg. W. H. Ensign; (exc. Aug. 14.) Died Oct. 24, 1864, exh'n. *Spec.* 3248.
67	Pugh, E. D., Pt., B, 2d N. Y. Art., age 40.	May 30, J'e 12,'64.	Left; by A. Surg. H. M. Sprague, U. S. A. Died June 12,'64, tetanus.
68	*Pursell, L. B.*, Pt., 24th Ga. Troops, age 20.	Sept. 17, 23, '62.	Left; circular. Died September 30, 1862, pyæmia.
69	Randall, P. F., Pt., D, 58th Mass., age 27.	May 12, 30, '64.	Circular; by A. A. Surg. J. S. Wents. Died June 7,'64, pyæmia.
70	Rea, J. K., Pt., H, 102d Penn., age 17.	May 5, 17, '64.	Left; flap; by Surg. C. Page, U. S. A.; (gang.; hæm.; lig. brach.) Died Dec. 1, '64, phth. and diar.
71	Reese, W., Pt., B, 115th Illinois.	Sept. 20, 27, '63.	Left; lat. flap; gang.; erysipelas. Died Oct. 12, 1863, gangrene and hæmorrhage.
72	Reynolds, H., Pt., H, 5th New York, age 32.	Aug. 8, Sept. 17, 1864.	Right; circ.; by A. A. Surg. J. R. Agnew; (amp. forearm Aug. 21; necrosis; hæm.) Died Oct. 10, '64.
73	Richards, J. H., Pt., H, 1st Me. Cav., age 34.	June 24, July 15, 1864.	Right; ant.-post. flap; by A. Surg. T. Artaud, U. S. V. Died July 29, '64, pyæmia. *Spec.* 3323.
74	Ricker, B., Pt., G, 6th Vermont, age 45.	May 5, 16, '64.	Left; ant.-post. flap; by Surg. E. Bentley, U. S. V. Died May 22, 1864, gangrene.
75	Ripley, R., Pt., I, 7th Vermont, age 18.	Sept. 10, 14, '63.	Right; (amp. finger Sept. 10; gangrene.) Died Sept. 20, '63.
76	Sanford, C. D., Pt., L, 4th N. Y. H. A., age 18.	May 19, 28, '64.	Right; circ.; by A. A. Surg. O. P. Sweet. Died June 2, '64, gastro-enteritis.
77	Schoneckles, F., Pt., G, 2d Delaware.	Dec. 13, 19, '62.	Right; by Surgs. C. S. Wood, 66th N. Y., and C. Gray, 7th N. Y.; (amp. foot Dec. 19.) Died.
78	Scott, W. H., Capt., D, 1st Ohio Cav., age 25.	Aug. 20, Sept. 17, 1864.	Right; circ.; by A. A. Surg. P. L. Rice; (excision; hæmorrhages.) Died Sept. 27, '64, exhaustion.
79	Shew, A., Pt., A, 72d Penn., age 19.	De.13,'62. Jan. 1, 1863.	Right; double flap; by A. A. Surg. J. W. Digby. Died Jan. 8, 63. *Spec.* 927.
80	Sinclair, F., Pt., B, 8th Maine, age 26.	May 20, June 11, 1864.	Right; double flap; by A. A. Surg. M. Baldwin. Died July 1, '64, pyæmia.
81	Slater, J., Pt., G, 5th Cav., age 46.	May 6, J'e 5,'64.	Right; circ.; by A. A. Surg. J. Newcombe. Died June 15,'64, exh'n.
82	Spellman, F., Serg't, G, 5th New York.	Aug. 30, Sep. 4,'62.	By A. Surg. B. Howard, U. S. A.; (exc. of jaw.) Died Sept. 9, '62.
83	Spragg, L., Pt., H, 100th Pennsylvania.	Sept. 1, 20, '62.	Right; by A. Surg. W. Webster, U. S. A. Died Sept. 20, 1862, hæmorrhage. *Spec.* 160.
84	Stetson, S. M., Pt., B, 32d Maine, age 19.	May 31, June 4, 1864.	Right; circ.; by Surg. T. F. Oakes, 50th Mass.; (hæm.; lig. axillary.) Died June 22, 1864.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
85	Strange, J., Pt., H, 62d New York, age 60.	May 5, June 3, 1864.	Right; circ.; by A. A. Surg. H. M. Dean. Died June 10, 1864, exhaustion. *Spec.* 2426.
86	Sutherland, W. S., Corp'l, D, 6th Maine, age 26.	May 3, 11, '63.	Right; flap. Died May 19, 1863, hæmorrhage. *Specs.* 1079, 1254.
87	Tarby, J., Pt., I, 8th Col'd Troops, age 36.	April 5, 12, '65.	Right; ant.-post. flap; by Asst. Surg. E. McClintock, U. S. V.; (exc. April 5.) Died April 20, '65.
88	Thayer, J., Pt., C, 10th Massachusetts, age 21.	May 3, 26, '63.	Left; circ.; by A. A. Surg. J. P. Wyer; (exc. elb. joint May 18; hæmorrhage.) Died May 27, '63, pyæmia. *Spec.* 1178.
89	Thomas, E., Pt., G, 31st Maine, age 19.	July 30, Aug. 7, 1864.	Left; flap; by Surg. A. F. Sheldon, U. S. V. Died August 13, 1864, exhaustion. *Spec.* 2974.
90	Tucker, A. J., Pt., F, 7th Indiana, age 18.	July 22, Aug. 1, 1864.	Right; circ.; by A. A. Surg. T. H. Van Tagen. Died Sept. 24, 1864, exhaustion. *Spec.* 4725.
91	Van Curen, J., Serg't, H, 21st Iowa.	May 1, 31, '63.	Left; doub. flap; by A. A. Surg. H. H. Littlefield. Died June 18, 1863.
92	Vincent, C., Pt., D, 122d Ohio, age 19.	Nov. 27, Dec. 27, 1863.	Left; ant.-posterior flap; by A. A. Surg. C. P. Bigelow. Died January 6, 1864, sec'y hæmorrhage.
93	Waggner, D. T., Pt., H, 133d Penn., age 19.	Dec. 12, —, '62.	Right; circular; by A. A. Surg. J. Stearns. Died Dec. 25, 1862.
94	Wagner, C., Pt., F, 68th New York.	Aug. 30, Se. 24, '62	Right; by Surg. O. A. Judson, U. S. V. Died Oct. 15, '62. *Spec.* 219.
95	Waldo, P. H., Serg't, B, 1st Mass. Heavy Art'y, age 28.	May 19, June 2, 1864.	Left; circ.; by A. A. Surg. S. O. French. Died June 23, 1864, exhaustion; pleurisy. *Spec.* 2929.
96	Waldo, A., Cerp'l, I, 35th Massachusetts, age 30.	May 19, 25, '64.	By Surg. D. W. Bliss, U. S. V. Died June 7, 1864.
97	*Walker, W.*, Pt., C, 18th Georgia.	Nov. 25, Dec. 10, '63	(Excision November 25; hæmorrhages.) Died Dec. 11, 1863.
98	*Wallace, S. H.*, Pt., B, 3d Arkansas.	July 2, 10, '63.	Left; gangrene in foot extended to abdomen. Died Aug. 20, 1863.
99	Walters, L., Pt., F, 46th New York, age 40.	June 17, July 15, 1864.	Right; circular; by Surg. R. B. Bontecou, U. S. V. Died July 21, 1864, pyæmia.
100	Whaley, W., Serg't, H, 142d Penn., age 30.	July 1, 14, '63.	Right; flap; by A. A. Surg. G. H. Dare; hæmorrhage. Died July 21, 1863, pyæmia.
101	Wilburn, I., Pt., A, 68th Col'd Troops, age 30.	April 2, 13, '65.	Left; circ.; by Surg. F. E. Piquette, 86th C. T.; (exc. April 3.) Died April 28, 1865, hectic fever.
102	*Williams, G.*, Pt., E, 32d Alabama, age 33.	Dc. 31, '62 Jan. 8, '63.	Right. Died January 24, 1863, erysipelas in face.
103	Williamson, J., Corp'l, F, 111th Illinois, age 26.	Dc. 13, '64 Jan. 7, '65.	Right; flap; by A. A. Surg. H. Leaman. Died Feb. 1, '65, pyæ'a.
104	Woods, J., Pt., C., 85th Pennsylvania, age 23.	Sept. 2, 9, '63.	Left; flap; (hæmorrhage from profunda—ligation.) Died September 17, 1863, exhaustion.
105	Wright, D., Pt., G, 9th Colored Troops age 35.	Aug. 16, 28, '64.	Right; flap; by A. A. Surg. W. B. White. Died Sept. 4, 1864.
106	Yates, M., Pt., A, 6th West Virginia, age 23.	May 1, 16, '62.	Right. Died May 23, 1862, pyæmia.
107	Young, P., Pt., A, 19th Kentucky.	May 1, 29, '63.	Left; lateral flap; diarrhœa. Died July 11, 1863.
108	Young, W., Pt., K, 68th Colored Troops, age 29.	April 9, 13, '65.	Left; circular. Died May 2, 1865, diarrhœa.

2. Intermediary Amputations in the Middle Third of the Arm.—Three hundred and forty-eight cases, with a ratio of fatality of 26.7 per cent., were referred to this group. The operations were practised on three hundred and twenty-nine Union and nineteen Confederate soldiers.

§ *Successful Cases.*—Of two hundred and fifty-five patients who recovered from intermediary amputations of the arm in the middle third for lesions consequent on shot injury, twenty-one returned to modified duty, one was sent to an asylum for the insane, fifteen were exchanged or paroled, and two hundred and eighteen were discharged, a large proportion being pensioned. The operations were on the right arm in one hundred and fifteen, and on the left in one hundred and thirty-nine cases, this point being unnoticed in one instance. A few detailed illustrations will be given:

Case 1676.—*D. O'Herron*, a seaman of the Confederate gunboat Ponchartrain, aged 26 years, was wounded in the left arm, at Arkansas Post, January 10, 1863. He was admitted into the City Hospital, St. Louis. Surgeon J. T. Hodgen, U. S. V., reported: "The patient, of healthy sanguine constitution, was admitted on January 22d, having been wounded by a fragment of shell striking the left arm at the lower part of the middle third, causing a very large flesh wound and fracturing the humerus for several inches, also causing a deep flesh wound in the left side. Amputation was performed on the day of admission. January 26th, patient feverish, tongue dry, suppuration weak and watery. A mixture of nitre, gum arabic, tincture of opium, and water was prescribed in doses of a tablespoonful hourly, and warm fomentations (wine and chamomile tea) were applied to the arm; patient kept on low diet. January 29th, wound healthy; suppuration good; appetite fair; bowels regular. The prescription was continued every two hours, simple dressings applied every morning, and nourishing diet and wine were ordered. March 1st, doing well; wound nearly healed. Patient says he still feels a 'buzzing' in the stump. March 27th, patient sent to military prison." The specimen (Fig. 535) was contributed by the operator, Surgeon Hodgen, and consists of "the lower half of the left humerus, with a nearly transverse fracture in the lowest third, complicated by several deep but short fissures."—(*Cat. Surg. Sect.*, 1866, p. 128.)

Fig. 535.—Shell fracture low down in humerus. *Spec.* 1017.

Case 1677.—Lieutenant *B. Anderson*, Co. D, 38th Alabama, aged 39 years, was wounded at Mission Ridge, November 25, 1863. He was admitted into Hospital No. 4, at Chattanooga, and was sent, on January 25th, to the General Field Hospital, where Assistant Surgeon R. Bartholow, U. S. A., recorded: "Gunshot wound of left arm; amputation. Patient transferred on February 26th." On the following day the patient was received into Hospital No. 1, at Nashville, where Acting Assistant Surgeon G. P. Hachenberg reported: "The patient was wounded by a conoidal ball, which produced a partial fracture of the lower third of the humerus. On December 12th, secondary hæmorrhage took place, and the following day the arm was amputated at the junction of the middle and lower thirds. On February 27th, when admitted, the patient was a good deal emaciated and exhausted, laboring under a free purulent discharge from the stump. His appetite was fair and he improved in strength. On March 25th, it was noticed that the end of the bone of the stump was more prominent than usual and appeared to be detached.

On March 27th, a large sequestrum of necrosed bone was removed from the stump by simply seizing hold of it and extracting it." Surgeon C. W. Hornor, U. S. V., reported the man transferred to the Provost Marshal April 26, 1864. The specimen is represented by the figure in the lower right-hand part of PLATE XLVII, opposite, and consists of a sequestrum, five inches in length, from the stump of the left humerus three and a half months after amputation.

CASE 1678.—Private N. Wenning, Co. A, 125th Ohio, aged 38 years, was wounded at Resaca, May 14, 1864, and entered the Chattanooga General Hospital three days afterward, when Surgeon F. Salter, U. S. V., recorded: "Gunshot fracture of arm." On May 19th, the wounded man reached Hospital No. 1, at Nashville, whence Surgeon R. L. Stanford, U. S. V., reported: "The ball entered the external aspect of the left arm about two inches above the elbow joint, making its exit at the opposite side, producing a comminuted fracture of the humerus. When admitted, the soft parts around the elbow were much lacerated and contused, the arm much swollen, and the hand œdematous. The patient's general health was good. The soft parts were so much contused as to render resection unjustifiable, and in consequence of the comminuted condition of the bone, amputation was decided upon, and performed by circular method at the middle third, on May 21st, by Acting Assistant Surgeon M. L. Herr. The stump healed kindly." The patient was transferred to the Clay Hospital, Louisville, on July 11th, and subsequently to Camp Dennison, whence he was discharged on January 26, 1865, and pensioned. In his application for commutation he reported the condition of the stump as "healed over and perfectly well." The specimen (FIG. 536) consists of "the lower half of the left humerus, amputated for an ordinary gunshot fracture of the lowest third."

FIG. 536.—Shot fissuring of humerus. *Spec.* 3363.

CASE 1679.—Private P. Farley, Co. K, 23d New Jersey, aged 18 years, was wounded in the right arm, at Salem Heights, May 3, 1863, and entered Mount Pleasant Hospital, Washington, on May 8th. Assistant Surgeon C. A. McCall, U. S. A., performed amputation on May 18th, at the lower portion of the middle third, and contributed the specimen (Fig. 537), consisting of "the lower half of the right humerus, showing comminution over the condyles, involving the joint. The shaft is destroyed; the articular surface carious." On June 19th, the patient was transferred to Mower Hospital, Philadelphia, whence he was discharged on July 23, 1863, his term of service having expired. An artificial arm was furnished, five years afterward, by D. W. Kolbé, of Philadelphia, who reported the stump as being perfectly healed and the amputation as having been performed by flap method. The pensioner was paid June, 1875.

FIG. 537.–Comminution above condyles. *Spec.* 1179.

In several of the intermediary amputations at the middle third, where specimens of the shattered humerus or elbow joint are preserved, the lesions would, in the judgment of many surgeons, have justified primary amputation. The reasons that were thought to forbid delay until the inflammatory stage had passed, are rarely set forth:

CASE 1680.—Private G. Halsey, Co. D, 26th New York, aged 19 years, was wounded in the right arm, at Bull Run, August 30, 1862. On September 1st, he was admitted to Mount Pleasant Hospital, Washington. Medical Cadet E. Cones reported: "The patient, a remarkably strong, well developed, and healthy man, was admitted on September 1st. Amputation was performed on September 6th, by circular method, at the middle third, by Assistant Surgeon C. A. McCall, U. S. A. Not a single untoward symptom, locally or constitutionally, occurred, and the stump was completely healed in about three weeks." The specimen (Fig 538) consists of "the lower half of the right humerus, completely shattered for four and a half inches. The upper portion of the bones of the forearm are attached." The patient was discharged from service on November 24, 1862, and pensioned. In his application for commutation for an artificial arm, dated 1870, he stated that the "stump had very much perished away." The pensioner was paid on June 4, 1875.

FIG. 538. — Shot shattering of humerus. *Spec.* 163.

CASE 1681.—Private J. Otterbacher, Co. B, 55th Ohio, aged 17 years, was wounded at Chancellorsville, May 2, 1863. He was taken to the field hospital of the 2d division of the Eleventh Corps, where Surgeon W. H. Thorn, U. S. V., recorded: "Gunshot wound of arm." On May 25th, the patient was transferred to the Mansion House Hospital, at Alexandria. Assistant Surgeon J. B. Bellanger, U. S. V., reported: "A conoidal ball entered the posterior part of the elbow and passed out in front, fracturing and comminuting the joint badly. At the time of admission the parts were so infiltrated and swollen, and the pus so dark and fœtid, that upon consultation amputation was determined upon, and performed by the circular method, at the middle third. This boy's system was in a bad condition at the time, and the result is yet uncertain." The patient was discharged from service on August 24, 1863, and pensioned. In his application for commutation for an artificial limb, in 1870, he described the stump as being in a "sound condition," and stated that he believed "Surgeon C. Page, U. S. A., performed the amputation." The pensioner was paid on June 4, 1875. The specimen (FIG. 539) consists of "the lower half of the right humerus and upper portion of the bones of the forearm, after amputation. The ball entered the olecranon fossa, destroying the trochlea, and tearing up the coronoid process and anterior portion of the olecranon. The remainder of the articular surface, not involved in the comminution, is carious."—(*Cat. Surg. Sect.*, 1866, p. 170.) It was forwarded to the Museum by Surgeon Charles Page, U. S. A.

PLATE XLVII. TUBULAR SEQUESTRA FROM AMPUTATIONS OF THE HUMERUS.

Nos. 142, 1266, 4333, and 2209. SURGICAL SECTION.

TABLE LXXVIII.

Condensed Summary of Two Hundred and Fifty-Five Cases of Recovery after Intermediary Amputations in the Middle Third of the Shaft of the Humerus.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Adkins, J. L., Corp'l, H, 6th Iowa.	June 27, July 3, 1864.	Right; circ.; by Surg. A. Geslin, 48th Ill. Discharged April 29, 1865; pensioned. *Spec.* 3481.
2	Agnew, W. G., Pt., B, 3d Iowa, age 22.	April 7, 18, '62.	Right; flap. Discharged July 3, 1862; pensioned.
3	Allen, H. B., Pt., B, 117th N. Y., age 19.	Sept. 30, Oct. 16, 1864.	Left; circular; by A. Surg. D. R. Brower, U. S. V. Discharged May 16, 1865; pensioned.
4	*Anderson, B.*, Lieut., D, 38th Alabama.	Nov. 25, De.12.63.	Left; hæmorrhage. To Provost Marshal April 26,'64. *Spec.*2209.
5	Anderson, J., Pt., B, 161st N. Y., age 18.	April 8, 16, '64.	Right; flap; by A. A. Surg. I. C. Lee. Discharged May 17, 1864.

214	Schmidt, F., Corp'l, D, 103d New York.	May 7, 27, '63.	Left; flap. To V. R. C. Disch d Sept. 22, 1863; pensioned.
215	Scherich, I. W., Pt., A, 18th Pa. Cav., age 21.	Sept. 19, 22, '64.	Left; circular; by A. Surg. E. B. Nims, 1st Vt.C. Dis'd Mar.31,'65.
216	Schneider, C., Pt., H, 82d Ill., age 40.	July 1, 19, '63.	Right; by Surg. J. A. Armstrong, 75th Pa. Dis'd Jan. 5,'64; pens'd.
217	Schopp, J., Pt., F, 17th Ohio, age 20.	Mar. 3, 19, '65.	Left; flap; by Surg. Abernither, C.S.A. Dis'd Aug. 2,'65; pens'd.
218	Scott, R. A., Serg't, E, 9th Illinois Cavalry.	Dec. 3, 17, '63.	Right; by Surg. G. P. Christy, 9th Ill. Cavalry; (gangrene.) Dis'd April 14, 1864; pensioned.
219	Scott, W., Serg't, K, 141st Pa., age 34.	Oct. 27, No. 1,'64.	Left; flap; by Surg. W. Watson, 105th Pa. Disch'd May 10, 1865; pensioned.
220	Seiter, G., Pt., E, 23d Kentucky.	May 27, June 15, 1864.	Right; circular; by Surg. S. E. Fuller, U.S.V. Duty Oct. 12, 1864; pensioned. *Spec.* 3354.
221	Shaw, J. W., Pt., I, 142d Penn., age 23.	July 1, 8, '63.	Right. Disch'd October 23, 1863; pensioned.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
222	Sherman, D. J., Pt., I, 17th New York, age 23.	Aug. 31, Sept. 5, 1862.	Right; ant.-post. flap; by A. Surg. G. M. McGill, U. S. A. Disch'd Oct. 14.'62. Re-enlisted in V.R.C.
223	Sherman, F. A., Corp'l, H, 4th Maine, age 22.	May 5, 29, '64.	Left; circ.; by A.A.Surg. F.G.H. Bradford; (exc. ulna May 5; erysipelas.) Discharged March 7, '65; pensioned. *Spec.* 2503.
224	Shreckengost, H., Pt., C, 105th Pa., age 22.	May 3, 27, '63.	Right. Discharged Dec. 25, '63; pensioned. *Spec.* 1174.
225	Sigley, D., Pt., B, 85th Illinois, age 25.	July 20, 27, '64.	Right; ant.-post. flap; by Surg. Mattow, U. S. A. Discharged Aug. 2, 1865; pensioned.
226	Smith, B., Pt., I, 54th Col'd Troops, age 41.	July 18, Aug. 1, '63	Right; flap; by Surg. Mord, P.A. C.S. Dis'd Aug. 16, '65; pens'd.
227	Smith, J. W., Corp'l, E, 39th Iowa, age 25.	Oct. 5, 31, '64.	Right; circular; by Asst. Surg. G. W. Crossley, 57th Illinois. Disch'd May 24, '65; pensioned.
228	Smith, J. M., Pt., E, 10th N. J., age 32.	Oct. 19, 24, '64.	Right; circular; by Surg. C. H. Andrus, 176th New York. Discharged May 16, '65; pensioned.
229	Smith, C., Pt., K, 1st Tenn. Cav., age 29.	Nov. 8, 19, '64.	Left; circular; by Surg. W. Spencer, 10th Tenn. Cav. To V. R. C. April 5, 1865; pensioned.
230	Spochel, R., Pt., C, 6th Conn., age 44.	May 18, 24, '64.	Left; flap; by Dr. J.E.Garretson, Phila. Dis'd Mar. 29, '65; pens'd.
231	Stark, A., Serg't, D, 68th New York.	July 1, 15, '63.	Right; flap; by A. Surg. D. C. Peters, U.S.A. (July 1, excision ulna.) To V. R. C. Jan. 5, 1864. Disch'd Aug. 6, '64; pensioned.
232	Stanley, C. E., Pt., B, 33d New Jersey.	June 27, July 3, '64	Left. Discharged; pensioned.
233	Stevens, J. F., Pt., F, 1st Delaware.	May 12, 18, '64.	Left; flap; by Dr. G. Buck, of N. Y. Disch'd Oct. 23, '64; pens'd.
234	Stillwell, D. D., Serg't, B, 13th New York.	Aug. 30, Se. 15, '62.	Right; by A. A. Surg. W. Eddy. Disch'd Dec. 17, 1862; pens'd.
235	Totten, J. M., Serg't, C, 23d Indiana, age 33.	June 15, July 8, 1864.	Right; circular; by Surg. E. M. Powers, 7th Missouri. Disch'd Sept. 13, 1864; pensioned.
236	Townsend, J., Pt., H, 14th Infantry.	Aug. 30, Se. 5, '62.	Right; flap; by Surg. H. Bryant, U. S. V. Disch'd Oct. 30, 1862; pensioned.
237	Tuttle, D., Pt., I, 83d Pennsylvania.	Sept. 1, 13, '62.	Left. Discharged February 9, 1863; pensioned.
238	*Underwood, W. E.*, E, 30th Tennessee.	Sept. 20, Oc. 18, '63.	Left; by Surg. P. F. Eve, C. S. A.; hæmorrhage. Doing well.
239	Ulmer, D., Pt., M, 4th Penn. Cav., age 36.	Mar. 31, April 24, 1865.	Left; skin flaps, circ., of muscles; by A. A. Surg. H. Craft; (April 14, part of olecranon rem'd—erysipelas;) necrosed bone rem'd. Dis'd Sept. 3, '65; pens'd. *Spec.* 192.
240	Van Sickle, A. M., Pt., A, 23d Ohio.	Sept. 14, 19, '62.	Right. Discharged Dec. 14, 1862; pensioned.
241	Voorhees, W. S., Pt., K, 12th Ohio.	May 19, June 9, 1863.	Right; flap; by Surg. N. T. Graham, 12th Ohio. Disch'd Sept. 1, 1863; pensioned.
242	Vosburg, J. B., Pt., E, 45th Penn., age 19.	May 6, June 1, 1864.	Left; circ.; by A. A Surg. W. C. Minor; (May 6, amp'n fingers.) Disch'd March 16, 1865; pens'd.
243	Wareham, R. A., Corp'l, I, 6th Wisconsin.	Aug. 28, Se. 8, '62.	Left; by Surg. H. Bryant, U. S. V. Disch'd Dec. 21, 1862; pens'd.
244	Winning, W., Pt., A, 125th Ohio, age 36.	May 14, 21, '64.	Left; circ.; by A. A. Surg. M. L. Herr. Disch'd January 26, 1865; pensioned. *Spec.* 3363.
245	Wells, J., Pt., F, 19th C. T., age 21.	July 30, Aug., '64.	Right; flap; (July 30, exc. humerus.) Dis'd June 10, '65; pen'd.
246	Welch, D., Pt., A, 8th Iowa age 21.	April 6, 28, '62.	Right; flap; by A. A. Surg. J. C. Hughes. Disch'd June 25, 1862, pensioned.
247	West, W. C., Pt., B, 96th N. Y., age 26.	Oct. 27, Nov. 10, 1864.	Left; circ.; by Surg. V. W. Harrison, C.S.A. Disch'd June 13, 1865; pensioned.
248	*Wharton, W. C.*, Pt., G, 10th Ala., age 21.	July 2, 7, '63.	Right; hæmorrhage; (re-amp. Aug. 8, '63.) Fort McHenry Mar. 2, '64.
249	Whiting, J. E., Pt., D, 46th Illinois.	April 6, 10, '62.	Left. Discharged July 18, 1862; pensioned.
250	Wilson, J. H., Pt., F, 54th Mass., age 20.	Feb. 10, 24, '65.	Flap; by A. Surg. N. S. Roberts, 21st C. T.; gangrene; also loss of eyes. Dis. Aug. 20, '65; pen'd.
251	Winslow, E., Pt., K, 2d Maine Cavalry.	De. 27, '64 Jan. 1, '65.	Left; by Surg. G. W. Martin, 2d Me. Cav. Dis. Mar. 1, '65; pen'd.
252	Woodring, D., Pt., H, 148th Pennsylvania.	May 3, 11, '63.	Left; by Surg. C. Gray, 7th N.Y. Disch'd August 20, 1863; pen'd.
253	Young, S., Pt., C, 10th Minnesota, age 24.	July 14, 21, '64.	Left; flap; by Asst. Surg. J. C. G. Happersett, U. S. A. Disch'd September 28, 1864; pensioned.
254	Young, J., Serg't, A, 170th N. Y., age 20.	Aug. 25, 31, '64.	Left; double flap; hæmorrhage. Disch'd May 27, 1865; pens'd.
255	Zettler, J., Pt., C, 24th Wisconsin, age 19.	June 27, Jul. 27, '64	Right; circular; by Surg. A. Zipperlen, 108th Ohio. Discharged August 2, 1865; pensioned.

Of the successful intermediary amputations at the middle third above enumerated, eighty-six were practised by the circular method, one hundred and nine by flap methods, generally by transfixion and antero-posterior flaps, though four instances are mentioned of Teale's operation, and many in which lateral flaps were formed. The plan of reflecting skin flaps and dividing the muscles circularly, and that of forming a single flap accommodated to the injuries of the soft parts, were resorted to in a number of cases. The wounds were inflicted by shell fragments, grapeshot, or the premature explosion of cannon in fifteen cases. In twenty-six instances antecedent operations had been performed.[1] Consecutive operations, including eight re-amputations, were resorted to in sixteen cases.[2] Thirty of the cases were complicated by serious hæmorrhage, twenty-seven by sloughing, and twelve by gangrene.

Besides the six examples illustrated by drawings of specimens that precede the tabular statement, there were twenty-seven other cases of this series represented in the Army Medical Museum by pathological specimens, that are described by Dr. Woodhull in the sixth and seventh sections of the Catalogue of 1866, of the Surgical Section of the Museum. The numbers of the preparations are recorded in the Table.

§ *Fatal Cases.*—Intermediary amputation at the middle third of the arm resulted fatally in ninety-three cases. Sixteen amputations were subsequent to excisions lower

[1] As follows: Amputation of forearm, with consecutive ligation of the ulnar artery, in 1 case; disarticulation at the wrist in 2 cases; of fingers and portions of hand in 5 cases; excisions in shaft of humerus in 2 cases; excision of elbow joint in 7 cases; excision in radius or ulna in 3 cases; removal of fragments of olecranon in 1 case; extraction of ball through incision in 1; ligations of brachial in 2, of ulna in 1, of radial in 1.

[2] Thus: One patient underwent exarticulation at the shoulder; four, re-amputations at the upper third; three, re-amputations at the junction of the upper and middle thirds; six, removals of sequestra from protruding humerus; one, extirpation of bulbous extremities of nerves; one, a ligation of the brachial artery.

down in the limb, two to amputations lower down, and one to an ineffective ligation of the radial. Seven of the patients had received serious wounds in other parts of the body; in one case ulterior amputation of the opposite arm at the lower third was required. The fatal results were ascribed to the shock of operation in one case, to tetanus in three cases, to secondary hæmorrhage in seven, to pulmonary complications in six; in far the larger proportion of cases to purulent absorption or septic infection.[1] The amputations were on the right side in fifty cases, on the left in forty-one, not specified in tow cases.

FIG. 540.—Shot perforati'n of lower half of right humerus. *Spec.* 73.

CASE 1682.—Private J. V———, Co. C, 13th New York, age 21 years, was wounded in the right arm, at Bull Run, August 30, 1862. He was conveyed to the Episcopal Church Hospital, at Centreville, where Acting Assistant Surgeon W. W. Keen, jr., amputated the limb, at the middle third, on September 7th. The specimen (FIGS. 540, 541) was forwarded to the Museum by the operator, and consists of the lower half of the right humerus "perforated, with much comminution at the junction of the lower thirds."—(*Cat. Surg. Sect.*, 1866, p. 129.) On September 9th, the patient was sent to Fairfax Seminary Hospital, whence Surgeon D. P. Smith, U. S. V., reported: "Tetanus supervened two days after the patient's admission. The treatment consisted in the administration of extract of cannabis indica and of morphia. Death occurred on September 19, 1862."

FIG. 541.—Another view of the same specimen.

CASE 1683.—Private A. D———, Co. E, 8th New York Artillery, aged 23 years, was wounded at Cold Harbor, June 3, 1864. Surgeon J. F. Dyer, 19th Massachusetts, reported his admission to the field hospital of the 2d division, Second Corps, with "Gunshot wound of the left arm." On June 8th, the patient entered Emory Hospital, Washington. Surgeon N. R. Moseley, U. S. V., contributed the specimen (FIG. 542) to the Museum, with the following minutes of the case, furnished by Acting Assistant Surgeon E. B. Harris: "Gunshot wound of arm and shoulder. One ball entered three inches above the bend of the elbow, passed through the humerus and out at the opposite point posteriorly, fracturing the bone into the elbow joint. The other ball entered one inch below the acromion, and, passing down and out, made its exit at the inferior angle of the scapula. The parts, from four inches below and eight inches above the wound in the arm, were greatly swollen and tumefied, with slight erysipelatous inflammation, and sinuses extending above and below the wound for four inches. The patient was much exhausted from loss of blood and exposure on the field and in transit, with loss of appetite, diarrhœa, a quick and hurried pulse, disturbed sleep, and general instability of the system. June 9th, placed the patient in an easy position with slight extension of the parts, made a free incision adjoining the wound of entrance, and had a copious discharge of coagulated blood and pus. Ice-water dressings were applied to keep the parts cool day and night. The wound of the shoulder was injected with cold water, removing coagula and a piece of the coat of the patient, probably worn at the time of the injury. This treatment was continued up to June 15th, when the tumefaction of the arm had subsided, and extension was applied, with slight counter-extension, and treating as compound fracture, with the hope of obtaining union with anchylosis. June 16th, the wound of the arm continues to discharge a thin sanious matter, and the wound of the shoulder is discharging a more healthy pus. Appetite improving, and patient resting well at night with the use of anodynes. Cold applications were continued to the limb, and the wound cleansed night and morning with injections of water and solution of gum acacia. Stimulants of milk punch were given, with chicken broth and essence of beef daily. June 17th, diarrhœa checked; pulse and appetite better; patient slightly improving. June 18th, patient attacked with chills, continuing for some two hours, followed by fever, continuing during the day, with profuse sweating at night. The treatment was continued with the addition of the following: Sulphate of quinine twenty grains, aromatic sulphuric acid a drachm and a half, and brandy four ounces, given in doses of a table-spoonful every two hours during day and up to the patient's time of going to sleep. An anodyne was given at night. June 19th, patient restless during the previous night; appetite slight; uneasiness of the system. Discharge from wound of shoulder of a dark pitchy character with blood, and from the arm of a sanious character, with increased swelling and lividness of the parts. Continued the tonic mixture during the day with punch and oyster broth, and the dressing with cold water; anodynes at night. Called Dr. Risny as counsel, and concluded to remove the arm. June 20th, patient rested quietly during the night. At ten A. M. the arm was removed at the upper part of the middle third, the patient bearing the operation well. The flaps were left open for six hours, after which they were closed with sutures and supported by straps. Stimulants were given with nourishment during the day, and anodynes at night. The discharge from the shoulder continued of a dark offensive character. The patient was attacked with rigors, slight deliriousness, nausea and vomiting during the day, refusing to take food and commencing to sink. June 21st and 22d, patient continued to sink, remaining unconscious until death supervened, on June 23, 1864." The specimen consists of "the lower half of the left humerus, amputated for comminution of the lower third, with a fracture extending through the trochlea. The borders of the fracture are necrosed, and on the posterior surface of the shaft there has been some periosteal deposit."—(*Cat. Surg. Sect.*, 1866, p. 168.)

FIG. 542.—Shot comminution of lower part of left humerus. *Spec.* 2586.

[1] The proximate causes of death are noted on the returns as: Shock of operation in 1 case; tetanus in 3 cases; secondary hæmorrhage in 7; gangrene in 2; pyæmia in 44; typhoid, pleuro-pneumonia, or other pulmonary complications in 6; irritative fever and exhaustion in 21; typhoid fever in 2; diphtheritic infection of wound in 1; diarrhœa and dysentery in 6.

TABLE LXXIX.

Condensed Summary of Ninety-three Unsuccessful Cases of Intermediary Amputation in the Middle Third of the Shaft of the Humerus.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Adams, S., Pt , I, 119th Penn., age 23.	April 2, 12, '65.	Left; (excision of elbow April 10.) Died April 20, 1865, pyæmia.
2	Akhurst, J. S., Pt., C, 39th Ill., age 21.	May 20, 24, '64.	Left; circ.; by A. A. Surg. J. E. Garretson. Died May 28, '64, exh.
3	Aldrich, W., Pt., I, 2d Rhode Island.	June 3, 23, '64.	Right; circular. Died July 7, 1864.
4	Ames, W. H., Pt., C, 4th Maine, age 24.	May 11, 30, '64.	Left; circ.; by A. A. Surg. M. J. Grier; (hæm.; also w'd abdm'n.) Died June 17, '64, diar. *Spec.* 3780.
5	Bacon, B. W., Capt., G, 74th Ill., age 40.	June 27, July 14, 1864.	Right; flap; by Surg. J. E. Herbst, U. S. V.; (amp. left arm July 19.) Died July 21, 1864, pyæmia.
6	Baddorf, P., Pt., G, 96th Penn., age 18.	May 10, 24, '64.	Left; circ.; (hæm.;) necrosis. Died June 8, '64, pyæmia. *Spec.* 3552.
7	Barr, W. H., Corp'l, B, 62d Ohio, age 24.	Aug. 16, Sept. 8, 1864.	Right; circ.; by A. A. Surg. A. J. Smith; (hæm.) Died Sept. 11, '64, pyæmia.
8	*Benjamin, A.*, Pt., I, 53d N. C., age 23.	July 12, 18, '64.	Right; circular. Died August 8, 1864.
9	Brewer, J. R., Pt., E, 149th Pa., age 26.	May 8, 30, '64.	Left; circ.; by A. A. Surg. R. N. Atwood. Died June 6, '64. gang.
10	Brown, I., Pt., F, 5th N. Y. Cav., age 30.	Oct. 17, Nov. 9, 1863.	Right; circ.; by A. A. Surg. H. E. Paine; (erysip.; Nov. 1, amp. forearm; hæm.) Died Nov. 27, 1863, pyæmia.
11	Burt, S., Private, H, 1st Mich. S. S., age 20.	Sept. 30, Oc. 13, '64.	Left; circ.; by A. A. Surg. A. Ansell. Died October 21, 1864.
12	Bush, A. P., Pt., F, 1st Mass. Cav., age 29.	Oct. 14, 18, '63.	Right; flap; by A. A. Surg. T. H. Stillwell. Died Nov. 21, 1863, pyæmia. *Specs.* 1841 and 1842.
13	Camp, L. B., Pt., F, 5th Penn. Reserves.	June 30, July 10, 1862.	Left; double flap; by A. A. Surg. B. B. Miles. Died July 18, '62, pyæmia.
14	Carr, G., Corp'l, F, 36th Col. T., age 45.	Sept. 29, Oct. 23, 1864.	Left; flap; by A. A. Surg. F. P. Geisdorf; hæmorrhages. Died Oct. 28, 1864, exhaustion.
15	Clark, T. B., Pt., G, 17th Ohio, age 26.	May 27, June 10, 1864.	Circular; by Surg. S. E. Fuller, U. S. V.; (gangrene.) Died August 7, 1864, diarrhœa.
16	Darwood, H., Pt., I, 15th Infantry, age 17.	Aug. 8, Sept. 5, 1864.	Right; circ.; by A. Surg. T. A. McGraw, U. S. V.; (also w'd leg; hæmorrhage; gangrene.) Died Sept. 7, 1864, exhaustion.
17	Davis, J., Pt., E, 143d Penn., age 24.	June 18, 29, '64.	Right; circ.; by A. A. Surg. A. N. Brockway; (June 18, exc. radius.) Died Sept. 13, 1864, pyæmia.
18	Deitz, A., Pt., E, 8th N. Y. H. A., age 23.	June 3, 20, '64.	Left. Died June 23, 1864. *Spec.* 2566.
19	Dekruif, J. P., Pt., B, 16th Mich., age 28.	May 10, J'e 1, '64.	Right; circ.; by A. A. Surg. J. Case. Died June 29, '64. pyæmia.
20	Emory, C. E., Lieut., F, 12th N. H., age 34.	June 1, 26, '64.	Left; (hæm.) Died August 1, 1864, pyæmia and hæmorrhage.
21	Fergason, D. D., Pt., K, 2d Pennsylvania H'vy Artillery, age 23.	June 18. July 16, 1864.	Right; circ.; by Surg. R. B. Bontecou, U. S. V.; (thumb amp. J'e 18; gang.) Died Jul. 21, '64, exh'n.
22	Finn, J., Serg't, B, 22d Mass., age 23.	May 23, J'e 9, '64.	Right; circ.; by A. Surg. E. Seyffarth. Died June 13, '64, hæm.
3	Fitzgerald, W., Pt., B, 1st U. S. S. S., age 19.	Nov. 7, 12, '63.	Right; double flap; by A. Surg. W. Thomson, U. S. A.; (exc. elb. Nov. 8; erysipelas; hæmorr'ge.) Died Nov. 30, 1863, pyæmia.
24	Glines, J., Corp'l, C, 17th Vermont, age 38.	June 18, Jul. 1, '64.	Left; circ.; hæmorrhages. Died July 30, 1864, hæmorrhage.
25	Grant, G., Corp'l, B, 31st Maine, age 20.	May 12, 19, '64.	Left. Died May 30, 1864.
26	Grant, W., Pt., B, 59th New York, age 38.	Sept. 17, 30, '62.	Left. Died Oct. 5, 1862, tetanus. *Spec.* 381.
27	Harrowes, C., Pt., L, 3d New Jersey Cavalry.	Sept. 19, 22, '64.	Right; oval skin flap; by Surg. R. Curran, 9th N. Y. Cav.; (wound of back; Sept. 20, excis. humerus.) Died Sept. 29, '64, hæmorrhage, of wound in back.
28	Harper, P. W., Pt., A, 10th West Va., age 22.	Oct. 9, Nov. 8, 1864.	Left; circ.; by Surg. J. B. Lewis, U. S. V. Died Dec. 17, 1864, pyæmia. *Spec.* 4264.
29	Hayberry, G., D, 51st Pennsylvania, age 32.	Sept. 17, 28, '62.	Right. Died October 19, 1862, lung affection.
30	Hickox, T. C., Pt., K, 6th N. Y. Art., age 33.	Oct. 19, Nov. 1, 1864.	Right; flap; by A. A. Surg. B. B. Miles; (hæm'rhages.) Died Nov. 18, 1864, pyæmia.
31	Hiles, J., Pt., I, 1st Neb., age 20.	Feb. 27, Mar. 3, 1863.	Left; lateral flap; by Surg. H. A. Martin, U. S. V.; hæmorrhage. Died March 28, 1863, pyæmia.
32	Hinkley, B. F., Pt., A, 1st Mich. S. S., age 30.	May 9, 21, '64.	Left; ant.-post. flap; by A. A Surg. H. Craft; erysipelas. Died July 12, 1864, pyæmia.
33	Hodsden, D. C., Capt., H, 9th Ind., age 24.	June 24, July 13, 1864.	Left; circ.; by A. A. Surg. J. A. Hall; (exc. elbow June 24; gangrene.) Died July 27, '64, pyæ'a.
34	Hoover, J. W., Pt., I, 36th Ohio, age 21.	Sept. 14, 27, '62.	Right; circ.; by A. A. Surg. W. W. Keen, jr. Died October 6, 1862, pyæmia. *Spec.* 802.
35	Hughes, H., Pt., E, 21st Kentucky, age 21.	June 22, July 5, 1864.	Right; flap; by A. A. Surg. J. J. O'Reilly; (exc. elbow June 22.) Died July 6, 1864, pyæmia.
36	Hughes, F., Capt., E, 37th Indiana, age 27.	June 22. July 13, 1864.	Right; circ.; by A. A. Surg. J. H. Greene; (July 9, exc. ulna; gangrene.) Died July 28, '64, pyæ'a.
37	Kells, T., Pt., B, 106th New York, age 34.	Sept. 21, Oct. 5, 1864.	Left; lat. flap; by A. A. Surg. B. B. Miles; (hæm'age; aneurism.) Died October 15, 1864, pyæmia. *Spec.* 3435.
38	Kirk, J., Pt., I, 121st Ohio, age 23.	June 28, Jul. 15, '64	Right, circ.; by Surg. S. E. Fuller, U. S. V. Died July 21, '64, diarrh.
39	Krake, A., Corp'l, A, 27th Mich., age 31.	May 6, 12, '64.	Left. Died June 14, 1864, fever and shock.
40	Kreiger, P., Pt., F, 7th Pa. Cav., age 40.	Dec. 8, 19, '64.	Left; ant.-post. flap; by Asst. Surg. B. E. Fryer, U. S. A.; erysipelas. Died Jan. 2, 1865, pyæmia.
41	Krise, D. O., Pt., A, 1st Pa. Rifles, age 26.	June 17, July 10, 1864.	Left; circ.; by A. A. Surg. John Ransom; necrosis. Died August 3, 1864, pyæmia.
42	Lambert, T., Pt., E, 72d Pa., aged 20.	July 3, 30, '63.	Right. Died August 17, 1863, pyæmia.
43	Lamphier, J. G., Pt., D, 31st Maine, age 28.	May 12, J'e 6, '64.	Right; circ; by A. A. Surg. C. W. Carrier. Died June 20, '64. pyæ'a.
44	Leonard, H., Pt., H, 2d N. J. Cav., age 21.	June 10, 13, '64.	Right; circ.; by A. A. Surg. J. N. Sharp; (hæm'rhage; gangrene.) Died June 28, '64, pneumonia.
45	Lock, W., Pt., 1st Delaware.	Sept. 17, 30, '62.	Right; by Surg. H. S. Hewit, U. S. V. Died Oct. 16, 1862, irritative fever. *Spec.* 361.
46	Lutes, C., Pt., D, 23d Mich., age 23.	Dec. 3, 16, '64.	Left; ant.-posterior flap; by A. A. Surg. M. L. Herr; (Dec. 7, exc. radius; hæmorrhage; gangrene.) Died December 23, 1864.
47	Marsh, G. J., Pt., G, 11 Pa. Res., age 23.	Dec. 13, 18, '62.	Right; circular; by Surg. J. S. DeBenneville, 11th Penn. Res. Died Jan. 1, 1863. pyæmia.
48	McCormick, W. J., Corp., D, 5th Mich. C., age 24.	Mar. 31, Ap. 21, '65	Right; circ; by A. A. Surg. M. F. Price. Died May 1, '65, typ'd fev.
49	McCauley, J., Pt., L, 10th N. Y. C., age 29.	Mar. 31, April 19, 1865.	Left; circular; by A. A. Surg. A. H. Haven. Died May 1, 1865, pyæmia. *Spec.* 182.
50	McGovlin, M., Pt., H, 86th New York, age 28.	Oct. 27, Nov. 4, '64	Right; circ.; by A. Surg. H. Allen, U. S. A. Died Dec. 1, '64. pyæmia.
51	McLaughlin, B., Pt., Andrew's Mass. Sharpshooters, age 25.	May 30, June 17, 1864.	Right; circular; by A. A. Surg. E. P. Fitch; (exc. elbow May 30; gang.) Died June 23, '64, pyæmia.
52	Merrick, T., Serg't, F, 102d Illinois, age 25.	Oct. 20, Nov. 6, 1864.	Left; circ.; by A. A. Surg. P. L. Rice; (hæmorrhage; rad. lig. w'd hip.) Died Nov. 15, '64, exhaust'n.
53	Millhollen, H., Pt., E, 51st Illinois, age 19.	Nov. 29, Dec. 3, '64	Right; circ.; by A. A. Surg. S. L. Merrill. Died Dec. 24, '64. ch. diar.
54	Mooney, J., Pt., G, 11th Infantry, age 23.	May 12, June. 7, 1864.	Right; (exc. humerus May 12; hæmorrhages.) Died 15 minutes after operation.
55	Morse, W. H., Pt., C, 1st Maryland, age 32.	Aug. 18, Sep. 6, '64.	Right; circ.; by A. Surg. H. Allen, U. S. A. Died Sep. 9, '64, pyæmia.
56	Munson, C., Pt., K, 2d New York State Mil.	May 4, 31, '62.	Circular. Died June 29, 1862.
57	Noyes, C. A., Pt., D, 21st Wisconsin, age 23.	May 14, June 3, 1864.	Right; circular; by A. A. Surg. H. C. May. Died Aug. 12, 1864, pyæmia. *Spec.* 3370.
58	O'Brien, J., Pt., B, 1st Pa. Rifles, age 24.	May 8, June 3, 1864.	Right; skin flaps; cir. cut of mus.; by Surg. Z. E. Bliss, U. S. V.; (erysip.) Died June 4, '64. pyæmia.
59	Orin, D., Pt., H, 51st Ohio, age 23.	July 4, 26, '64.	Right; circular; by A. A. Surg. S. T. Williams; (gang'e.) Died Sept. 15, 1864, chronic diarrhœa.
60	Perry, A. D., Serg't, E, 2d Mich, age 28.	June 1, 28, '64.	Left; circ.; by A. A. Surg. P. C. Porter; (June 1, exc. radius; gang.; caries.) Died July 17, '64, pyæ'a.
61	Porter, J. T., Pt., C, 6th Maryland, age 28.	May 6, 12, '64.	Right; by Asst. Surg. J. C. McKee, U. S. A. Died June 8, '64, pyæmia. *Spec.* 124.
62	Powell, J., Corp'l, K, 101st Ohio, age 23.	Dec. 15, 27, '64.	Left; circ.; by A. A. Surg. J. F. Rolls; (hæm's.) Died Jan. 15, '65.
63	Rader, J., Pt., F, 6th Wisconsin, age 27.	July 1, 24, '63.	Left; circ.; by A. A. Surg. R. N. Downs; (hæmorrhages.) Died August 24, 1863.
64	Reed, T. A., Serg't, D, 51st Ohio, age 32.	Dec. 16, 20, '64.	Left; ant.-post flap; by A. Surg. W. B. Trull, U. S. V.; (Dec. 16, exc. el. jt.) Died Jan. 15, '65, pyæmia.
65	Robinson, W., Pt., B, 2d Penn. Art., age 19.	June 17, July 13, 1864.	Left; ant.-post. flap; by Surg. R. B. Bontecou, U. S. V.; (July 3d, exc. el. jt.; July 12, hæm.) Died July 15, '64, exh'n. *Spec.* 3030.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
66	Rosa, W. H., Pt., H, 20th N.Y.S.M., age 21.	Aug. 30, Sept. 10, 1862.	Right; circ.; by A. Surg. C. A. McCall, U. S. A. Died September 28, 1862, pyæmia. *Spec.* 165.
67	Ryal, J., Pt., A, 43d Col'd Troops, age 19.	July 30, Aug. 22, 1864.	Left; circ.; by A. A. Surg. W. W. Shapley; (July 31st, excision ulna:) hæmor. Died August 29, 1864, exhaustion. *Spec.* 3666.
68	Samson, C., Pt., C, 7th Col'd Troops, age 20.	Aug. 14, 18, '64.	Right; flap; by A. A. Surg. H. B. White. Died August 22, 1864, inflammation of lung.
69	Sammis, C. A., Serg't, D, 127th N. Y., age 21.	Nov. 30, Dec. 12, '64	Right; flap; by A. A. Surg. Wm. Balser. Died Dec. 22, '64, pyæmia.
70	Shepperd, D. G., Corp'l, I, 6th Connecticut.	Oct. 22, 26, '62.	Left; circular; (trac. jaws.) Died Oct. 28, '62; exhaust'n. *Spec.* 690.
71	Shults, J., Pt. D, 93d Penn., age 50.	May 12, June 9, 1864.	Left; circular; by A. A. Surg. L. Wells; (hæmorr's.) Died June 10, 1864, from shock. *Spec.* 2936.
72	Smith, R. L., Serg't, B, 17th Infantry.	July 3, 19, '63.	Circular; by A. A. Surg. B. B. Miles; July 25, hæmorrhage. Died July 26, 1863, pyæmia.
73	Smith, D., Pt., A, 57th Pennsylvania, age 36.	May 6, 20, '64.	Right; circular; by Asst. Surg. J. C. McKee, U. S. A. Died June 14, 1864, pyæmia.
74	Statler, N., Corp'l, E, 211th Penn., age 25.	April 2, 24, '65.	Right; flap; by A. Surg. T. G. Mackenzie, U.S.A. Died June 2, 1865, exhaustion.
75	Tasker, R., Corp'l, D, 4th Michigan, age 25.	May 5, 25, '64.	Right; circ.; by A. A. Surg. D.P. Wolhaupter. Died June 6, '64.
76	Tracy, H., Corp'l, A, 3d Iowa, age 32.	April 7, May 5, 1862.	Left; flap; by A. A. Surg. J. A. Murphy; (gangrene.) Died May 13, 1862, pyæmia.
77	Tyler, E. H., Pt., D, 11th Conn., age 45.	May 16, 22, '64.	Left; flap; by A. A. Surg. J. E. Garrettson; hæmorrhage; lig. brachial. Died July 14, 1864.
78	Urwiler, C. A., Serg't, C, 67th Pennsylvania.	May 5, 13, '64.	Left; single post. flap; by A. Surg. W. G. Bryant, 1st 2d O.; May 28, hæm. Died May 30, '64, typ. fev.
79	Van Nevil, W., Corp'l, E, 8th Michigan.	June 18, 22, '64.	Right; by A. Surg. M. J. Asch, U. S. A.; (ex. ulna.) Died July 7, 1864, diphtheria. *Spec.* 2985.
80	Varter, J., Pt., C, 13th N. Y.	Aug. 30, Sept. 7, 1862.	Right; by A. A. Surg. W. W. Keen, jr. Died Sept. 17, 1862, tetanus. *Spec.* 73.
81	*Watson, S. H.*, Pt., E, 5th Texas, age 21.	July 2, 15, '63.	Right. Died Sept. 13, 1863, exhaustion. *Spec.* 1937.
82	*Webb, H.*, Pt., I, 45th North Carolina.	Oct. 19, 23, '64.	By Surg. G. L. Miller, C. S. A.; erysipelas. Died Nov. 8, 1864, hæmorrhage; pyæmia.
83	White, H. M., Pt., A, 2d Wisconsin, age 19.	May 8, June 1, 1864.	Left; flap; by Surg. A. F. Sheldon, U. S. V.; June 20, gang. Died June 29, 1864, exhaustion.
84	*Wicker, W. B.*, Pt., 15th Virginia, age 21.	Sept. 17, 22, '62.	Circular. Died Sept. 25, 1862, pyæmia.
85	Willis, A., Pt., K, 8th Col. Troops, age 37.	Feb. 20, Mar. 7, 1864.	Left; double skin flaps; by A. A. Surg. C. T. Reber. Died Mar. 16, '64, typ. pneum. *Spec.* 2722.
86	Williams, J., Corp'l, A, 1st Michigan Cavalry, age 27.	June 12, July 7, 1864.	Right; circ.; by A. A. Surg. H. Craft; (erysipelas.) Died July 29, 1864, pyæmia.
87	Wilson, G. A., Pt., I, 5th Michigan.	May 5, 21, '62.	Right; flap; by A. A. Surgeon J. Neill; hæmorrhages. Died June 24, 1862, pyæmia. *Spec.* 222.
88	Winship, D., Pt., F, 9th N. H., age 19.	Sept. 17, Oct. 13, 1862.	Right; by A. Surg. J. A. Bigelow, 8th Conn. (Sept. 18, exc. el. jt.) Died Nov. 12, '62, typ. pneum.
89	Wise, I., Pt., D, 2d N. Y. Cav., age 31.	Nov. 12, 21, '64.	Right; anterior flap; by A. A. Surg. W. P. Moon. Died Dec. 3, '64, pyæmia. *Spec.* 2556.
90	Woodruff, F. B., Pt., K, 147th N. Y., age 22.	May 11, 31, '64.	Left; skin flaps and circular section of muscles; by A. A. Surg. W. G. Small. Died June 2, '64.
91	Wordley, J., Pt., K, 151st N. Y., age 25.	July 9, 14, '64.	Right; circ.; by A. A. Surg. J. H. Bartholf. Died July 19, 1864, pleuro-pneumonia.
92	Wyman, B., Pt., K, 8th Michigan.	May 31, June 29, 1862.	Right; circ.; by A. A. Surg. W. K. Cleveland. Died July 7, 1862, exhaustion.
93	Zipperer, D., Corp'l, B, 15th New York Heavy Artillery, age 23.	June 18, July 2, 1864.	Left; circ.; by A. A. Surg. A. Ansell; July 9, hæm. Died July 26, 1864, pyæmia. *Spec.* 2892.

In a considerable proportion of the cases in the two preceding tables of intermediary amputations at the middle third of the arm the ages are noted; but an analysis of these cases fails to indicate any very marked influence of age on the mortality.[1]

3. Intermediary Amputations at the Lower Third of the Arm.—One hundred and sixty-one intermediary amputations at the lower third of the arm were practised on one hundred and forty-nine Union and twelve Confederate soldiers. The limb implicated was not specified in three cases; in eighty-one the right, and in seventy-seven the left, extremity was sacrificed. The mortality rate was 41.6 per cent.

§ *Successful Cases.*—Ninety-four patients recovered after intermediary amputations at the lower third of the arm. Five returned to modified duty, seven were exchanged or paroled, and eighty-two were discharged, and, with few exceptions, pensioned.

Case 1684.—Lieutenant G. F. Quinn, Co. K, 155th New York, aged 33 years, was wounded at Ream's Station, August 25, 1864, and admitted to the field hospital of the 2d division, Second Corps, where Surgeon N. Hayward, 20th Massachusetts, noted: "Shot fracture of right forearm." Surgeon D. W. Bliss, U. S. V., contributed the specimen (Fig. 543), and reported the following history of the case: "The patient was wounded by a shrapnel shot, which entered the anterior aspect of the right arm, passed through the supinator longus muscle about two inches below the elbow joint. The arm was very much swollen, with a great deal of inflammation. Cold-water dressings, nourishing diet, tonics, and stimulants constituted the treatment until September 7th, when the arm was amputated, by flap method, by the Surgeon in charge. September 8th, patient doing well. December 1st, patient furloughed." The specimen consists of "the bones of the right elbow after amputation in the lowest third of the humerus for fracture of the outer condyle by an iron canister shot, which is attached. In the humerus there are two sections, the lower being an inch and a quarter below the final one."—(*Cat. Surg. Sect.*, 1865, p. 164.) The round iron shot weighs three hundred and twenty-two grains. The patient was mustered out of service on February 27, 1865, and pensioned. It appears that the stump subsequently became diseased, and that the pensioner submitted to secondary re-amputation; for, in his application for commutation for an artificial arm, he stated that a "second amputation was performed by Dr. Stone, at Boston;" also that the remaining stump of his injured

Fig. 543.—Perforation of elbow by shrapnel. *Spec.* 3208. ½

[1] The data are probably insufficient to warrant any very decided conclusions. The ages were recorded in two hundred and thirty-seven instances: 158 recoveries and 79 deaths. The mean of the ages of the patients who recovered was 22 years and 6 months; of those who died, 26 years and 6 months. Among the recoveries 31 patients were under 20; 65 from 20 to 25; 26 from 25 to 30; 23 from 30 to 40; 13 over 40. Those who died were: under 20, 12; 20 to 25, 30; 25 to 30, 15; 30 to 45, 18; over 40, 4,—the two series presenting an approach to uniformity in the ratios.

arm is "three inches long and tender." Examiner G. S. Jones, of Boston, March 21, 1865, certified: "The right arm has been amputated in its upper third. Disability total and permanent." The pensioner was paid on June 4, 1875.

CASE 1685.—Private W. M. Harris, Co. D, 130th Illinois, aged 24 years, was wounded in the right arm, at the siege of Vicksburg, June 25, 1863, and was sent from a Thirteenth Corps hospital on a transport steamer, and transferred to the Adams Hospital at Memphis on July 11th. Surgeon J. G. Keenon, U. S. V., contributed the specimen (FIG. 544), with the following memorandum of the case: "The wound was caused by a shell. A fortnight subsequently, on the patient's admission to this hospital, the limb being in a gangrenous condition, it was thought expedient to remove it. Acting Assistant Surgeon J. Thompson amputated at the lower third of the humerus on July 12th. The patient will get well." The specimen consists of the lower extremity of the right humerus, amputated in the lower third for gangrene following fracture of the outer condyle. The hospital case-book states that, in this case, there was extensive laceration of the soft parts, and that the injury was much more severe than would be suspected from an examination of the bone. The patient was discharged from service November 9, 1863, and pensioned. He was paid June 4, 1875.

FIG. 544.—Fracture of outer condyle by shell. *Spec.* 1707. ½

CASE 1686.—Private W. Bennett, Co. I, 138th Pennsylvania, aged 31 years, was wounded at the Wilderness, May 6, 1864. He was received into hospital of the 3d division, Sixth Corps, where Surgeon R. Barr, 67th Pennsylvania, noted: "Compound fracture of right radius; spicula removed." On May 20th, the patient entered Mount Pleasant Hospital, Washington, and, on the following day, he was transferred to Philadelphia. Acting Assistant Surgeon R. J. Lewis reported his admission to Christian Street Hospital with flap amputation of right arm, followed by favorable results. On September 30th, the patient was transferred to South Street, and subsequently to Broad Street Hospital, whence Acting Assistant Surgeon J. Tyson contributed the specimen (FIG. 545), and Assistant Surgeon T. C. Brainerd, U. S. A., reported the following history: "The patient was admitted on November 23d, from furlough, with amputation of the right arm at lower third, performed on May 16th, after gunshot fracture of the right radius, received May 6th. When he returned from furlough it was evident that much dead bone was still present in the stump, as detected by the probe, while the lower three inches appeared somewhat thickened, hard, and 'honeycombed.' On December 3d, it was concluded to cut down upon the bone and remove such part as would appear necrosed. Ether being administered, the operation was performed by Acting Assistant Surgeon J. Tyson, by an incision along the middle line of the outer half of the stump, carried up four inches on outside of arm to avoid the brachial artery. The bone being bared, presented the peculiarly riddled and broken-down appearance characteristic of dead bone, many points being so soft that they were easily broken by pressure between the fingers. About three inches of bone were removed by chain-saw. The extremity of the remaining portion being still soft, about one and a half inches additional was removed by bone forceps in small fragments. It was noticed that the inner side of the humerus became hard and healthy before the outside, upon which the disease extended higher. The bone was taken off, however, high enough up to cover, as is thought, all diseased portion. None of the flap was removed, so that after the operation it extended some four inches below the extremity of the humerus. No arterial vessels of any size were opened, and therefore no ligatures were required. The incision was closed with lead wire, dry dressings applied and continued for two days, when they were substituted by lead water and laudanum. December 9th, edges of incision nicely approximated at upper portion, while healthy discharge escapes at the end of the stump. December 14th, the entire incision is at this date cicatrized except about an inch at the upper portion. December 31st, patient is walking about as usual, goes out on pass, and is in excellent health. But two small points are uncicatrized. January 4th, cicatrization is complete, and the stump presents a most gratifying result. The patient was discharged the service January 28, 1865, at which time the stump was entirely healed, and an artificial limb had been fitted." The specimen comprises three inches from the stump of the right humerus nearly seven months after amputation, and consists of a large but spongy involucrum, removed by the chain-saw. In his application for commutation for an artificial arm, dated 1870, the pensioner reported the stump as being in a "healthy condition." He was paid on June 4, 1875.

FIG. 545.—Sequestrum and osteoporosed involucrum resected from stump of right humerus. *Spec.* 4195. ½

CASE 1687.—Private P. Harvey, Co. F, 2d Infantry, aged 25 years, was wounded in the left forearm, at Fredericksburg, December 13, 1862, and was sent to Point Lookout Hospital on December 16th. Assistant Surgeon C. Wagner, U. S. A., decided that an attempt to save the shattered limb would be hopeless, and amputated at the lower third of the humerus on December 21st, sending a preparation of the bones of the forearm to the Museum (*Cat. Surg. Sect.*, 1865, p. 181, *Spec.* 923), with the following history of the case, compiled by Medical Cadet I. S. Lombard: "The patient was shot through the forearm by a minié ball, which, entering on the flexor side a little above the carpal articulation, passed through the radius, fracturing it extensively. When admitted there was considerable swelling of the hand and forearm, which increased after admission, extending to the elbow. On December 18th, two days after the patient's arrival, hæmorrhage from the radial artery took place, and was with difficulty checked by the application of compresses. The arm continued to swell and also began to assume a gangrenous appearance, and, as the patient's strength was evidently giving way, amputation was performed at the lower third of the humerus, December 21st, by Assistant Surgeon C. Wagner, U. S. A. After the operation the man gradually improved, and was discharged cured about the middle of February. The circular method was adopted in the amputation." The specimen consists of the left radius and ulna, showing the radius shattered in the lowest fourth, with longitudinal splintering half way up the shaft, the posterior surface of the bone bearing traces of the corrosive effect of the topical application. Assistant Surgeon W. Thomson, U. S. A., reported the patient's admission to Douglas Hospital February 23d, and his progress, as follows: "The stump was swollen and tender, and on examination an exfoliation was discovered, and removed on March 27th. The discharge ceased very soon, and the patient was discharged from service on March 24, 1863, with a good stump." The necrosed fragment extracted was contributed by Dr. Thomson to the Museum, and is represented in the upper right-hand figure of PLATE XLVII. It consists of a tubular sequestrum two inches in length. (*Cat. Surg. Sect.*, 1866, p. 137, *Spec.* 1235.) The pensioner re-enlisted in the general service May 16, 1863, and was placed on duty in the Adjutant General's Office, where he is still serving. He reports the stump as being in good condition. His pension was paid June 4, 1875.

Table LXXX.

Condensed Summary of Ninety-four Cases of Recovery after Intermediary Amputation in the Lower Third of the Shaft of the Humerus.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Austin, J. P., Pt., K, 121st N. Y., age 27.	May 3, 24, '63.	Left. Discharged December 30, 1863; pensioned.
2	Barker, A., Pt., I, 7th Rhode Island.	Dec. 13, 28, '62.	Right; flap. Disch'd Feb. 4, '63; pensioned. Re-amp. May 18, '64.
3	Bennett, W., Pt., I, 138th Penn., age 31.	May 6, 16, '64.	Right; flap; (exc. dead bone Dec. 30.) Disch'd Jan. 28, 1865; pensioned. *Spec.* 4195.
4	Berry, P., Corp'l, G, 23d Illinois, age 27.	June 21, 24, '64.	Left; ant.-post. flap; by A. A. Surg. W. B. Crain; (hæmor'age; lig. brachial July 1.) Disch'd Dec. 5, 1864; pensioned.

92	Wunsch, E., Pt., G, 29th New York.	May 3, 8, '63.	Left. Disch'd August 14, 1863; pensioned.
93	Yates, O. J., Pt., F, 11th Maine, age 37.	Aug. 16, Sept 15, 1864.	Left; circ.; by A. A. Surg. E. P. Fish; (gangrene.) Disch'd Jan. 20, 1865; pensioned. Amp. at shoulder joint June 29, 1865.
94	Zink, T., Pt., H, 45th New York, age 24.	July 2, 15, '63.	Left; circ.; by Asst. Surg. H. S. Schell, U. S. A. Dis'd Nov. 21, '63.

§ *Fatal Cases.*—Sixty-seven patients died after intermediary amputations at the lower third of the arm.[1] Circular and flap incisions were employed in about equal proportions.[2] Fifteen patients had undergone serious operations already,[3] and four suffered from wounds in other regions. In one of the last group the opposite forearm was amputated simultaneously with the amputation at the lower third.

FIG. 546.—Shot fissure of lower extremity of right humerus. *Spec.* 322.

CASE 1688.—Private C. H. Warren, Co. F, 20th New York State Militia, aged 30 years, was wounded at Bull Run, August 30, 1862, and admitted to the Methodist Church Hospital, at Alexandria, on September 2d. Surgeon J. E. Summers, U. S. A., contributed the specimen (FIG. 546) with the following report: "The patient was shot through the right elbow, the ball entering posteriorly, shattering the olecranon process and producing fracture of the internal condyle of the humerus. The arm was amputated, on September 5th, by Acting Assistant Surgeon A. Delaney. Death occurred, from pyæmia, on September 27, 1862." The specimen consists of the lowest third of the right humerus, amputated for oblique fracture near the inner condyle, with loss of the posterior portion of the trochlea.

CASE 1689.—Private J. H——, Co. A, 140th New York, aged 28 years, was wounded at Gettysburg, July 2, 1863, and admitted to the field hospital of the 2d division, Fifth Corps, where Assistant Surgeon C. Wagner, U. S. A., recorded: "Gunshot wound of left forearm. Patient transferred to General Hospital on July 13th." Acting Assistant Surgeon C. H. Jones reported: "The patient was admitted to Jarvis Hospital, Baltimore, on July 14th, having been wounded by a minié ball which passed through the left wrist joint, producing a compound comminuted fracture of the radius and ulna. A high degree of suppurating inflammation came on, extending to the elbow joint, and rendering amputation necessary on the 28th. The stump looked healthy, and he seemed to improve up to the 20th of August, when he suddenly became affected with the symptoms denoting pyæmia, from which he died on August 24, 1863. Autopsy twenty-four hours after death: Pus found in both lungs, with adhesion of left lung to costal pleura. Right lobe of liver softened, and several large abscesses found in the posterior portion; one of them, when opened, contained about four ounces of pus. A large abscess was also found under the sheath of the rectus muscle near the pubis." The specimens were contributed to the Museum by Assistant Surgeon C. Wagner, U. S. A., in charge of the hospital. The first one consists of a ligamentous preparation of the left hand, wrist, and lower portion of the bones of the forearm, which were fractured at their articulation with each other and with the carpus, opening the joint. The *post-mortem* specimen consists of the stump of the left humerus, showing the extremity necrosed and superficial caries extending over the lower half of the shaft. There was no deposit of callus. (*Spec.* 1711.) In addition, a small portion of liver was contributed, in the upper margin of which is an irregular abscess about the size of a hen's egg.—(*Cat. Surg. Sect.*, p. 495. *Spec.* 2037.)

[1] The proximate causes of death are recorded: Tetanus in 3 cases, secondary hæmorrhage in 14, gangrene in 12, pyæmia in 25, pneumonia in 4, ichoræmia in 1, anæmia and debility in 2, typhoid fever in 2, cardiac disease in 1, chagrin from disappointment in promotion in 1, and diarrhœa in 2 cases.

[2] It is noted that the circular method was adopted in 24 cases; the flap method in 22,—antero-posterior flaps being made more frequently than lateral flaps. In 21 cases the mode of operation was not described.

[3] Thus: One had the opposite arm amputated at middle third, another, a portion of the hand. Three had submitted to excisions of the elbow joint; three to excision of the ulna, one of whom had also been amputated at the middle third of the forearm, and four to excision of the radius. In one the fractured portion of condyle had been extracted; in one the ulnar artery, and in another the radial artery, had been tied.

TABLE LXXXI.

Condensed Summary of Sixty-Seven Unsuccessful Cases of Intermediary Amputations in the Lower Third of the Shaft of the Humerus.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Bacon, B. W., Capt., G, 74th Illinois, age 40.	June 27, July 19, 1864.	Left; flap; by A. A. Surg. J. H. Green; (gangrene; also amp. right arm, middle third, July 14.) Died July 21, 1864, pyæmia.
2	Beal, B. W., Pt., A, 20th Mass., age 24.	May 6, 15, '64.	Left; ant.-post. flap; by Surg. R. B. Bontecou, U. S. V. Died May 28, 1864, exhaustion.
3	Bell, G. L., Serg't, E, 10th Conn., age 34.	Dec. 15, 27, '62.	Right; flap; (ulna ligated.) Died Mar. 11, 1863, from disappointm't.
4	*Beveridge, R.*, Pt., D, 62d Virginia.	Oct. 29, Nov. 7, '64	Right. Died November 11, 1864.
5	Brand, D., Pt., K, 14th New Jersey, age 29.	Sept. 19, 26, '64.	Left; flap; by A. A. Surg. J. Youngloye. Died Oct. 5, 1864.
6	Burns, T. R., Pt., G, 56th Mass., age 38.	May 6, 13, '64.	Left. Died June 3, 1864.
7	Chatfield, J., Pt., E, 6th Ohio Cav., age 32.	June 21, July 14, 1863.	Left; by A. A. Surg. C. H. Osborn; (hæmorrhages; right forearm amputated.) Died July 14, 1863.
8	*Chisolm, O.*, Corp'l, E, 5th Louisiana.	July 9, 18, '64.	Right; circ.; by Surg. C. H. Todd, C. S. A. Died Aug. 2, '64, pneum.
9	Clark, J. W., Adj't, 1st Maine H. A., age 28.	June 18, July 7, 1864.	Right; circ.; by A. A. Surg. A. N. Brockway. Died July 31, 1864, pyæmia.
10	Condon, P., Serg't, F, 69th Penn., age 24.	Aug. 25, Sep. 4, '64.	Right; by A. A. Surg. T. F. Belton. Died September 8, 1864.
11	Conrad, A., Pt., C, 8th Illinois Cav., age 27.	June 21, July 9, 1863.	Flap; by A. A. Surg. G. McCoy; (hæmorrhages.) Died July 11, 1863. *Specs.* 1386 and 1387.
12	*Crump, G. L.*, Pt., Crutchfield's Art., age 25.	April 6, 13, '65.	Left; flap; by A. Surg. W. Carroll, U. S. V. Died May 10, 1865, pyæmia. *Spec.* 4165.
13	Daniels, W. A., Pt., E, 2d Massachusetts.	Aug. 9, 25, '62.	Left; (also wounds of back; hæm.; ex. ulna Aug. 21;) hæm. Aug. 25. Died Sept. 5, 1862, pyæmia.
14	Ducklin, W., Pt., G, 82d New York, age 54.	May 18, June 3, 1864.	Left; circ.; by A. Surg. H. Allen, U. S. A.; erysipelas. Died June 26, 1864. *Spec.* 2035.
15	Fleagle, J. B., Pt., H, 140th Pennsylvania.	Aug. 14, Sept. 7, 1864.	Right; flap; by A. A. Surg. C. H. Weaver; (gangrenous.) Died Oct. 9, 1864, debility.
16	Green, W. H., Lieut.-Col., 173d New York.	April 8, May 6, 1864.	Left; circ.; by A. Surg. S. H. Orton, U. S. A.; (excision elbow April 8.) Died May 14, 1864.
17	Griswold, H., Pt., H, 154st N. Y., age 37.	June 3, 11, '64.	Left; lat. flap; by A. A. Surg. F. F. Maury; (June 3, ex. radius; gangrenous; hæmorrh'e.) Died June 19, 1864, heart disease.
18	*Gross, J.*, Corp'l, H, 55th Alabama, age 20.	July 20, Aug. 10, 1864.	Left; circ.; by A. A. Surg. R. L. McClure. Died Aug. 14, 1864, exhaustion.
19	Haeggle, F., Pt., A, 2d Penn., age 40.	Aug. 18, 27, '64.	Left; flap; by A. A. Surg. W. F. Leitch. Died August 28, 1864.
20	Halderman, P. H., Pt., B, 47th Penn., age 22.	Oct. 19, Nov. 5, '64	Right; flap; by Surg. Z. E. Bliss, U. S. V. Died Nov. 20, '64. pyæ'a.
21	Healey, J., Pt., A, 140th New York.	July 2, 28, '63.	Left; caries; necrosis. Died Aug. 24, 1863. pyæmia. *Specs.* 2967, 1711, and 1614.
22	Heald, P. T., Corp'l, A, 19th Maine, age 23.	July 2, 29, '63.	Right. Died August 5, 1863, pyæmia. *Spec.* 2789.
23	Heffelfinger, H., Pt., G, 24th Iowa.	April 8, 29, '64.	Left; circ.; by A. A. Surg. S. H. Orton, U. S. A. Died May 15, '64.
24	Hemminger, F., Pt., G, 183d Penn., age 50.	May 6, 18, '64.	Right; flap; by A. Surg. J. C. McKee, U. S. A. Died May 18, '64, tetanus. *Spec.* 2329.
25	Hill, W., Pt., C, 2d U. S. Infantry, age 26.	May 9, 23, '64.	Left; flap; by Surg. D. W. Bliss, U. S. V.; (gangrene.) Died June 12, 1864. *Spec.* 2337.
26	Hoffard, M., Pt., G, 104th Pennsylvania.	May 31, J'e 13, '62.	Left; by A. A. Surg. T. B. Castle. Died July 1, 1862, pyæmia.
27	Hoshienter, J., Pt., K, 37th Wis., age 28.	Aug. 19, 30, '64.	Left; circ.; by A. A. Surg. A. N. Brockway; (gangrene.) Died September 3, 1864, pyæmia.
28	Humley, J., Pt., H, 80th Indiana, age 35.	Nov. 29, Dec. 16, 1864.	Left; circ.; by Surg. H. B. Stearns, U. S. V.; (erysipelas.) Died Jan. 11, 1865, anæmia.
29	Hunt, C., Pt., H, 57th Indiana, age 22.	June 22, July 19, 1864.	Right; by A. A. Surg. S. H. Olden, (exc. ulna; gang.; forearm amp. July 15.) Died July 21, '64, exh'n.
30	Jones, C. W., Corp'l, B, 108th New York.	Dec. 13, 22, '62.	Left; by Surg. E. Bentley, U. S. V. Died Dec. 28, '62, hæm. *Spec.* 615.
31	Kennelly, J., Pt., K, 170th N. Y., age 32.	Aug. 15, Sept. 9, 1864.	Right; circ.; by A. A. Surg. A. A. Smith; (Aug. 15, excision elbow joint; hæmorrhage.) Died Sept. 24, 1864, pyæmia. *Spec.* 3651.
32	Killips, R. C., Serg't, F, 21st Wis., age 24.	Aug. 7, 28, '64.	Right; circ.; by A. A. Surg. C. S. Merrill; (Aug. 28, hæm.) Died Sept. 1, '64. erysipelas, pyæmia.
33	Kirtz, G. W., Pt., B, 61st Ohio, age 19.	July 20, Aug. 9, 1864.	Right; flap; by A. Surg. B. E. Fryer, U. S. A. Died August 10, 1864, typhoid fever.
34	Klein, R., Pt., E, 111th Penn., age 36.	June 21, 28, '64.	Right; circ.; by A. A. Surg. M. J. Franklin; July 3, gang. Died July 3, 1864, ichoræmia.
35	Knapp, J. L., Pt., E, 112th N. Y., age 18.	June 3. Jul. 1, '64.	Right; flap; by Surg. H. Palmer, U. S. V. Died July 3, 1864, exhaustion.
36	Knock, A., Sergeant, B, 84th Ill., age 36.	June 27, July 24, 1864.	Left; circ.; by Surg. R. L. Stanford, U. S. V.; (gang.; hæm.; lig. radial.) Died October 11, 1864, diarrhœa, exhaustion.
37	Kulthau, H., Serg't, L, 1st New Jersey Cav., age 27.	May 28, June 11, 1864.	Right; circ.; by A. A. Surg. O. W. Peck; (May 28, excision radius; hæm.) Died June 19, 64, pyæ'ia.
38	La Fond, P., Pt., F, 20th Wis., age 24.	April 2, 6, '65.	Left; by Surg. E. Powell, 72d Ill. Died April 24, 1865, pyæmia.
39	Lintner, J. I., Pt., B, 115th New York, age 21.	July 5, 29, '64.	Left; flap; by A. Surgeon H. M. Sprague, U. S. A.; (July 29, hæm.) Died August 1, 1864, exhaustion.
40	Mathews, A., Pt., C, 35th Ind., age 20.	June 19, July 17, 1864.	Left; circ.; by Surg. R. R. Taylor, U. S. V.; (June 19, excision ulna.) Died August 29, 1864, pyæmia.
41	Mayo, J., Pt., D, 10th Vermont, age 20.	Oct. 19, No. 10, '64	Right; circ.; by A. A. Surg. J. Neff. Died Nov. 27, 1864, pyæmia.
42	Morris, J., Pt., E, 57th Indiana.	June 27, July 26, 1864.	Right; circ.; by A. A. Surg. B. E. Fryer, U. S. A. Died July 27, 1864, pyæmia.
43	Morain, M., Pt., F, 3d Vermont, age 28.	May 6, 28, '64.	Right; (amp. finger May 6; erysip.) Died June 24, 1864, pyæmia.
44	Nash, J. E., Pt., B, 9th New York Heavy Artillery, age 25.	July 9, 21, '64.	Left; circ.; by A. A. Surg. B. H. McCleerey; Aug. 2, hæm.; lig. brachial. Died Aug. 7, 1864.
45	Noel, P., Pt., I, 28th Iowa, age 29.	May 16, 26, '63.	Left; gangrenous. Died July 20, 1863.
46	*Ogletree, B. F.*, Pt., I, 13th Georgia, age 36.	July 10, Aug. 6, '64	Right; circ.; by Surg. A. Chapel, U. S. V. Died Aug. 23, 1864, exhaustion.
47	Otis, I. L., Pt., D, 83d Penn., age 25.	June 27, July 9, '62	Right; by Surg. R. H. Coolidge, U. S. A. Died Aug. 10, '62. pyæ'ia.
48	Paine, W., Pt., K, 67th Ohio, age 24.	May 10, 18, '64.	Left; circ.; by A. A. Surg. J. S. Hill. Died July 5, 1864, typhoid fever.
49	Peck, D. R., Pt., E, 13th Connecticut.	Mar. 21, Ap. 10, '63	Left; by A. Surg. J. S. Dolson, 161st N. Y. Died April 15, 1863.
50	Pendergrast, P., Pt., A, 2d Maryland, age 50.	Aug. 13, 16, '64.	Right; flap; by A. A. Surg. W. B. Crain. Died Sept. 1, '64, pyæmia.
51	Phinney, J., Capt., K, 86th N. Y., age 28.	May 10, 15, '64.	Left; skin flaps and circ. sec. muscles; by Surg. H. W. Dueachet, U. S. V.; (gang.) Died Aug. 10, '64.
52	Pierce, A., Pt., H, 8th Maine, age 29.	June 3, 20, '64.	Right; ant.-post. flap; by A. Surg. W. Webster, U. S. A. Died June 27, 1864, pyætnia.
53	Rhode, C. B., Pt., C, 25th Iowa	Jan. 11, Feb. 1, '63	Left; by A. A. Surg. T. T. Smiley; gangrene. Died Feb. 25, 1863.
54	Rose, W. E., Pt., G, 143d N. Y., age 23.	May 15, 24, '64.	Left. Died June 12, 1864, diarrhœa.
55	Sander, T., Pt., E, 23d Col'd Troops, age 20.	July 30, Au. 16, '64	Right. Died.
56	Schwartz, W., Pt., I, 29th Illinois, age 30.	Mar. 30, April 24, 1865.	Right; ant.-post. flap; by Surg. J. J. B. G. Baxter, U. S. V. (Mar. 30, excis. radius.) Died May 4, '65, typhoid pneumonia.
57	Skellinger, P., Serg't, F, 15th N. J., age 23.	May 8, 15, '64.	Left; ant.-post. flap; by Surg. A. F. Sheldon, U. S. V.; gangrene. Died May 27, 1864, exhaustion.
58	Soper, W. F., Pt., C, 17th Maine, age 26.	April 6, 14, '65.	Right; circular; by A. A. Surg. W. H. Lathrop. Died May 7, 1865.
59	Stene, J. H., Serg't, K, 7th Maine, age 24.	May 11, 21, '64.	Right; circ.; (May 11, ex. radius.) Died June 16, '64, pyæmia.
60	Stoneberner, J., Pt., K, 33d Ohio, age 30.	May 15, 25, '64.	Left; circular; by A. Surg. R. McNeilly, 19th Ohio. Died May 31, 1864, pyæmia. *Spec.* 3365.
61	Thackery, T. J., Pt., A, 95th Ohio, age 27.	May 23, 31, '63.	Right; (May 23, humerus removed; hæm'e.) Died June 27, '63, typh'd fever and hæmorr'e. *Spec.* 2092.
62	Thomas, E. L., Pt., F, 144th N. Y., age 24.	Nov. 30, Dec. 13, 1864.	Right; flap; by A. Surg. C. T. Reber, U. S. V.; (Dec. 13, hæmorrhage.) Died Jan. 1, 1865.
63	Warren, C., Pt., F, 20th New York, age 30.	Aug. 30, Sept. 5, 1862.	Left; by A. A. Surg. A. Delaney. Died Sept. 27, 1862, pyæmia. *Spec.* 322.
64	Widner, N., Pt., D, 10th New York, age 19.	Aug. 23. Sep. 4, '64.	Flap; by A. Surg. J. C. McKee, U. S. A. Died Sep. 19, '64. pyæmia.
65	Willis, B., Pt., E, 50th Ohio, age 39.	Nov. 30, Dec. 26, 1864.	Right; circular; by Surg. J. F. Randolph, U. S. A.; (gangrene; erysipelas.) Died Feb. 11, 1865.
66	Wing, L. D., Pt., F, 121st N. Y., age 31.	May 10, June 3, 1864.	Right; circ.; by A. A. Surg. H. B. Knowles; (May 10, excis. ulna.) Died June 20, 1864, pyæmia.
67	Young, R. B., Pt., K, 102d Penn., age 42.	May 5, 17, '64.	Right; by A. A. Surg. F. G. H. Bradford. Died May 20, 1864, tetanus. *Spec.* 4706.

4. Intermediary Amputation of the Arm without Indication of the Seat of Incision.—Forty-six of the reported cases of intermediary amputation come under this head. These operations were practised on thirty-nine Union and seven Confederate soldiers, of whom four were exchanged or paroled, eight were discharged and pensioned, and thirty-four died, a predominance of unsuccessful cases appearing, as usual, in series of imperfectly recorded observations.

§ *Successful Cases.*—The twelve successful cases of intermediary amputations of the arm in which the exact seat of ablation was unspecified were uncomplicated by wounds in other regions or by antecedent operations. Six of the operations were on the right, and five on the left arm, and in one case this point was not mentioned.

TABLE LXXXII.

Condensed Summary of Twelve Cases of Recovery after Intermediary Amputations of the Arm, the Point of Ablation Unspecified.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Babb, S., Pt., C, 7th Mo. Cavalry, age 25.	Aug. 16, Sep. 1, '62.	Right. Discharged Jan. 27, 1863.	7	*Messer, J.*, Pt., E, 37th Alabama.	Nov. 25, De. 12, '63.	Left; gangrene. Exch'd February 14, 1864.
2	*Bachelor, H. H.*, Pt., I, 30th N. C., age 24.	May 3, 24, '63.	Recovered.	8	Miller, W., Corp'l, H, 16th Ohio.	De. 28, '62, Jan. 11, 1863.	Left; by A. A. Surg. H. Hard; (amp. shoulder joint Jan. 29, '63.) Disch'd April 14, 1863; pens'd.
3	*Fletcher, J. F.*, Serg't, B, 14th Tenn., age 21.	July 3, 10, '63.	Right. To Provost Marshal Sept. 1, 1863.	9	Nash, A. P., Pt., C, 12th Massachusetts.	Aug. 30, Sept. 6, 1862.	Right; (re-amputat'd Oct. 18, '62.) Discharged Dec. 19, 1862; pensioned.
4	Hunter, J. H., Corp'l, B, 12th New York.	June 27, July 7, 1862.	Right; by A. A. Surg. A. Claude. Disch'd Sept. 6, 1862; pens'd. Amp. shoul. joint April 30, 1863. Died Aug. 11, 1871.	10	Palmer, B. D., Serg't, C, 3d Kansas Cavalry.	July 2, 12, '63.	Right; by Surg W. Wakefield, 9th Kansas Cav.; (arm re-amp.) Disch'd April 18, 1864; pens'd.
5	*Kelley, J.*, I, 10th Tenn.	Sept. 19, Oct. 2, '63.	Right; by Surg. P. F. Eve, C. S. A.; (hæmorrhage.) Doing well.	11	Svendsen, J. E., Pt., I, 1st New York, age 30.	June 30, July, '62.	Left; (re-amp Aug., 1862.) Dis'd Jan. 29, 1863; pensioned.
6	Lumbeck, I. J. K., Pt., D, 12th Indiana.	Aug. 30, Sept. 4, 1862.	Left; by Dr. O'Farrell. Disch'd Feb. 19, 1863; pensioned. (Arm re-amp. January, 1865.)	12	Vandemark, J., Pt., A, 143d Penn., age 45.	July 1, 11, '63.	Left. Discharged Dec. 9, 1863.

Six of the patients underwent re-amputation,—two at the shoulder joint, and four high up in the continuity. Two survived attacks of gangrene and secondary hæmorrhage.

§ *Fatal Cases.*—Of the patients of the series of thirty-four unsuccessful intermediary amputations of the arm without specification of the precise seat of incision, five had been subjected to antecedent operations,—to excision of the shaft of the ulna in one case, of the elbow joint in one, and of the shaft of the humerus in three cases; three had received serious though not mortal wounds in other regions.

TABLE LXXXIII.

Condensed Summary of Thirty-four Unsuccessful Cases of Intermediary Amputations of the Arm, the Point of Ablation Unspecified.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Brown, W., Capt., I, 145th Pennsylvania.	Dec. 13, 18, '62.	Died December 24, 1862.	9	Grier, T., I, 2d Delaware.	July 3, 19, '63.	Right. Died July 22, 1863, pyæmia.
2	Buehart, R., Pt., B, 151st Pennsylvania, age 30.	July 1, 8, '63.	Left. Died July 26, 1863, pyæmia.	10	Harrison, J., Pt., K, 71st Indiana.	Aug. 30, Se. 21, '62.	Left; (hæmorrhages.) Died Sept. 30, 1862, hæmorrhages.
3	Coleman, W. H., Serg't, F, 95th Pa., age 27.	May 2, 6, '63.	Died May 31, 1863, typhoid fever.	11	Heston, P. D., Corp'l, G, 62d Ohio, age 21.	July 18, 24, '63.	Left. Died August 20, 1863, pyæmia.
4	Culp, J., Pt., E, 95th Pennsylvania, age 29.	May 2, 6, '63.	Left. Died May 30, 1863, pyæmia.	12	Hickey, T., Capt., A, 164th N. Y., age 25.	June 3, 22, '64.	Right; by Surg. D. W. Bliss, U. S. V.; (June 3, ex. hum.; June 18, hæm.) Died July 6, '64, pyæmia.
5	Donnelly, E., Pt., C, 51st N. Y., age 29.	Sept. 17, Oct. 6, '62.	Right. Died November 7, 1862, pyæmia.	13	Hubbell, R., Pt., I, 11th Mass., age 23.	Aug. 29, Sept. 16, 1862.	Left; by A. A. Surg. S. D. Gross; (hæmorrhage.) Died Sept. 29, 1862; hæmorrhage. *Spec.* 2769.
6	Dyas, J. W., Pt., K, 51st Indiana.	De. 31, '62, Ja. 22, '63.	Left; (hæm'rhages and diarrhœa.) Died February 1, 1863.	14	Jacobs, C. W., Corp'l, B, 108th New York.	Dec. 13, 22, '62.	Left; by Surg. E. Bentley, U. S. V.; hæm'age. Died Dec. 28, '62.
7	Fuller, F., Pt., D, 12th Missouri, age 25.	May 22, Jun. 5, '63.	Right. Died June 20, 1863, pyæmia.	15	Jones, I, Pt., A, 143d Penn., age 28.	July 1, 15, '63.	Right; July 17, lig. of brachial; pyæmia. Died July 18, '63, hæm.
8	Gordon, J. W., Pt., G, 34th New York.	June 1, 11, '62.	By A. A. Surg. T. G. Morton. Died June 22, 1862, pyæmia.				

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
16	Lockard, J., Pt., D, 53d Ohio.	June 27, July 4, 1864.	Left; by A. Surg. D. J. Swartz, 100th Ind.; (June 27, excis. ulna; gangrene:) July 5, hæmorrhage gangrenous. Died July 6, 1864.
17	Lohre, G., Pt., D, 142d Penn., age 25.	July 1, 9, '63.	Right; also wound of back. Died July 31, 1863, pyæmia.
18	*Marsh, E. D.*, Pt., B, 18th Louisiana.	April 7, 10, '62.	Right; acute diarrhœa. Died May 10, 1862.
19	Martin, E., Pt., I, 2d Vermont.	Dec. 13, 29, '62.	Left. Died Jan. 10, 1863, pyæmia.
20	Margold, L., Pt., G, 33d New Jersey.	Nov. 25, Dec. 22, '63	Left. Died January 1, 1864, pyæmia.
21	Miller, H., A, 41st N. Y., age 20.	July 2, 20, '63.	Right. Died August 4, 1863, tetanus.
22	Miller, E., I, 46th N. Y., age 27.	Sept. 17, 26, '62.	Right. Died October 21, 1862, pyæmia.
23	Nero, F., Pt., I, 26th Wisconsin, age 23.	May 2, 6, '63.	Right. Died May 28, 1863, exhaustion.
24	Parliament, J., Pt., C, 13th New Jersey.	July 3, 18, '63.	Right; by Surg. H. E. Goodman, 98th Pa.; (excision July 4; hæm. July 16.) Died July 28, 1863.
25	*Petree, G.*, Pt., C, 33d N. C., age 41.	July 2, 7, '63.	Right; also pen. wound of side. Died July 26, 1863, tetanus.
26	Rhodes, M., Pt., H, 13th Penn. Cav., age 48.	Aug. 11, 16, '64.	By Dr. Gibbs; also fracture of clavicle. Died Aug. 29, 1864.
27	Rider, J. S., Pt., H, 24th Michigan.	July 1, 6, '63.	Left. Died July 18, 1863.
28	Rockwood, C. A., Pt., G, 15th Mass., age 21.	May 12, 16, '64.	Right. Died May 30, 1864.
29	Shaw, L. E., Pt., D, 12th Ill. Cav., age 26.	July 1, 9, '63.	Right. Died July 24, 1863, pyæmia.
30	Smith, I., Pt., G, 60th Ohio, age 19.	June 23, Jul. 11, '64	Left; June 23, excision of humerus. Died July 13, 1864.
31	Strober, L., Pt., A, 107th Ohio, age 30.	July 3, 16, '63.	Left. Died August 4, 1863, pyæmia.
32	Turner, E., Pt., D, 30th Col. Troops, age 18.	July 30, Au. 16, '64	Right. Died Sept. 23, 1864.
33	*White, H. P.*, Pt., G, 57th Virginia.	July 3, –, '63.	(Primary excision of elbow joint.) Died July 27, 1863.
34	Wilmoth, S., Pt., C, 67th New York.	May 27, Jun. 6, '62.	By A. A. Surg. M. Stovell. Died June 21, 1862, pyæmia.

Eight of the above cases were complicated by secondary hæmorrhage, seventeen succumbed to pyæmia, two died from tetanus, two from diarrhœa. In one case the brachial artery was unavailingly ligated. No autopsies were reported.[1]

The eight preceding tables enumerate nine hundred and two intermediary amputations of the arm with a mortality of 33.4 per cent.[2]

Secondary Amputations in the Continuity.—In four hundred and eleven, or about one-eleventh of the forty-five hundred and seventy-two cases of amputation of the arm in which the date of operation was precisely ascertained, the amputations were practised subsequent to the thirtieth day from the reception of the injury. The ratio of mortality was 27.7 per cent.—5.7 per cent. less than in the series of intermediary amputations, 9.3 per cent. greater than in the series of primary amputations of the arm in the continuity.

1. Secondary Amputations in the Upper Third of the Arm.—One hundred and seventy-three of the secondary amputations of the arm involved the upper third, and resulted in a fatality of 26.6 per cent. The operations were practised on one hundred and sixty-seven Union and six Confederate soldiers. In one hundred and twenty-two cases in which the mode of operation was specified, the circular method was adopted in sixty-six, the oval in ten, the flap in forty-six.

§ *Successful Cases.*—One hundred and twenty-seven of the secondary amputations at the upper third of the arm resulted favorably. The right extremity was interested in sixty-eight, the left in fifty-eight cases, this point being unnoted in one case. Twelve of the patients returned to modified duty, two were exchanged, and one hundred and thirteen discharged. In five cases the lesions were consequent on injuries inflicted by cannon shot, in one on injuries from the premature discharge of a cannon; in one hundred and twenty-one cases the antecedent injuries were believed to be produced by small projectiles. Forty-four of the patients had already undergone major operations, viz: Amputation of the opposite arm at the middle third in one case, of opposite forearm in one, of the same arm

[1] One case (No. 13), an instance of intermediary amputation for a shot comminution of the left ulna, with consecutive bleeding from the ulnar and interosseous arteries, supplied the Museum with *Specimen* 2769.—(*Cat. Surg. Sect.*, 1866, p. 189.)

[2] Observations on intermediary amputations of the arm for the effects of shot injury have been published: By Medical Cadet E. Cours, U. S. A. (*Med. and Surg. Reporter*, 1863, Vol. IX, p. 230); by Dr. G. H. Fisher (*Report of Amputations near Sharpsburg*, in *Am. Jour. Med. Sci.*, Vol. XLV, p. 49); by Surgeon J. H. Thompson, U. S. V. (*Am. Med. Times*, 1862, Vol. V, p. 7); by Surgeon J. Bryan, U. S. V. (*Am. Med. Times*, 1863, Vol. VII, pp. 4 and 287); by Surgeon A. B. Mott, U. S. V. (*Cases in Military Surgery*, in *Am. Med. Monthly*, 1862, Vol. XVIII, p. 348,—1 fatal and 2 successful cases); by Surgeon P. F. Eve, P. A. C. S. (*Surg. Memoirs by the U. S. Sanitary Commission*, 1870, Vol. I. p. 210); by Dr. A. E. M. Purdy (*Severe Case of Gunshot Wound*, in *Am. Med. Times*, 1862, Vol. V. p. 35); by Dr. W. H. Hess (*Chicago Med. Journal*, 1870, Vol. XXVII, p. 207); by Acting Assistant Surgeon T. T. Smiley (*Gunshot Wounds from Arkansas Post*, in *Boston Med. and Surg. Jour.*, 1863, Vol. LXIX. p. 154); by Surgeon N. Hayward, 20th Massachusetts (*Army Surgery on the Battlefield*, in *Boston Med. and Surg. Jour.*, 1862, Vol. LXV. p. 396).

at elbow joint in one, of the forearm of the same side in one, of excisions of the humerus of the same side in eighteen cases, of excisions of the elbow joint in thirteen cases, of excisions in the shafts of the bones of the forearm in five cases, of ligations of the brachial artery in two cases, of complex operations for neurotomy and extraction of balls and bone fragments in two cases. Five of the patients survived, moreover, operations subsequent to the secondary amputations of the arm, viz: Exarticulation at the shoulder in one case, resection of the protruding shaft of humerus in one, ligation of the axillary artery in one, and of the brachial artery in two cases. The course of convalescence was interrupted in nineteen cases by sloughing, in six cases by gangrene, and there were nine examples of copious but controllable consecutive bleeding. In one instance, grave symptoms of tetanus were temporarily manifested.

FIG. 547.—Lesions following an excision in the humerus for shot injury. *Sp.* 3209.

CASE 1690.—Private S. J. Call, Co. D, 32d Massachusetts, age 35 years, was wounded at Spottsylvania, May 12, 1864. Surgeon W. R. De Witt, U. S. V., recorded at the field hospital of the 1st division, Fifth Corps: "Right arm fractured by bullet." Assistant Surgeon P. C. Davis, U. S. A., in charge of Judiciary Square Hospital, at Washington, contributed the specimen (FIG. 547), with the following description of the case: "Gunshot wound of the lower third of the right humerus; a compound fracture. On September 8th, amputation at the upper third of the humerus was performed in this hospital by Acting Assistant Surgeon J. H. Thompson. A flap operation was chosen. Ether and chloroform were the anæsthetics used. The condition of the injured parts showed that an excision of the lower extremity of the humerus with the condyles had been performed upon the field, May 13th. A sequestrum several inches in length was found embedded in the callus, and a portion of the shaft of the humerus necrosed. The soft parts were much inflamed and in an unhealthy condition. The constitutional state of the patient was moderately good. The treatment consisted of stimulants. September 30th, patient rapidly improving." The specimen consists of the upper extremity of the bones of the right forearm and the lower two-thirds of the humerus. The radius and ulna do not appear to have been directly injured, but are carious and partly absorbed, and have united at their adjoining borders. A loose sequestrum of six inches lies within a partial involucrum of spongy bone, the osseous deposit extending nearly to the point of amputation. The patient was discharged from service on January 5, 1865, and pensioned. In his application for commutation, dated 1870, he stated that the condition of the stump was "healthy." He was paid on June 4, 1875.

FIG. 548.—Lower part of humerus amputated two months after shot comminution. *Spec.* 1917.

CASE 1691.—Private J. Siler, Co. E, 38th Illinois, aged 22 years, was wounded at Chickamanga, September 19, 1863, in the casualty list of which battle his injury was described by Surgeon G. Perin, U. S. A., Medical Director of the Army of the Cumberland, as follows: "Both arms wounded; left fractured." With a number of others the wounded man fell into the hands of the enemy, where he remained until October 6th, when he was received into Hospital No. 2, at Chattanooga. Assistant Surgeon J. C. Norton, U. S. V., in charge of the hospital, reported: "Compound fracture of left humerus, lower third. Treated with felt splints and cold-water dressings. The splints could not be well adapted on account of extensive laceration of the soft parts, which presented large fungous granulations. In consequence the bones united at an angle. A large callus is thrown out, however, and the deformity will not be great. There is partial anchylosis of the elbow joint. Patient was sent to Stevenson, Ala., on November 7th, in good condition." On November 11th, the patient reached Hospital No. 1, at Nashville, whence Acting Assistant Surgeon P. Peter furnished the following history: "When admitted, his wound, a compound comminuted fracture of the left humerus, produced by a ball, had not been dressed for forty-eight hours, and consequently was offensive, somewhat inflamed and irritated, and discharging pus freely. The tissues immediately around the fracture presented an uncomely appearance, being bulged out all around, and superabundant granulations at the external openings, of which there were three or four distinct ones. On examination with a probe I detected several fragments of bone, two or three of which, as large as a grain of Indian corn, I removed with the small forceps without enlarging the openings. The patient was stout and his general health good. I applied simple water dressings, and gave him full diet. November 19th, patient has been doing moderately well till to-day, having rested well all the time; appetite kept good and bowels regular. To-day the tongue is coated with a white fur; appetite poor and bowels constipated; patient generally restless. Arm inflamed and swollen, with small blisters about the fracture. Cheeks flushed, and pulse 90. Prescribed castor oil ℥ss, also a mixture of spirit. nitre and spirit. mindereri āā ℥ss, tart. antim. gr. 1, in doses of a teaspoonful every two hours, and half diet. November 20th, patient has not rested much; the wound and surrounding tissues are covered with large blisters, of puffy condition and of a gangrenous appearance; pus fœtid; tongue still coated; appetite poor; pulse 100, and patient weak at times. On consultation with Surgeon C. W. Hornor, U. S. V., in charge of the hospital, in the afternoon, it was deemed advisable to amputate the arm immediately. Accordingly at 4 P. M. the patient was put under the influence of an anæsthetic, which he bore well, and I performed the circular amputation at the upper third of the humerus,

being the most distal point at which sound tissue could be had. The patient bore the operation well, and, after he was thoroughly from under the influence of the anæsthetic, he rested quietly and slept very well through the night. November 21st, tongue still a little coated. Pulse about 100, but patient rests well and his appetite improved; stump looks well, and but little inflamed. Treatment: Simple water dressings, and wine ℥i every three hours, with nourishing diet. November 22d, patient rested well through the night and is cheerful this morning. The wound or stump is a little more inflamed, and has slight appearance of erysipelas. Appetite moderate; pulse 112, soft and full. Prescribed tinct. iron gtts. xx, and quinine gr. iss, every three hours, and applied glycerine locally. November 23d, patient rested well through the night and is cheerful this morning; appetite good; tongue cleaning off; less appearance of erysipelas; wound beginning to suppurate; pus a little fœtid; pulse 112. Treatment continued, with the addition of chlor. sodæ. November 24th, patient rests well; tongue clean; appetite good; less feverish; pulse 100; wound suppurating freely. I removed half the stitches and applied a poultice of flaxseed and charcoal. Continued iron and wine and good diet. November 25th, patient rested well through the night; appetite good; wound suppurating freely; pus fœtid; good deal of tenderness about the shoulder joint on handling the parts; pulse 90; excretions regular. The general health of the patient is good." The specimen (FIG. 548) was contributed to the Museum by the operator, and consists of "the lower half of the left humerus, showing a nearly transverse fracture in the lowest third, with a splinter of nearly two and a half inches broken off the inner border of the upper fragment. A considerable effusion of callus has partially united the fragments, with some displacement to the upper portion, but no union of the broken shaft has occurred." On April 1, 1864, the patient was transferred to hospital at Louisville, subsequently to Madison, and lastly to Camp Chase, where he was discharged from service on August 30, 1864, and pensioned. Examiner R. T. Higgins, of Vandalia, January 6, 1875, certified: "The left arm is amputated about two and a half inches below the shoulder joint. The cicatrix of the wound of the right forearm is very tender. Development of arm very good, but seems weak in grasping. Cannot carry any weight any distance in hand or on arm, etc." The pensioner was paid on June 4, 1875.

TABLE LXXXIV.

Condensed Summary of One Hundred and Twenty-seven Cases of Recovery after Secondary Amputations in the Upper Third of the Shaft of the Humerus.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Allen, R., Pt., G, 37th Indiana.	De. 31,'62 Ja. 31,'63.	Right; by Surg. R. G. Bogue, 19th Ill. Disch'd Mar. 15,'63; pens'd.	22	Coleman, C. T., Corp'l, B, 75th New York, age 23.	June 14, Aug. 7, 1863.	Right; flap; by A. Surg. W. S. Webster, 156th N.Y.; (exc. June 15,'63.) Disc'd Apr. 7,'64; pens'd.
2	Banks, J. H., Corp'l, E, 13th Maine, age 27.	M'y15,'64 July 8, 1866.	Right; flap; by Dr. W. H. True; (excis. humerus May 21, 1864.) Disch'd Oct. 19, 1864; pens'd.	23	Coleman, H., Emp. Q.M. Dept., age 24.	Mar. 16, Ap. 16,'65	Right; circ. Transferred June 5, 1865.
3	Beebe, S. M., Pt., H, 4th Michigan Cavalry.	De. 15,'62 1866.	Right. Discharged Sept. 3,'63; pensioned.	24	Collins, A., Pt., K, 14th Kentucky.	June 22, 1864, Mar., '65.	Left; by Drs. H. S. Sivetnam, E. R. Turner, and J. Roland; (excision June 22, 1864.) Discharged January 31, 1865; pensioned.
4	Belt, G., Pt., K, 5th New Jersey, age 25.	May 5,'62 April 11, 1863.	Right; flap; by A. Surg. C. R. Greenleaf, U.S.A. and A.A. Surg. C. R. Maclean; (excis. humerus May 6.) Disc'd Oct. 1,'63; pens'd.	25	Conner, J., Pt., F, 3d Delaware, age 15.	Feb. 2, May 26, 1863.	Left; by Surg. D. E. Wolfe and A. Surg. J. M. Houston, 3d Del.; (amp. right forearm Feb. 2.) Discharged Nov. 12, 1863; pensioned.
5	Berry, H., Government employ6, age 57.	Nov. 5,'64 Ja. 19,'65.	Right; circ.; by Surg. J. Perkins, U.S.V.; (gang.) Disc'd May 9,'65.				
6	Best, R., Private, A, 83d Pennsylvania.	Aug. 30, Sept. 30, 1862.	Left; by A. A. Surgs. C. C. Tower and C. B. Fry. Disch'd March 30, 1863; pensioned.	26	Cotton, A., Pt., F, 22d Massachusetts, age 25.	June 27, Au. 16,'62	Left; circ.; by Surg. A. B. Mott, U.S.V. Dis'd Nov. 1,'62; pens'd.
7	Bicknell, J. T., Serg't, K, 22d Mass., age 44.	June 27, Sep. 3,'62.	Right; flap; by Med. Cadet F. A. Keffer, V.R.C. Aug. 20,'63; pen'd.	27	Crites, W. M., Corp'l, B, 10th W. Va., age 26.	July 24, Au. 24,'64	Right; circ.; by a Confed'e surg. Dis'd Aug. 9, 1865; pensioned.
8	Bird, W. A., Pt., G, 68th Indiana, age 32.	Aug. 14, Sept. 15, 1864.	Left; circ.; by A. A. Surg. A. Robillard; (hæm.; lig. of brachial.) Disch'd Nov. 26, 1864; pens'd.	28	Dark, A. M., Pt., C, 1st New Jersey.	May 3, June 26, 1863.	Right; by A. A. Surg. D. P. Wolhaupter. Discharged August 10, 1863; pensioned. *Spec.* 1312.
9	Birge, W. C., Pt., G, 37th Massachusetts.	June 6, Au. 13,'64	Left; (amp. of forearm June 19; gang.) Disc'd Feb. 28,'65; pen'd.	29	Davis, T., Pt., C, 30th Iowa, age 21.	July 2, Aug. 8, 1864.	Right; ant.-post. flap; by A. A. Surg. J. C. Thorpe. Discharged March 20, 1865; pensioned.
10	Bishop, H., Pt., K, 22d Michigan, age 21.	Sept. 20. Oct. 26,'63	Left; circ.; by A. A. Surg. W. K. Mairty. Dis'd June 30,'65; pen'd.	30	Davis, W. S., Pt., C, 33d Maine.	May 12, Au. 11,'64	Right; flap; by Dr. E. White. Disch'd Nov. 29, 1864; pensioned.
11	Bower, W. H., Serg't, L, 1st New York Light Artillery.	Aug. 21, 1862. Second'y.	Left; (amp. elbow jt. Aug. 21,'62.) Disch'd Nov. 10,'62. Re-enlisted, and disch'd Aug. 2,'71; pens'd.	31	Dennis, J., Pt., D, 3d New Jersey.	May 8, July 3,'64	Left; by Dr. T. Ryerson. Discharged June 27,'64; pensioned.
12	Bowman, J., Serg't, B, 54th Penn., age 29.	June 21, July 27, 1864.	Right; circ.; by Surg. W. S. Welsh, 15th W. Va. Disc'd Oct. 27,'64; pensioned.	32	Dilley, L. L., Pt., D, 22d Illinois, age 23.	Jan. 20, Feb. 23, 1864.	Circular; by A. Surg. J. E. Link, 21st Ill.; (gangrene.) Discharged July 7, 1864; pensioned.
13	Bozier, H., Pt., K, 91st Penn., age 18.	June 19, July 21, 1864.	Right; flap; by Surg. N. R. Moseley, U. S. V. Disch'd May 27, 1865; pensioned. *Spec.* 2893.	33	Doyle, P., Pt., D, 69th New York.	Sept. 17. Dec. 4, 1862.	Right; flap; by Surg. H. S. Hewit, U.S.V.; (excision October 2, and again Dec. 4.) Discharged Feb. 5,'63; pens'd. *Specs.* 458, 807.
14	Brown, J. W., Pt., B, 97th Ohio, age 20.	May 26, July 10, 1864.	Left; circ.; by Surg. S. E. Fuller, U. S. V.; (excis. May 26, 1864.) Disch'd Jan. 10, 1865; pens'd.	34	Erdman, C. W., Serg't Maj., 121st O., age 22.	De. 24,'63. Mar. 9,'64	Left; flap; by Dr. C. B. Cliff. Disch'd Apr. 23, 1864; pensioned.
15	Brown, T., Pt., C, 1st Mass. H. A., age 50.	J'e 21,'64. Feb. 12,'67	Left; circ.; by Dr. I. F. Galloupe. Disch'd July 3, 1865; pens'd.	35	Fehls, G., Pt., G, 12th Missouri.	July 17, Au. 20,'63	Discharged August 7, 1864; pensioned.
16	Bumgardner, M., Serg't, B, 9th Iowa.	May 22, Oct. 2. 1863.	Right; circ.; by A. Surg. H. R. Tilton, U. S. A.; (hæm.; gang.) Disch'd Dec. 3, 1863; pens'd.	36	Finkbone, J., Pt., B, 124th Ind., age 45.	June 2, Aug. 1, 1864.	Right; circ.; by Dr. W. H. Twiford; (excision June 3.) Disch'd May 8, 1865; pensioned.
17	Burns, J. R., Corp'l, C, 74th New York.	May 5, J'e 5,'62.	Right; by Surg. A. B. Mott, U. S. V. Discharged; pensioned.	37	Force, C. A., Pt., K, 60th New York, age 20.	Jul. 25,'64 1870.	Right; by Dr. J. S. Green; (excision July 25, 1864.) Discharged Aug. 31,'65; pens'd. *Spec.* 1805.
18	Call, S. J., Pt., D, 32d Mass., age 35.	May 12, Sept. 8, 1864.	Flap; by A. A. Surg. J. H. Thompson.; (exc. May 13; necro.) Dis'd Jan. 5, 1865; pens'd. *Spec.* 3209.	38	Fries, A., Corp'l, E, 100th Illinois, age 26.	Sept. 19, Oct. 31, 1863.	Right; circ.; by Surg. A. McMahon, 64th Ohio; hæmorrhage. Disch'd April 18, 1864; pens'd.
19	Chamberlain, J. A., S'g't, D, 6th Maine, age 28.	May 11, June 22. 1864.	Left; circ.; by A. A. Surg. C. Carvallo. Disch'd Dec. 28, 1864; pensioned. *Spec.* 3567.	39	Frohne, C., Pt., B, 32d Indiana, age 35.	May 27, July 27, 1864.	Left; flap; by A. A. Surgeon E. G. White; (hæmorrhage.) Disch'd January 28, 1865; pensioned.
20	Chapman, E. T., Corp'l, E, 58th Mass.	June 2, Au. 15,'64	Left; circ.; by Dr. J. H. Hodges. Disch'd April 11, 1865; pens'd.	40	Fulmore, J. C., Pt., I, 21st Iowa.	May 22, J'e 25,'63.	Right. Discharged August 25. 1863.
21	Chase, D. W., Pt., D, 36th Mass., age 21.	J'e 3,'64. Nov. 8, 1866.	Left; by Dr. A. R. Gleason; (exc. humerus June 18, 1864.) Disch'd June 22, 1865; pensioned.	41	Gallagher, W., Pt., K, 6th Iowa, age 25.	J'e 27,'64. April 8, 1865.	Left; flap; by Surg. M. K. Taylor, U. S. V.; (excis. June 27; gang.) Disch'd July 26, 1865; pens'd.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
42	Gentzsch, E., Serg't Major, 98th Pa., age 30.	M'y18,'64 Dec. 21, 1868.	Left; circular; necrosis. Disch'd June 19, 1865; pensioned. Removal of necrosed bone.
43	Glenn, D. M., Pt., K, 1st Pa. Rifles, age 26.	Dec. 13, 1862, April 20, 1863.	Right; flap; by Surg. H. Bryant, U.S.V.; (exc. Dec. 17, '62, follo'd by gangrenous ulcerations.) To V. R. C. Sept. 9, '63. *Spec.* 1066.

45	Harsh, G. H., Pt., A, 7th W. Va., age 34.	May 12, June 23, 1864.	Right; circ.; by A. Surg. A. Ingram, U. S. A. Duty Aug. 20, 1864; pensioned.
46	Heath, B. F., Pt., A, 6th Connecticut.	May 20, 1864, Mar. 22. 1865.	Left; flap; by A. A. Surg. T. B. Townsend. Bone sawn off at surgical neck March 26, 1865. Discharged May 23, 1865; pens'd.
47	Hess, B. E., Lieut., D, 3d Michigan.	Au. 29, '62 Mar., '63.	Left; by Dr. H. H. Palmer; (also wound of lung.) Disch'd May 20, 1863; pensioned.
48	Hetts, C., Pt., B, 7th Michigan, age 18.	June 22, July 29, 1864.	Circular; by A. A Surg. L. E. Nordman; (excis. June 22, '64.) Disch'd June 16, '65; pensioned.
49	Hilton, A. L., Pt., H, 1st Maine Cav., age 22.	Sept. 29, Nov. 3, 1864.	Flap; by A. A. Surg. J. F. Thompson. Discharged June 8, 1865; pensioned. *Spec.* 3383.
50	Hilton, F. J., Pt., M, 13th Pa. Cav., age 20.	May 30, July 6, 1864.	Right; circular; by Surg. N. R. Moseley, U.S.V.; (excision May 30.) Discharged Sept. 24, 1864; pensioned. *Spec.* 2817.
51	Henson, J., Capt., D, 33d Ohio.	Sept. 20, Oc. 23, '63.	Left; circular; by A. Surg. T. B. Hamilton. Duty Jan. 23, 1864.
52	Hodges, F., —, A, 3d Michigan.	May 31, Jul. 17, '62	Left; by A. A. Surg. C. G. Page. Disch'd Aug. 23, '62; pensioned.
53	Holland, J., Pt., C, 137th New York, age 38.	July 2, Aug. 8, 1863.	Right; (excision ulna July 21; mortification ensued.) Disch'd Oct. 19, 1863; pensioned.
54	Hollister, O. H., Corp'l, I, 10th Pa. Reserves.	June 27, Aug. 9, 1862.	Left; circular; by A. A Surg. J. O. French; (excision July 21.) Disch'd Sept. 12, '62; pensioned.
55	Hoover, S., Pt., B, 21st Illinois.	Sept. 19, Nov. 12, 1863.	Right; ant-post. flap; by A. Surg. C. F. Haynes, U. S. V. Discharged March 9, '64; pensioned.
56	Houghland, J., Pt., K, 59th Indiana.	May 22, J'e 29, '63.	Right; by Dr. Leslie. Discharged Sept. 2, 1863; pensioned.
57	Huber, J., Pt., B, 51st New York, age 31.	May 5, J'e 11, '64.	Right; circ.; by Surg. A. F. Sheldon, U.S.V. Disch'd Apr. 9, '65.
58	Johnston, D., Pt., F, 103d Penn., age 23.	De. 14, '62 Jan. 30, 1863.	Right; by Surg. C. Haddock, 8th Mass.; (excision Jan. 13.) Discharged Nov. 25, '63; pensioned.
59	Jordi, C., Pt., A, 16th Michigan, age 39.	June 27, July 29, 1862.	Left; circ.; (excision.) Dis'd Sept. 5, '63; pensioned. *Spec.* 433. Died Jan. 6, 1869, hæm. from lungs.
60	Kelly, J., Pt., G, 5th Cavalry, age 40.	Se. 19, '64, Jan. —, 1866.	Right; by Dr. Lewis; (exc. Sept. 20, 1864; also wound of thorax;) lig. of axillary. Disch'd April 17, 1865; pensioned.
61	King, G. W., Pt., K, 26th Illinois.	Au. 14, '64 Ap. —, '65	Right; by Surg. J. R. Ludlow, U. S.V. Dis'd Aug. 16, '65; pens'd.
62	Kissinger, A. L., Pt., B, 18th Infantry, age 21.	Aug. 7, Se. 15, '64.	Left; flap; by A. A. Surg. J. C. Thorpe. Duty Aug. 24, 1865; pensioned.
63	Laken, D., Pt., D, 18th Infantry.	De. 31, '62 Feb. 11, 1863.	Left; flap; by Surg. W. P. Johnson, 18th Ohio. Disch'd March 18, 1863; pensioned.
64	Lamphere, G. N., Pt., B, 16th Conn., age 19.	April 20, May 22, 1864.	Left; circ.; by Surg. E. B. Haywood, U. S. A. Disch'd Feb. 28, 1865; pensioned.
65	Langdon, W. H., Corp'l, F, 12th Illinois.	Oct. 3, No. 19, '62	Right. Discharged Jan. 2, 1863; pensioned. *Spec.* 1032.
66	Lauer, P., Serg't, A, 82d Illinois, age 44.	May 25, Jul. 2, '64.	Left; circ.; by Surg. J. K. Rogers, U.S.V. Dis'd June 9, '65; pen'd.
67	Legrange, J., Pt., H, 103d N. Y., age 39.	Sept. 17, Oct. 23, 1862.	Right; circ.; by A. A. Surg. A. A. Hines. Disch'd Nov. 26, 1862; pensioned. *Spec.* 401.
68	Lewis, R., Pt., G, 83d Indiana.	De. 28, '62 Feb. 8, 1863.	Left; by Asst. Surg. C. T. Alexander, U. S. A. Discharged March 24, 1863; pensioned.
69	Limaberry, O. H., Pt., G, 45th Ohio.	Nov. 18, De. 23, '63	Right; flap. Discharged April 27, 1864.
70	Lombard, H., Pt., F, 40th Mass., age 31.	May 16, Se. 2, '64.	Left; circ.; by A. A. Surg. W. C. Peyer. Dis'd Jan. 12, '65; pens'd.
71	Long, D. B., Serg't, H, 61st Ohio, age 36.	July 20, Se. 17, '64.	Right; circ.; by A. Surg. T. A. McGraw, U.S.V. Duty April 17, '65.
72	Marks, J. C., Pt., D, 149th Penn., age 28.	May 10, Oct. 19, 1864.	Right; flap; by Surg. J. A. Lidell, U.S.V.; (3 in. median nerve exc. Oct. 6, '64.) Disch'd May 27, '65.
73	Marshall, D., Lieut., A, 3d N. H., age 24.	Jan. 15, July 4, 1865.	Right; by A. Surg. G. W. Manter, 3d N. H.; (exc. Jan. 15.) Disch'd July 20, 1865; pensioned.
74	Martin, J., Pt., E, 91st New York.	May 27, Jul. 14, '63	Left. To Vet. Res. Corps August 10, 1863; pensioned.
75	*Martin, J. T.*, Pt., K, 6th Virginia, age 21.	July 30, Oct. 5, '64.	Right; flap; by A. Surg. S. H. Orton, U.S.A. To prison May 9, '65.
76	McGrath, W., Corp'l, D, 96th New York, age 30.	June 16. Oct. 8, 1864.	Right; circ.; by Asst. Surg. Wm. St. G. Elliott, U. S. V. Disch'd May 20, 1865; pensioned.
77	McIntyre, J., Pt., G, 2d Michigan.	No. 24, '63 Mar. 4, 1865.	Right; by Dr. W. W. Anderson; (excis. Nov. 24, 1863.) Disch'd June 8, 1864; pensioned.
78	McLain, J., Pt., F, 16th Infantry.	Jan. 1, Mar. 3, '63	Right. To Veteran Reserve Corps October 29, 1863.
79	McQuade, D., Pt., B, 90th Ohio, age 27.	May 14. Jul. 1, '64.	Left; circ.; (excis. May 14, 1864.) Disch'd March 17, 1865; pens'd.
80	Miller, J. W., Pt., D, 32th Ohio, age 37.	July 24, Au. 29, '64	Right; by Surg. J. C. Denice, 27th Ohio. Disch'd June 26, 1865; pensioned.
81	Miller, R. R., Corp'l, D, 4th Minnesota.	M'y 22, '63 Oct. —, 1864.	Right; by Dr. J. H. Murphy; (exc. June, 1863.) Disch'd October 22, 1863; pensioned.
82	Mitchener, B., Serg't, E, 4th Delaware, age 39.	June 22, July 23, 1864.	Right; circular; by A. A. Surg. J. Newcombe. Disch'd March 18, 1865; pensioned.
83	Mulville, M., Pt., A, 10th Wisconsin, age 20.	Sept. 20, Oc. 30, '63.	Left; by Surg. W. M. Wright, 79th Pa. Disch'd June 24, '64; pen'd.
84	Murray, J. M., Serg't, E, 22d Illinois.	No. 25, '63 Ap. 2, '64.	Left; by Surg. J. E. Herbst, U.S.V. Discharged and pensioned.
85	Myers, T. D., Pt., D, 118th Ohio, age 20.	May 14, July 10, 1864.	Right; circ.; by A. A. Surg. John Sloan; (gangrene.) Discharged Dec. 14, 1864; pensioned.
86	Morton, W., Pt., K, 123d New York.	July 3. Au. 3, '63.	Left; by A. A. Surg. G. H. Dare. Disch'd Oct. 17, 1863; pens'd.
87	Pearson, J., Pt., C, 32d Missouri.	Dec. 4, '62, Jan. 4, '63.	Left; by A. A. Surg. W. S. Dyer. Disch'd March 4, 1863; pens'd.
88	Perry, J. M., Pt., D, 40th Mass., age 40.	June 18. Jul. 21, '64	Circular; by A. A. Surg. W. P. Moon. Dis'd Dec. 12, '65; pens'd.
89	Perry, O. H., Pt., C, 97th Illinois, age 33.	April 9, 1865. Second'y.	Right; (exc. June 12, 1865; bone became diseased.) Discharged October 18, 1865; pensioned.
90	Place, J. W., Pt., D, 13th N. H., age 19.	June 15. Jul. 23, '64	Right; flap. To Vet. Res. Corps December 20, 1864; pensioned.
91	*Powell, E.*, Pt., E, 15th Mississippi, age 32.	No. 30, '64 Jan. 2, 1865.	Left; ant.-posterior flap; by Surg. Voorhies, C. S. A. Transferred March 31, 1865.
92	Quinn, J. W., Corp'l, E, 18th Ohio.	Jan. 2, Feb. 13, 1863.	Right; by Surg. W. P. Johnson, 18th Ohio. Discharged March 31, 1863; pensioned.
93	Rackliff, B. R., Pt., I, 7th Minnesota.	July 14, Se. 17, '64.	Left; by a Confederate surgeon. Discharged and pensioned.
94	Raser, T., Pt., I, 9th Ill. Cavalry.	July 12, Au. 26, '64	Right; by a Confederate surgeon. Disch'd Feb. 13, 1865; pens'd.

127	Wood, J., Corp'l, D, 27th Mass., age 31.	May 16, Au. 4,'64.	Left; circular; by a Confed. surg. Disch'd June 20, 1865; pens'd.

Specimens from nineteen of the foregoing cases of successful secondary amputations in the upper third of the shaft of the humerus are preserved in the Museum.[1]

§ *Fatal Cases.*—There were forty-six fatal cases in the series of secondary amputations of the arm at the upper third,—twenty-one on the right, twenty-four on the left, and one in which this point was not ascertained. Eleven of the patients had already submitted to grave operations,—one to amputation of the opposite arm, three to excisions of the shaft of the humerus, five to excisions of the elbow joint of the arm finally amputated, one to an extirpation of a portion of the ulnar nerve, and one to a ligation of the brachial.

Case 1692.—Private H. Wilson, Co. G, 27th Ohio, was wounded at Corinth, October 4, 1862. The injury was described on the casualty list of the 2d Division of the Army of the Mississippi, by Surgeon I. L. Crane, 62d Ohio, as: "Wound of arm; serious." Assistant Surgeon J. P. Wright, U. S. A., contributed the specimen (Fig. 549), with the following history: "A conoidal ball entered the right elbow joint between the internal condyle and the olecranon process. The missile was extracted, three months after the reception of the injury, from the outer surface of the arm, midway between the elbow and the shoulder. This man was transferred from Corinth to the general hospital at Jackson, on December 13th. On January 29th, the arm was attacked with severe erysipelatous inflammation, upon the subsidence of which—February 6th—the limb was amputated a little below the surgical neck. The man survived the operation eleven days, and sank with colliquative diarrhœa." The specimen consists of "the lower half of the right humerus and upper portion of the bones of the forearm. * * The head of the radius has nearly disappeared under absorption following fracture. The ulnar processes are not distinguishable, but several splinters are irregularly attached by callus to the extremity of that bone. The lower extremity of the humerus was comminuted; fragments covered with foliaceous callus are partially attached in irregular positions, and the extremity of the main body of the shaft is carious."—(*Cat. Surg. Sect.*, 1866, p. 173.) In setting up the preparation a section, several inches in length, of the upper portion of the diaphysis has been removed.

Fig. 549.—Ulterior consequences of a shot perforation of the right elbow. *Spec.* 969.

Fig. 550.—Ball impacted in humerus, ten months after injury. *Spec.* 2069.

Case 1693.—Private J. Kramer, Co. D, 72d New York, aged 20 years, was wounded at Williamsburg, May 5, 1862. Brigade Surgeon D. W. Bliss reported the injury on the casualty list as a "Wound of the left arm." On May 9th, the man was admitted to Hygeia Hospital, Fort Monroe, and, on October 2d, he entered Chester Hospital. It was decided that the condition of the limb necessitated amputation, which was performed at the upper third, by Acting Assistant Surgeon J. A. Draper, on February 16, 1863. Death resulted on February 25, 1863, from pyæmia. The specimen (Fig. 550) was contributed by the operator, and consists of "the lower thirds of the left humerus, amputated forty-one weeks after fracture, at their junction. The shaft is fairly consolidated, with slight deformity, but the interior, in which is lodged a battered bullet, is carious."—(*Cat. Surg. Sect.*, 1866, p. 131.)

[1] Two are shown in Figs. 547, 548. One (No. 1805) is a plaster cast of a flail-like dangling arm. Two (Nos. 1066 and 1032) are wet preparations of much interest, showing the remote alterations after excision and after comminution in the shaft. Fourteen show various morbid processes in bone after injury. The numbers of the specimens are recorded in the Table.

One of the patients submitted to re-amputation at the shoulder joint, and five to ligations—of the axillary in one case, of the brachial in three, and of a smaller trunk, probably the superior profunda, in one. Four patients had received serious wounds in other parts of the body, less grave, however, than the injuries of the arm. One patient perished from tetanus, three succumbed to colliquative diarrhœa, the majority to surgical fever and pyæmia.[1] Nine of the cases were complicated by intercurrent hæmorrhage, five by the invasion of erysipelas, and nine by gangrene.

CASE 1694.—Sergeant H. Herpst, Co. H, 119th Pennsylvania, aged 25 years, was wounded at the Wilderness, May 5, 1864, and admitted to the field hospital of the 1st division, Sixth Corps, where Surgeon R. Sharpe, 15th New Jersey, noted: "Fracture of lower third of humerus by minié ball." Surgeon G. L. Pancoast, U. S. V., in charge of Findlay Hospital, Washington, where the patient was admitted on May 11th, contributed the specimen (FIG. 551), with the following report: "Gunshot wound of the right arm, ball entering near elbow and having its exit on the inner side of the arm, about two inches below the axillary space, fracturing the humerus. The parts having become unhealthy and sloughing, amputation was performed, on June 7th, by flap method, at the upper third of the humerus, by Acting Assistant Surgeon D. P. Wolhaupter. Chloroform was given as an anæsthetic. Progress was unfavorable. The artery sloughed off, necessitating ligation of the axillary, which was practised by Acting Assistant Surgeon J. C. Nelson on June 13th. The treatment consisted of tonics, stimulants, and nutritious diet. Death occurred on June 15, 1864." The specimen consists of "the lower two-thirds of the right humerus, with a nearly transverse fracture in the lowest third. There was no comminution, but both extremities are necrosed, without attempt at repair."—(*Cat. Surg. Sect.*, 1866, p. 129.) There is no mention of an autopsy.

FIG. 551. — Necrosis after slightly oblique shot fracture of the humerus. *Spec.* 2463.

FIG. 552.—Humerus amputated three months after shot fracture. *Spec.* 2190.

CASE 1695.—Private *A. Bradford*, Co. B, 28th Alabama, aged 22 years, was wounded at Mission Ridge, November 24, 1863, and was treated in hospital at Chattanooga, for gunshot fracture of the right arm, until February 15, 1864, when he was transferred to Hospital No. 1, Nashville. Surgeon Caleb W. Hornor, U. S. V., reported: "Admitted to the prison ward February 16th. When admitted, he was suffering from profuse purulent discharge from the arm; appetite poor; tongue coated. On examination of the wound several spiculæ were found, and no union had taken place. February 25th, Acting Assistant Surgeon T. G. Hickman performed a flap amputation near the shoulder joint. Patient did not bear the operation well, but rallied in the course of twenty-four hours. February 28th, symptoms of pneumonia set in, and the patient continued very restless, and died on the morning of the 2d of March. The treatment had consisted of simple dressings to the stump, with anodynes and stimulants internally, and supporting and easily assimilable diet. Examination twelve hours after death: External appearance, moderate emaciation. On examination of the stump the tissues were found gangrenous, and a sinus was found to extend over the head of the humerus, but not communicating with the glenoid cavity. Nearly the whole of the left lung was in the stage of gray hepatization. The lower lobe of the right lung was deeply engorged. The heart contained large light yellow clots. There was fatty infiltration of the liver, which weighed three pounds and six ounces. The spleen was soft and pulpy, and weighed five ounces. Kidneys healthy; the right weighed four and a half, and the left five ounces." The specimen (FIG. 552) exhibits "an ununited fracture of the lowest third of the right humerus, amputated three months after injury. The specimen shows small fragments of bone thinly coated with callus and attached to the extremities. The middle third of the shaft is necrosed."—(*Cat. Surg. Sect.*, 1866, p. 131.) It was contributed to the Museum by Acting Assistant Surgeon G. P. Hachenberg.

Remarks.—As indicated in the TABLE, the cases of fatal primary amputation of the upper third of the arm furnished the Museum with twenty pathological specimens. Four are figured in the immediately preceding wood-cuts, and one on page 649 *ante* (FIG. 499). Of the fifteen remaining specimens, three (*Specs.* 4033, 4056, and 4095) are wet preparations, from the case of Knox (No. 24 of the TABLE), and are, respectively, an excised neuroma of the median nerve, a dissection of the median and ulnar nerves with slight fusiform enlargements, and the soft tissues removed *post-mortem* from the stump of the upper arm, showing nearly complete union, with a beautiful linear cicatrix and a bulbous enlargement of the nerves just behind the cicatrix. Two (*Specs.* 2638, 2667) are from the case of Crooker (No. 11), and consists of the comminuted and necrosed lower portion of the humerus, and of its upper portion rarefied and eroded by periostitis and osteomyelitis. *Spec.* 1928 is the fractured and carious metacarpus and carpus from the case of Tucker (No. 41); *Spec.* 2776 is the fractured ulna and diseased radius from the case of Barkhuff (No. 4); *Specs.* 1215 and 3756 show different stages of diseased stumps, from the cases of Shaw and Brint (Nos. 37 and 8)—one with a tubular sequestrum and involucrum densely studded with osteophytes, the other with an incipient annular exfoliation. *Spec.* 3667 is the fissured and necrosed lower thirds of the humerus, amputated on account of secondary hæmorrhage, in the case of Kleckner (No. 23); *Specs.* 2767, 2784, 2950, 3610, and 2836, from the cases of Fleckinger, Riggle, Logan, Perry, and Austin, are fine examples of mingled reparative and destructive processes succeeding shot fracture at the shoulder joint. The last exemplifies a firm bony anchylosis. Including the case of Bradford (CASE 1695), minutes of autopsies are preserved in seven

[1] The immediate causes of death are noted as: Tetanus, 1; diarrhœa and dysentery, 3; gangrene, 1; tubercular phthisis, 1; pneumonia, 4; pyæmia, 19; irritative fever and exhaustion, 17.

instances: In the case of Ackerman (No. 2 of the TABLE), Dr. Grant reports that "the necropsy revealed pus in the shoulder joint, two large metastatic foci in the liver, and one in the lower lobe of the right lung." In Brint's case (No. 8, *Spec.* 3756), Dr. A. C. May records: "Abscesses from face of stump to axillary space; the medullary tissue of the humerus was broken down and softened; the posterior portions of both lungs were studded with light grayish nodules; the posterior portions showed red hepatization; the supra renal capsules and spleen were much softened and disorganized." In the case of Cole (No. 10), Dr. J. W. Cushing observes: "Three-fourths of an ounce of purulent exudation of the left shoulder joint. The other joints were healthy, and the pulmonary parenchyma and pleural cavities normal." In Crooker's case (No. 11, *Specs.* 2638 and 2667), Dr. H. M. Dean noted: "At *post-mortem* examination the right shoulder joint was found filled with pus; the upper extremity of the humerus denuded of periosteum. The tissues of the stump were infiltrated with pus, but the veins leading from the parts showed no evidence of disease." In the case of Satterfield (No. 36), Dr. B. B. Miles reported that "the autopsy revealed a few minute abscesses in the right lung; the liver was softened but presented no purulent foci." In Tucker's case (No. 41, *Spec.* 1928), Dr. W. H. Matlock found, on *post-mortem* examination, "the arachnoid cavity distended with serum. Both lungs were congested at the bases and contained a few hard isolated tubercles in the upper lobes. Heart healthy. Parts of the surface of the liver were mottled with light yellow spots which resembled, when incised, incipient abscesses; the viscus weighed four pounds. The kidneys were much elongated. The shoulder, knee, and ankle joints contained viscid ill-conditioned pus."

TABLE LXXXV.

Condensed Summary of Forty-six Unsuccessful Cases of Secondary Amputations in the Upper Third of the Arm.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Abbott, G. J., Serg't, G, 45th Ohio, age 21.	July 21, Oct. 25, 1864.	Left; circ.; by A. A. Surg. J. B. McPherson; (excision July 21; gang.) Died Nov. 7, '64, pyæmia.
2	Ackerman, M., Pt., G, 15th Infantry, age 24.	July 3, Au. 4, '64.	Left; flap; by A. A. Surg. J. Grant. Died Aug. 10, 1864, pyæmia.
3	Austin, C., Pt., B, 1st Penn. Rifles, age 23.	May 7, July 12, 1864.	Left; circ.; by A. A. Surg. J. Morris; (exc. May 7; crysip.) Died July 28, '64, exh'n. *Spec.* 2836.
4	Barkhuff, J. H., Pt., H, 134th N. Y., age 17.	July 3, Se. 15, '63	Right; (hæmor'age.) Died Sept. 24, '63, pyæmia. *Spec.* 2776.
5	Basley, G. W., Pt., I, 1st Massachusetts Heavy Artillery, age 38.	June 22, Aug. 5, 1864.	Right; circ.; by A. A. Surg. W. C. Flowers; (gang.; hæmorrhage.) Died Aug. 5, 1864, no reaction.
6	Bell, W. A., Pt., C, 17th Ohio, age 22.	Sept. 19, Oct. 22, 1863.	Left; flap; by A. A. Surg. J. H. Greene; hæmor'age. Died Nov. 7, 1863, pneumonia.
7	*Bradford, A.*, Pt., B, 28th Alabama, age 22.	No. 25, '63. Feb. 25, 1864.	Right; flap; by A. A. Surg. T. G. Hickman. Died March 2, 1864, pneumonia. *Spec.* 2190.
8	Brint, J., Corp'l, F, 14th Ohio, age 27.	Aug. 5, Sept. 23, 1864.	Right; circ.; by A. A. Surg. J. H. McIntyre; (hæm.; liga. brachial; gangrene;) necrosis. Died Oct. 12, '64, pyæmia. *Spec.* 3756.
9	Christy, T., Pt., G, 25th Illinois, age 25.	June 21, Aug. 11, 1864.	Right; flap; by A. A. Surg. F. B. Mossinger. Died Sept. 26, '64, irritative fever.
10	Cole, J., Private, H, 7th Michigan.	July 3, Se. 12, '63.	Left; circ.; by A. A. Surg. J. W. Cushing. Died Oct. 10, '63, pyæm.
11	Crooker, J. L., Pt., L, 1st Maine Heavy Artillery, age 17.	May 19, June 22, 1864.	Right; lat. flaps; by A. A. Surg. H. M. Dean; (necrosis.) Died June 21, '64, pyæmia. *Specs.* 2638, 2667.
12	Cusick, M. J., Pt., F, 29th Pennsylvania, age 24.	May 25, Aug. 2, 1864.	Left; by A. A. Surg. J. M. Brown; (excis. May 25.) Died August 8, 1864, exhaustion.
13	Davison, S., Pt., K, 40th Missouri, age 28.	Nov. 14, De. 14, '64.	Left; by Surg. J. K. Rogers, U. S. V.; (gang.) Died Jan. 3, '65, pyæmia.
14	Dabord, L., Pt., B, 12th Kentucky, age 28.	No. 30, '64, Jan. 16, 1865.	Right; flap; by A. A. Surg. C. L. Randall; (gangrene.) Died Feb. 5, 1865, tubercular phthisis.
15	Disbrow, F., Pt., B, 9th New Jersey.	Feb. 8, M'h 11, '62	Left; hæmorrhage. Died March 18, 1862, pyæmia.
16	*Easley, J. W.*, Lieut., C, 55th Alabama, age 35.	July 13, Oct. 17, 1864.	Left; circ.; by A. A. Surg. C. H. Fisher; (necrosis.) Died Nov. 7, 1864, exhaustion.
17	Ewell, H., Pt., I, 10th Mass. H. A., age 20.	Aug. 24, No. 10, '64	Left; circ.; by A. A. Surg. I. P. Arthur. Died Nov. 21, '64, pyæm.
18	Fleckinger, T. F., Pt., I, 81st Pennsylvania, age 23.	July 2, Aug. 2, 1863.	Right; by A. A. Surg. J. McClellan. Died August 13, 1863, typhoid fever. *Spec.* 2767.
19	*Hampton, J. K. P.*, Pt., 36th Tennessee.	Feb. 16, M'h 25, '62	Left; circ.; by Dr. Briggs; (excis. Feb. 18, '62.) Died March 29, '62.
20	Haviland, W., Pt., C, 92d Illinois.	Sept. 19, Oct. 27, 1863.	Circ.; by A. Surg. C. F. Haynes, U. S. V. Died Nov. 6, '63, traumatic pneumonia.
21	Herpst, H., Serg't, H, 119th Penn., age 25.	May 5, June 7, 1864.	Right; flap; by A. A. Surg. D. P. Wolhaupter; hæm.; lig. axil'ry. Died June 15, 1864, exhaustion.
22	Ingoldsby, J., Pt., G, 23d Illinois.	Se. 20, '61, Nov. 1, 1862.	Left; by Surg. W. D. Winer, 23d Ill.; (Sept. 20, excis. exostosis; erysipelas.) Died Aug. 7, 1863.
23	Kleckner, J., Pt., H, 2d Penn. Art., age 18.	July 5, Aug. 9, 1864.	Right; flap; by A. A. Surg. C. M. Bellows; (exc. July 5; hæm. Aug. 9.) Died Aug. 11, '64. *Spec.* 3667.
24	Knox, B. E., Pt., A, 1st Delaware Cavalry, age 27.	Feb. 15, April 10, 1865.	Right; flap; by Surg. D. W. Bliss, U. S. V.; (also w'd of thigh.) Died Apr. 28, '65, pyæmia. *Specs.* 4038, 4056, 4095.
25	Kramer, J., Pt., D, 72d New York, age 22.	May 5, '62, Feb. 16, 1863.	Left; by A. A. Surg. J. A. Draper. Died Feb. 23, '63, pyæmia. *Spec.* 2069.
26	Logan, J. M., Corp'l, A, 8th Md., age 29.	May 8, Au. 6, '64.	Left; circ.; by A. A. Surg. J. Morris. Died Aug. 6, '64. *Spec.* 2930.
27	Molloy, J., Pt., A, 58th Penn., age 28.	May 23, July 6, '63	Right; by Surg. I. F. Galloupe. 17th Mass. Died Jul. 14, '63, pyæ.
28	Monahan, J., Corp'l, E, 22d Mass., age 38.	May 5, Sept. 17, 1864.	Right; flap; by Surg. R. B. Bontecou, U. S. V.; (exc. May 6; hæm.) hæm. Sept. 19; amp. sh. jt.; gang. Died Sept. 26, 1864. *Spec.* 3331.
29	Perry, J. N., Pt., I, 7th Mass., age 22.	May 5, July 12, 1864.	Right; oval flap; by A. A. Surg. J. H. Jamar; pyæmia. Died July 24, '64, exhaustion. *Spec.* 3610.
30	Piser, T., Pt., D, 125th New York, age 21.	May 12, J'e 22, '64.	Right; flap; by Surg. Chas. Page, U. S. A. Died July 2, 1864, dysentery.
31	Price, W. T., Corp'l, D, 10th Kentucky.	Se. 19, '63, Second'y.	Right. Died Dec. 3, '63, diarrhœa, erysipelas, and pleuritis.
32	Pyne, E. L., Lieut., K, 50th Ohio, age 35.	De. 15, '64 Feb. 6, 1865.	Right; circ.; by A. Surg. W. B. Trull, U. S. V.; (necrosis.) Died Feb. 6, 1865, tetanus.
33	Riggle, M. A., Pt., F, 2d Pennsylvania Reserves, age 21.	July 2, Aug. 5, 1863.	Right; circ.; by A. A. Surg. J. A. Buchanan. Died Aug. 19, 1863, pyæmia. *Spec.* 2784.
34	Rowland, J., Serg't, H, 124th N. Y., age 26.	May 3, J'e 21, '63.	Left; flap; (exc. May 13; pyæmia; hæm.) Died June 22, 1863.
35	*Ruth, J.*, Pt., H, 6th Arkansas, age 33.	No. 30, '64 Jan. 2, 1865.	Left; ant.-posterior flap; by Surg. Cooper, C. S. A.; (amp. of right arm Dec. 1;) gangrene. Died March 26, 1865, exhaustion.
36	Satterfield, E., Pt., F, 12th W. Va., age 40.	April 2, July 31, 1865.	Left; circ.; by Surg. H. L. W. Burritt, U. S. V.; (erysipelas;) hæm.; Died Aug. 7, 1865, pyæmia.
37	*Shaw, T. M.*, Pt., H, 10th Alabama, age 24.	July 3, Aug. 4, '63	Left; by A. A. Surg. H. H. Sutton, Died March 1, 1865. *Spec.* 1215.
38	Smith, D. S., Pt., 14th Ind. Bat., age 21.	Mar. 27, June 13, 1865.	Right; circular; by Asst. Surg. A. Hartsuff, U. S. A.; (phleg. erysipelas.) Died June 15, 1865, exhaustion.
39	Steele, J. M., Lieut., F, 44th Missouri, age 37.	Nov. 30, De. 31, '64	Left; flap; by A. A. Surg. J. A. Hall. Died Feb. 7, '65, pyæm.
40	Sullivan, J., Pt., I, 8th Maine, age 33.	June 3, Au. 15, '64	Left; by A. A. Surg. G. E. Brickett; (necrosis.) Died Sept. 3, 1864.
41	Tucker, H. S., Corp'l, D, 23d Kentucky, age 20.	Sept. 19, Nov. 17, 1863.	Left; circ.; by A. A. Surg. W. H. Matlock; (gang'e.) Died Nov. 28, 1863, pyæmia. *Spec.* 1928.
42	Washburn, M. S., Pt., A, 48th Indiana.	Sept. 19, Oct. 20, '62	Left. Died November 2, 1862, pneumonia.
43	Williams, W., Corp'l, K, 6th Col'd T., age 25.	Sept. 29, De. 22, '64	Left; flap; by A. A. Surg. A. M. Paine. Died January 19, 1865, typhoid fever.
44	Wilson, H., Pt., G, 27th Ohio.	Oct. 4, '62, Feb. 6, '63	Right; (erysipelas.) Died Feb. 17, '63, colliquative diarr. *Spec.* 969.
45	*Wooden, W.*, Pt., D, 11th Louisiana.	April 6, M'y 12, '62	Died May 19, 1862.
46	Worden, H., Pt., I, 6th N. Y. H. A., age 35.	May 20, July 5, 1864.	Right; circ.; by A. A. Surg. E. De Witt; (gangrene.) Died August 23, 1864, pyæmia.

2. Secondary Amputation at the Middle Third of the Arm.—The one hundred and sixty-two secondary amputations at the middle third of the arm furnished one hundred and twenty-seven recoveries, or as many as the somewhat larger series of secondary amputations in the upper third, but only thirty-five deaths, a mortality rate of 21.6, or 5 per cent. less than in the upper third amputations. Eleven of the one hundred and sixty-two operations were practised on Confederate soldiers. The modes of operation are returned as—circular, sixty-five; flap, sixty-four; oval, three; not stated, thirty.

§ *Successful Cases.*—Of one hundred and twenty-seven successful secondary amputations of the arm at the middle third, seventy-eight were practised on the left and forty-nine on the right extremity. The injuries in six cases had been inflicted by large projectiles. Seven patients were returned to modified duty, seven were exchanged or paroled, and one hundred and thirteen discharged, and, with rare exceptions, pensioned. Seven of the pensioners have died from causes but remotely connected with their injuries. Five of the patients had received wounds elsewhere than in the arm. Forty-four had undergone antecedent operations, viz: Ablation at the elbow, one; amputation of the forearm, twelve; amputation of portions of the hand, two; primary excision in shaft of humerus, three; excision of elbow joint, nine; excision in ulna, seven; in radius, three; in radius and ulna, one; partial excision of carpus, three; removal of portion of radial nerve, one; ligation of brachial artery, one; ligation of radial artery, one. Twelve of the patients survived ulterior operations—one a re-amputation of the shoulder joint, one a re-amputation of the upper third and subsequent enucleation of the head of the humerus, two others re-amputation in the upper third, seven resections of the protruding humerus or extraction of the sequestra, and one ligation of the brachial artery. Many patients eventually recovered after being placed in jeopardy by the gravest complications: In one case there were symptoms of tetanus; in eighteen, consecutive bleeding; in twenty, serious sloughing; in fourteen, erysipelas,—several of these complications sometimes appearing in the same patient.

CASE 1696.—Sergeant N. Strain, Co. C, 9th Regiment Veteran Reserve Corps, aged 28 years, was wounded at Fort Stevens, July 11, 1864, and sent to Mount Pleasant Hospital. Assistant Surgeon C. A. McCall, U. S. A., reported: "Gunshot wound of left forearm, middle third; ball entered outer side, making its exit near inner condyle of humerus. Hæmorrhage occurred on July 23d, and August 3d and 12th, from the posterior interosseous artery. Thirty-four ounces was the probable amount of blood lost. The first hæmorrhage was arrested by compression, the second and third by the introduction of a finger into the wound." Acting Assistant Surgeon C. E. C. Darby, who performed the amputation, reported, February 20, 1865: "The patient was admitted from Fort Stevens, having been wounded through the left upper extremity. Erysipelas supervened shortly after admission, and was controlled by the usual means. On the fifth or sixth day after admission, profuse hæmorrhage took place from the posterior wound, which was checked by compressing the brachial artery. The patient himself states that he had hospital gangrene in the limb, but as the surgeons in attendance in his ward have been frequently changed since his admission it is impossible to obtain a continuous record of the case. On February 10th the limb presented the following appearance: The skin was tense, shiny, and of a dark red color, the arm much swollen and its surface irregular, with profuse suppuration from three large sloughing surfaces at different points. On examination with the probe sinuses were found running in various directions, but no dead bone could be detected. The pulsations of the radial artery were observable at the wrist. The general health of the patient was good. He was of a cheerful, contented disposition, with good appetite, and regular in every respect, though somewhat debilitated from suppuration and confinement. On February 15th, as the arm still continued to suppurate, it was decided to amputate the limb, which was done at eleven o'clock A. M. on that day. A circular amputation was performed at the junction of the middle and lower thirds of the arm. The anæsthetic used was a mixture of chloroform one-third, to ether two-thirds. Some little difficulty was experienced in ligating the bleeding vessels, these being much enlarged from previous inflammation. Thirteen ligatures were applied. The patient reacted finely, and has progressed favorably to date. Suppuration was freely established four days after the amputation, and it was found necessary to remove one suture to give exit to pus. The diet of the patient is nourishing, consisting of mutton chops, ham, potatoes, milk, bread, butter, corn-starch, etc. He also takes a moderate amount of whiskey, from six to eight ounces each day." Pathological preparations, represented in PLATE XLVIII, opposite, were contributed to the Museum by Assistant Surgeon H. Allen, U. S. A. One of them consists of "the bones of the left forearm after amputation at the junction of the lower thirds of the humerus, showing apparent contusion of both bones in their upper thirds, and necrosis of the entire shaft of the radius and of nearly the whole of the ulna, surrounded by extensive

PLATE XLVIII. INVOLUCRA OF BONES OF THE FOREARM AND SEQUESTRUM FROM HUMERUS.

Nos. 3686 and 3727. SURGICAL SECTION.

involucra." In addition to the history by the operator, Dr. Allen furnished the following note: "This case was reported to have been a flesh wound. There is no evidence to the contrary, though the amount of osseous change which has taken place in the radius and ulna would lead to the inference that the ball, if not absolutely fracturing either bone, had at least grazed one or both. In addition to the facts given by Dr. Darby, it may be said the phalangeal, wrists, and elbow joints were anchylosed, pronation and supination destroyed, the member painful, burdensome, and useless. Upon examining the fleshy parts of the forearm after amputation, it was found that the sub-integumental layer was of a yellowish-white color and of dense consistence. The muscles were almost colorless and unelastic, the section of their fibres resembling the transverse section of an onion. Upon opening the elbow joint partial true anchylosis was demonstrated. The greater sigmoid cavity of the ulna and the outer two-thirds of the articular face of the head of the radius were covered with firm plastic growth adherent to the contiguous surface of the humerus. This new tissue was of a pearly lustre on the outer layer, subdued by the presence of streaks of blood, while the deeper seated portions were of a dark purplish red color. It was very vascular, and presented numerous tortuous vessels of small calibre through its substance. The cartilage of the joint presented no abnormal appearance to the naked eye, but a section of that portion covering the radius presented unequivocal evidence of degenerative change in the cartilage cells when examined with the one-fifth objective." Another operation was performed at a subsequent date, when a heavy tubular sequestrum, four and a half inches in length, was removed from the stump. This specimen was also contributed by Dr. Allen, and is represented in PLATE XLVIII, between the two preparations of the bones of the forearm. On May 22d, the patient was transferred to Chester Hospital, whence he was discharged on July 27, 1865, and pensioned. In his application for commutation, dated 1870, he described the stump as being in "bad condition, as merely covered by integument, and as too tender to wear an artificial arm." Examiner D. W. Shindel, of Sunbury, Pennsylvania, on September 2, 1874, certified that "amputation was performed between the elbow and shoulder joints," and that there is a "poor stump," etc. The pensioner was paid June 4, 1875.

CASE 1697.—Private *S. B. Christienberry*, Co. C, 37th North Carolina, aged 33 years, was wounded in the right arm, at Gettysburg, July 3, 1863, and entered Chester Hospital on July 18th. Acting Assistant Surgeon G. Martin forwarded the following description of the case: "A conoidal ball caused a fracture of the olecranon process. Extensive destruction of the soft parts ensued, and the arm was amputated September 8th, with a favorable result; patient convalescing." The specimen consists of the upper halves of the bones of the right forearm, and the humerus amputated at the junction of the lower thirds. A considerable splinter of the posterior portion of the ulna is attached, by callus, out of position. The upper portion of the ulna and head of radius are necrosed, as well as the articular surface of the humerus, of which a portion has been absorbed. The shaft of each bone shows a slight coating of new osseous matter. On October 4th, the patient was transferred to the Point Lookout Hospital, whence he was sent to City Point for exchange on March 17, 1864. Acting Assistant Surgeon W. W. Bidlack reported that when the patient left the hospital "the stump, though nearly well, had not quite healed." The specimen is represented in the adjacent wood-cut (FIG. 553).

FIG. 553.—Disorganization of elbow joint, after shot fracture of the olecranon. *Spec.* 2063.

FIG. 554.—Bones of right elbow, amputated after excision for shot injury. *Spec.* 1664.

CASE 1398.—Private W. Leiblein, Co. C, 20th Massachusetts, aged 32 years, was wounded at Fredericksburg, December 11, 1862. He was admitted to the field hospital of the 2d division, Second Corps, where Surgeon G. S. Palmer, U. S. V., recorded: "Fracture of arm; resection of upper third of ulna and radius." On December 25th, the wounded man reached Washington, where he was admitted to Armory Square Hospital. In the following April he was transferred to McDougall Hospital, New York, where the arm was amputated. Assistant Surgeon R. Bartholow, U. S. A., in charge of the latter hospital, forwarded the specimen (FIG. 554) consisting of the bones of the right elbow, from which the olecranon and the lowest two inches of the humerus have been excised; subsequently amputated in the middle third of the arm. The bones of the forearm are anchylosed, and the extremity of the humerus presents an irregular deposit of callus. Acting Assistant Surgeon W. F. Cornick reported the patient's admission to Lovell Hospital, Portsmouth Grove, R. I., on November 4th, by reason of "amputation of right arm, performed before admission, May 16, 1863;" also that "Surgeon N. Hayward, 20th Massachusetts, performed the operation of excision." The patient was finally discharged from Central Park Hospital, New York City, on August 1, 1864, and pensioned. In the previous month he was furnished with an artificial arm by Mr. Lincoln, of Boston, who, in his statement, reported that the amputation was performed by flap method. In the man's application for pension it is mentioned that "Assistant Surgeon R. Bartholow, U. S. A., performed the amputation." This pensioner died on May 23, 1872.

CASE 1699.—Private S. C. Stewart, Co. F, 2d Maine, aged 44 years, was wounded at Bull Run, July 21, 1861, and admitted to the E street Infirmary, at Washington, on the following day. Assistant Surgeon J. W. S. Gourley, U. S. A., contributed the specimen with the following minutes of the case: "The patient was shot in the left elbow, the ball having been extracted previous to his admission. The missile entered at the external and posterior part of the elbow. On the day subsequent to his admission erysipelas set in, and was followed by very profuse suppuration and burrowing of pus nearly midway up the arm. Free incisions were made for the escape of pus, and the arm kept still, with a hope of performing a secondary resection of the elbow, which had been objected to when the patient was first seen. But about one month after the injury he had become so feeble, and his condition was such, that longer delay would have been fatal, and amputation at the middle third was resorted to as the only means of preserving his life. From that moment his condition improved, and the bed-sores which he had healed, he having meanwhile been placed on a water-bed kindly furnished by Dr. T. Foster Jenkins, of the Sanitary Commis-

sion. The patient was discharged from hospital, cured, on September 21st." On October 2, 1861, the patient was discharged from service and pensioned. On December 21, 1864, an artificial arm was furnished by Mr. Lincoln, of Boston, who described the case as a "circular amputation at the middle of the arm," and the stump as "healed." This pensioner died on January 23, 1869. The specimen (FIG. 555) consists of the lower half of the left humerus, from which the outer condyle has been carried away, and a large fragment of the shaft split off and afterward partially reunited.

FIG. 555. — Results of shot fracture of outer condyle of left humerus. *Spec.* 350.

CASE 1700.—Private J. T. Crawford, Co. K, 51st New York, aged 17 years, was wounded in the left arm, at Manassas, August 30, 1862, and entered Judiciary Square Hospital at Washington. Surgeon C. Page, U. S. A., reported: "Gunshot wound through left elbow joint, ball entering nearly over and somewhat toward the outer edge of the coronoid process of the ulna and emerging behind the olecranon. The wound was explored on September 10th, when entire comminution of the joint was discovered. The arm was amputated at the middle third of the humerus, on October 7th, by Acting Assistant Surgeon F. H. Brown. Ether was used." The specimen (FIG. 556) was contributed by the operator, and consists of "the lowest third of the left humerus and upper halves of the bones of the forearm. * * A nearly longitudinal fracture has split off the lower and outer four inches of the humerus; the tip of the olecranon is fractured, and the articular surfaces of the three bones are carious. A large fragment of the shaft has reunited with displacement. The epiphyseal lines are well shown."—(*Cat. Surg. Sect.*, 1866, p. 166.) On March 28th, the patient was transferred to Ladies' Home, New York City, whence he was transferred to the Veteran Reserve Corps on September 14, 1863. He was ultimately discharged on November 28, 1865, and pensioned. An artificial arm was furnished in May, 1864, by Mr. Lincoln, of Boston, who reported that the amputation was performed by flap method. In his application for commutation, in 1870, the pensioner reported that two operations were performed, subsequent to the amputation, by Surgeon A. B. Mott, U. S. V., and Acting Assistant Surgeon G. M. Smith, at the Ladies' Home Hospital, and described "the remaining stump of the arm as being four inches long from the shoulder, and in good condition." This pensioner was paid June 4, 1875.

FIG. 556.—Shot comminuti'n of the left elbow. *Spec.* 132.

TABLE LXXXVI.

Condensed Summary of One Hundred and Twenty-Seven Cases of Recovery after Secondary Amputation in the Middle Third of the Shaft of the Humerus.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Allen. J. B., Serg't, B, 30th Ohio.	May 22, J'e 22,'63	Left. Discharged Aug. 7, 1863; pensioned.
2	Averill, J., Corp'l, K, 154th New York.	Oct. 27, De. 23,'62	Right. Discharged February 25, 1863; pensioned. *Spec.* 667.
3	Babcock, D. A., Serg't, C, 6th N. Y. C., age 24.	Aug. 16, Oct. 9, 1864.	Left; circ.; by A. A. Surg. J. Neff; (exc. el. joint Aug. 17.) Disch'd Dec. 7, '64; pens'd. *Spec.* 3418.
4	Baker, A. D., Pt., A, 1st Pa. Rifles, age 20.	Sept. 14, Oct. 18, 1862.	Left; lateral flap; by A. A. Surg. W. W. Keen. Disch'd Nov. 27, '62; pens'd. Re-amp. 1869. *Spec.* 780.
5	Bartlett, R. F., Serg't, D, 96th Ohio, age 23.	Nov. 3, De. 13,'63	Left; circ.; by A. Surg. S. H. Orton, U. S. A. Dis'd Jan. 25,'64; pens'd
6	Beck, G., Pt., B, 35th Ill., age 20.	May 27, Aug. 17, 1864.	Right; circ.; by A. A. Surg. L. B. McNabb; (amp. forearm May 28; gangrene.) Mustered out Sept. 27, 1864; pensioned.
7	Bennett, J., Pt., G, 118th N. Y., age 24.	May 16, J'e 19,'64.	Left; circular. Discharged Dec. 26, 1864; pensioned.
8	Berry, P., Pt., A, 31st Maine, age 21.	May 12, July 12, 1864.	Left; flap; by Surg. N. R. Moseley, U. S. V.; (amp. forearm May 14; erysip.; necrosis.) Disch'd Sept. 28, '64; pensioned. *Spec.* 2873.
9	Bierce, P., Pt., A, 1st Ohio Art., age 20.	Nov. 13, Dec. 25, 1863.	Left; flap; by Surg. G. H. Bane, 115th Ill.; (Nov. 13, leg amp.) Disch'd Aug. 29, '64; pensioned.
10	Bix, D., Pt., I, 78th New York, age 35.	May 3, Sept. 23, 1863.	Left; double flap; by A. A. Surg. R. A. Cleeman; (May 11, amp. finger; gangrene.) Disch'd Dec. 19, 1863; pensioned. *Spec.* 2741.
11	Boughan. J. M., Pt., C, 54th Ohio.	May 18, J'e 18,'63.	Left; flap; by Surg. E. McDonnell, U. S. V. Dis'd Nov. 1,'63; pens'd.
12	Bowers, J. W., Pt., D, 1st Maryland, age 36.	June 1, July 8, 1864.	Left; flap; by A. A. Surg. A. McLetchie; (gang.; hæm'e;) amp. sh. j't Mar. 22. Disch'd July 3,'65; pensioned. Died July 21, 1868.
13	Brady, H., Pt., G, 6th Wisconsin.	Sept. 17, Dec. 18, 1862.	Left by A. A. Surg. L. Heard. Discharged January 15, 1863; pensioned. Re-amp. Sept., 1864.
14	*Brandon, J. J.*, Pt., H, 41st Miss., age 26.	No. 20,'64 Feb. 7,'65	Right; circ.; by Surg. B. B. Breed, U. S. V. To Pro. Mar. May 6,'65.
15	Brown, R. N., Pt., G, 22d Massachusetts.	May 16, Sept. 19, 1864.	Right; circ.; by A. A. Surg. T. B. Townsend; (June 9, amp. forearm.) Disch'd Feb. 7,'65; pens'd.
16	Brundage. E. A., Pt., F, 11th Michigan Cav.	Oct. 2, Nov. 27, 1864.	Right; circular; by A. A. Surg. G. W. McMillan. Discharged March 20, 1865; pensioned.
17	Butt, E., Pt., G, 30th Indiana.	De. 31,'62 Mar. 14, 1863.	Left; flap; by A. A. Surgs. J. W. Knight and J. M. Pillsbury. Disch'd Aug. 17, '63; pensioned.
18	*Calloway, J.*, Pt., D, 50th Virginia, age 41.	July 9, Aug. 10, 1864.	Left; circ.; by A. A. Surg. A. Kessler; (July 9, excision of ulna.) For exchange Sept. 19, 1864.
19	Carter, R. E., Pt., E, 7th Mo. S. M., age 23.	Oct. 23, Dec. 3,'64	Left; circ.; by A. A. Surg. G. H. Hood. Duly March 23, 1865.
20	Carmack, A., Pt., 63d Indiana, age 35.	May 14, Jul. 13,'64	Right; flap. Discharged August 30, 1865.
21	Cary, G. W., Pt., A, 87th Illinois.	April 8, May 15, 1864.	Right; flap; by Surg. W. S. Webster, 95th C. T.; (exc. wrist April 8,'64.) Dis'd June 16,'64; pens'd.
22	Chambers, B., Pt., I, 5th Tenn., age 17.	May 14, Aug. 10, 1864.	Right; flap; by A. Surg. W. B. Trull, U. S. V.; (gangrenous.) Discharged June 14, 1865.
23	Childs, H. F., Pt., G, 95th Illinois.	June 17, July 22, 1864.	Left; lat. flap; by A. A. Surg. R. W. Carle; (exc. humerus June 18.) Disch'd Jan. 26,'65; pens'd.
24	*Christenberry, S. B.*, Pt., C, 37th N. C.	July 3, Sep. 8,'63.	Right. Exchanged Mar. 17, 1864. *Spec.* 2063.
25	Clancy, M., Pt., D, 9th Mass., age 26.	July 1, Aug. 14, 1862.	Left; flap; by A. A. Surg. E. M. Robertson. Disch'd Nov. 27,'62. Died Dec. 13, 1864, ch. diarrhœa.
26	Cole, T. W., Serg't, D, 74th Illinois, age 26.	May 14, Oct. 23, 1864.	Right; circ.; by Dr. C. H. Richings; (May 14, exc. elb. joint.) Dis'd June 20, 1865; pensioned.
27	Connelly, M., Pt., D, 63d N. Y., age 23.	June 3, 12, '64.	Left; circ.; by A. A. Surg. J. P. Arthur; (exc. ulna June 3.) June, 1865, removal of bone. Disch'd October 5, 1865; pensioned.
28	*Cookley, J. W.*, Pt., G, 44th Georgia, age 22.	July 1, Sep. 2,'62.	Left; circ.; by Surg. W. A. Thom, P. A. C. S. Disch'd Oct. 11,'62.
29	Coons, O. C., Pt., H, 65th New York, age 24.	May 5, Sept. 16, 1864.	Right; circular; by A. A. Surg. H. Craft; (gangrene;) Mar. 27, '65, sequestrum removed. Disch'd May 27, 1865. *Spec.* 1990.
30	Cost, G. T., Corp'l, C, 49th Ohio.	De. 31,'62 Fe. 16,'63.	Right; circ.; by Surg. J. F. Weeks, 51st Ill. Disch'd April 4, 1863; pensioned.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
31	Craft, E., Pt., F, 126th New York, age 24.	July 2, Aug. 12, 1863.	Left; circular; by A. A. Surg. E. Seyffarth; hæm., necrosis; Dec. 18, re-amp., caries; Dec. 22, exc. head humerus. Disch'd May 19, 1865; pensioned.
32	Crawford, J. T., Pt., K, 51st New York.	Aug. 30, Oct. 7, 1862.	Left; flap; by A.A.Surg.F.Brown; two subseq. opera's. To V. R. C. Sept.24,'63; pensioner. *Spec.*132.
33	Crone, L. E., Corp'l, E, 22d Massachusetts.	June 27, Au. 4, '62.	Left; flap; by A.A.Surg.J.H.Lyman. Disch'd Sept.3,'62; pens'd.
34	Crymble, S., Pt., E, 79th New York.	June 16, Jul.28,'62	Left; flap; by A. A. Surg. Sands. Disch'd Oct. 4, 1862; pensioned.
35	Cutting, H., Corp'l, C, 6th Iowa, age 23.	July 16, Oc.24,'63.	Left; by A. A. Surg. A. Sterling; (exc. elb. joint July 16.) Disch'd July 18, 1864; pensioned.
36	Davis, S., Pt., B, 6th Conn., age 26.	June 17. Jul.26,'64	Left; flap; by A. A. Surg. T. H. Bishop. Dis'd April 13,'65; pen'd.
37	Davis, D., Pt., G, 1st Maine H. A., age 19.	June 16. July 24, 1864.	Left; flap; by A. A. Surg. G. E. Brickett; (gangrene.) Disch'd Sept. 13, 1865; pensioned.
38	Davis, D. C., Pt., I, 11th N. H., age 30.	May 18. Jul.28,'64	Left; flap; (exc. radius May 18.) Disch'd Jan. 31, 1865; pens'd.
39	Delong, J., Pt., A, 7th Missouri, age 41.	De. 5,'64, Jan. 26. 1865.	Right; circ.; by A. Surg. C. B. Merrill, U.S.A.; (gangrene; erysipelas before and after amp'n.) Disch'd Oct. 9, 1865; pensioned.
40	Dixon, J., Corp'l, F, 8th N. Y. H. A., age 22.	J'e 22,'64, Ja.20,'65.	Flap; by A. A. Surg. M. A. M. Smith. Disch'd June 24, 1865.
41	Downey, D., Pt., H., 28th Mass., age 44.	May 5, June 14, 1864.	Right; flap; by A. A. Surg. W. P. Moon; (erysipelas; necrosis.) Disch'd Jan. 11, 1865; pens'd.
42	Dukes, G., Pt., B, 97th Pennsylvania.	Aug. 4, Sept. 20, 1864.	Left; flap; by A. Surg. C. Wagner, U.S.A.; (amp. forearm Aug. 28, '64.) Disch'd Jan. 20,'65; pen'd. Died Mar.14,'67, hæm.from lung.
43	Dunbar, G. H., Serg't, C, 19th Maine, age 26.	July 3. Aug. 15, 1863.	Right; flap; Mar. 24, 1864, bone removed; erysipelas. Disch'd February 6, 1865.
44	Ellis, D., Pt., A, 12th N. H., age 34.	May 3, June 16, 1863.	Right; by A. A. Surg. E. Coues; hæm.; lig. of brachial. Disch'd August 29, 1863; pensioned.
45	Ellis, I. N., Pt., C, 103d Ill., age 25.	Mar. 21, May 16, 1865.	Left; circ; by A. Surg. W. Webster, U. S. A.; (Mar. 21, exc. el. jt.) Disch'd.June 29,'65; pens'd.
46	Eva, J. H., Pt., K, 106th Pa., age 42.	July 3, Oct. 28, 1863.	Left; flap; by A. A. Surg. T. G. Morton; (July 5, amp. forearm; necrosis;) crysip. Disch'd Sept. 26, 1864; pens'd. *Spec.* 2752.
47	Everett, C. W., Serg't, H, 49th Ohio.	De. 31,'62 Feb. 6, 1863.	Left; flap; by A. Surg. L. Russell, 8th Ky.; (Jan. 6, exc. at elbow.) Disc'd Apr. 16,'63; pens'd.
48	Frederick, J. G., Pt., E, 103d Ill., age 27.	Nov. 25, 1863, Mar. 23, 1864.	Left; circ.; by Med. Cadet C. H. Fisher; (Nov. 25, exc. radius and ulna; necrosis.) Disch'd Feb. 18, 1865; pensioned. *Spec.* 2206.
49	Frederick, J. S., Serg't, D, 1st Wisconsin Cavalry, age 24.	April 16, May 18, 1865.	Left; flap; by Surg. G. E. Ranney, 2d Mich. Cav. Disch'd Nov. 15, 1865; pensioned.
50	Garland, N., Pt., C, 1st Maine Heavy Art.	May 19, July 29, 1864.	Right; circ.; by Drs. Parker and Harding. Discharged Dec. 3, 1864; pensioned.
51	Gaston, S. S., Pt., K, 100th Penn.	Aug. 29, Nov. 11, 1862.	Left; circ.; (Sept. 26, exc. radius; erysipelas.) Disch'd Jan. 27,'63; pensioned. *Spec.* 1868.
52	Giles, R. S., Serg't, K, 146th N. Y., age 23.	June 1, 1864, 1868.	Right; by Drs. James and Walcott; (June 1,'64, exc. humerus; anchylosis.) Disch'd Jan. 9,'65; pensioned.
53	Green, N. H., Pt., D, 6th Michigan Cavalry.	Sept. 14, Nov. 17, 1863.	Left; circ.; by A. A. Surg. W. F. Peck; (Sept. 15, exc. ulna: gang.; Nov. 3, amp. forearm; hæm'rge.) Disch'd Mar. 25, '64; pens'd.
54	Green, J. J., Pt., B, 18th Massachusetts.	Aug. 30, Oct. 2,'62	Left; by A. Surg. G. M. McGill, U. S. A. Disc'd Nov. 26,'62; pens'd.
55	Griest, O. E., Pt., B, 104th Ill., age 21.	May 14, J'e 26,'64.	Left; antero-posterior flap. Discharged March 8, '65; pens'd.
56	Hagey, W., Pt., E, 57th Penn., age 16.	May 10, July 7, 1864.	Right; flap; by A. Surg. H. M. Sprague, U. S. A.; (hæm.; also w'd of abdomen.) Disch'd April 19, 1865; pensioned.
57	Hancock, S., Pt., I, 1st Maine Heavy Art., age 38.	May 19, Aug. 10, 1864.	Right; circ.; by A. A. Surg. G. E. Brickett; (erysip.) Disch'd Jan. 1, 1865.
58	Hastings, C. W., Pt., E, 2d U. S. S. S., age 21.	May 2, July 4, 1863.	Right; flap; by Surg. D. P. Smith, U.S.V.; (also w'd hip; June 23, exc. bones hand; hæm.; brachial lig'd.) Disc'd Oct. 9,'63; pens'd.
59	Hatch, S., Pt., F, 20th Maine, age 24.	May 5, Aug.8,'64	Right; flap; by Dr. Benson. Discharged Feb. 8, 1865; pens'd.
60	Hawkins, L. B., Pt., C, 77th N. Y., age 26.	May 6, Aug. 6, 1864.	Left; circ.; by A. A. Surg. J. Neff; (gangrenous.) Disch'd Feb. 14, 1865; pens'd. *Spec.* 3187.
61	Herman, C., Pt., E, 1st Massachusetts.	J'e 30,'62, after discharge.	Right; circ.; (June 30, amp. el. jt.) Disch'd Sept. 6, 1862; pens'd.
62	Herron, J. T., Pt., D, 9th Penn. Reserves.	De. 20,'61 Ja. 27,'62.	Left; by Surg. E. Shippen, 1st Pa. L. A. Disch'd May 21,'62; pen'd.
63	Heintz, M., Pt., K, 13th Illinois.	De. 29,'62 Feb. 6,'63	Left; flap. Discharged Mar. 30, 1863; pensioned.
64	Holbrook, J. M., Capt., F, 27th Iowa.	April 9, M'y 25,'64	Left; circ.; by A. Surg S. H. Orton, U. S. A. M'd out Aug. 8,'65.
65	Hooker, W. H., Serg't, H, 142d N. Y., age 39.	June 29, Aug. 15, 1864.	Right; ant.-post. flap; by A. Surg. H. M. Sprague, U. S. A. Disc'd Oct. 5, 1864; pensioned.
66	Hosack, J., Corp'l, A, 142d Pa., age 26.	May 5, July 2, 1864.	Left; flap; by A. A. Surg. C. B. King; (gangrene; hæmor'ages.) Discharged July 27, 1865.
67	Irving, A. F., Pt., B, 159th New York.	May 28, Oct. 23, 1863.	Left; circ.; by Surg. A. B. Mott, U. S. V.; (June 18, amp. forearm; gang.) Disc'd Jan. 17,'64; pen'd.
68	Jenkins, J., Pt., I, 4th N. Y. Prov. Cav.	Mar. 14, October, 1865	Left; by Surg. C. M. Clark, 39th Ill.; (Mar., 1865, portion of ulna removed.) Disch'd Dec. 5, '65.
69	Jessop, M., Pt., D, 14th Iowa.	Apr. 6,'62 M'h,1863.	Left; by Drs. Swates and Schreiner. Disc'd Sept. 13,'63; pens'd.
70	Kelly, C., Pt., E, 35th Iowa.	April 9, May 17, 1864.	Left; ant.-post. flap; by Surg. J. G. Keenon, U. S. V. Disch'd June 1, 1865; pensioned.
71	Kent, J., Pt., D, 30th Illinois, age 23.	July 22, Aug. 24, 1864.	Left; flap; by A. Surg. N. S. Hill, 121st Ohio; (July 22, excision.) Disch'd May 15, '65; pensioned.
72	Larke, H., Pt., G, 8th Pa. Reserves, age 18.	De. 13,'62 Jan. 30, 1863.	Left; flap; by A. Surg. J. W. Pettinas, 67th Pa.; (gang.) Disch'd June 1, '63; pens'd. *Spec.* 945.
73	Leinbach, T., Pt., E, 9th Mich. Cav.	Se. 24,'63, Dec., '63.	Right; flap; by A. A. Surg. F. M. Lincoln. Dis'd Jul. 27,'64; pen'd.
74	Leiblein, W., Pt., C, 20th Mass., age 33.	Dec. 11, 1862, May 16, 1863	Right; flap; by A. Surg. R. Bartholow, U. S. A.; (Dec. 11, excis. el. jt.) Disc'd Aug. 1,'64; pen'd. Died May 23, 1872. *Spec.* 1664.
75	Lewis, H., Serg't, A, 2d Wisconsin.	Aug. 28, Nov. 10, 1862.	Left; circ.; (Aug. 30, amp. forearm; caries of elbow.) Pens'd Nov. 21, '64. *Spec.* 368.
76	Long, D., Pt., L, 72d Indiana.	June 24, Oct. 25, 1863.	Right; circ.; (June 28, exc. elbow joint; hæm.; gang.) Pens'd Feb. 24, 1864. *Specs.* 2129, 1750.
77	Lynch, J., Pt., H, 55th Illinois.	May 22, Jul 21,'63	Right; by A. A. Surg. R. McGowan. Disch'd Oct. 6,'63; pens'd.
78	McAdams, W., Pt., G, 28th C. T., age 15.	May 16, July 4,'64	Left; circular. Duty November 21, 1864.
79	McCarty, F., Pt., 10th Wisconsin Battery, age 27.	Aug. 30, Nov. 9, 1864.	Right; ant.-post. flap; by A. Surg. B. E. Fryer, U. S. A.; (hæm.) Mustered out in 1865; pensioned.
80	*McClintock, J. H.*, Corp., H, 24th South Carolina, age 21.	No. 30,'64 Jan. 20, 1865.	Left; ant.-post. flap; by Surg. G. E. Cooper, U. S. A. To Provost Marshal March 1, 1865.
81	*McCarny, J.*, Pt., E, 69th Georgia.	Aug. 27, Se. 30,'62.	Right; flap; Disch'd Nov. 14, 1862.
82	McFadden, L. L., Pt., E, 79th Indiana.	May 10, Jul. 13,'64	Left; by A. A. Surg. C. K. Hendee. Disch'd March 7, 1865; pens'd.
83	McFalls, A., Private, C, 157th Penn., age 21.	Jun. 3,'64, Feb. 27, 1865.	Left; flap; by A. A. Surg. M. Rizer; (June 15, amp. forearm.) Disch'd Aug. 2, 1865; pens'd.
84	McGinness, J., Pt., H, 9th New York.	Sept. 17, Nov. 25, 1862.	Right; flap; by A. A. Surg. L. Fisher; (necrosis.) Disc'd June 17,'63; pens'd. *Spec.* 862.
85	McKenny, W. W., Corp., F, 134th N. Y., age 21.	May 8, June 9, 1864.	Right; ant.-post. flaps; by Dr. A. D. White; (May 8th, excision of radius.) Pens'd Feb. 9, 1865.
86	Miller, H., Pt., I, 2d Md., age 26.	June 20, July 30, 1864.	Left; circ.; by A. A. Surg. B. B. Miles; (necrosis.) Disch'd Dec. 14, 1864; pensioned.
87	Millett,[1] A. F., Pt., A, 17th Mich., age 27.	Mar. 31, May 5, 1865.	Left; circular; by A. A. Surg. H. Craft; (erysip.; gang.;) June 24, sequestrum removed. Disch'd July 26,'65; pens'd. *Spec.* 142.

[1] This case is identical with CASE 35, on page 470, in TABLE XLV, of *Amputation in the Upper Arm for Complications of Shot Injury unattended by Fracture.* It is again inserted here because some of the reports intimate that there was contusion of bone as well as of the soft parts. Assistant Surgeon H. ALLEN, U. S. A., reports from Mt. Pleasant Hospital, April 2d, that nearly two-thirds of the integument on the outer and anterior parts of the forearm had been destroyed by phlegmonous erysipelas, and that about May 1st hospital gangrene supervened and made rapid progress above the bend of the elbow, destroying integument and muscles, exposing the brachial, and destroying the continuity of the radial, recurrent from which copious bleeding took place. After amputation the wound took on bad action and was treated by applications of bromine and creosote. Necrosis of the humerus ensued, and on July 2d a tubular sequestrum three and a half inches in the extreme length was extracted, and contributed to the Museum by Dr. ALLEN as *Specimen* 142. It is represented by the upper left-hand figure in PLATE XLVII, opposite page 762. The patient was discharged and pensioned, July 26, 1865. Examiner C. Rynd certified, on May 7, 1873: "The cicatrix is still tender, and will necessitate another amputation, which I have advised. There is about five inches of the upper end of the humerus remaining, which is painful and comparatively useless to him. &c." The pensioner was paid on June 4, 1875.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
88	Miner, J. M., Pt., D, 6th Wisconsin.	Aug. 26, Se.30,'62.	Right; circular. Discharged Dec. 1, 1862.
89	Murphy, R., Pt., F, 81st Penn., age 35.	Dec. 13,'62 Jan. 13, 1863.	Left; flap; by A. A. Surgeon J. Stearns; necro. V. R. C. Dec. 31, '63. M'd out J'e 29,'66. *Spec.* 996.
90	Murphy, T., Pt., I, 88th New York, age 21.	Dec. 13,'62 Jan. 24, 1863.	Right; by Surg. W. Clendenin. U. S. V. To V. R. C. Aug. 29, 1863. Discharged; pensioned.
91	Naskow, C., Pt., I, 98th New York.	May 31, July 4,'62	Left; circular. Discharged; pensioned.
92	Nelson, P., Corp'l, K, 139th Pa., age 19.	May 5, June 11, 1864.	Left; circ.; by A. A. Surg. D. P. Wolhaupter. Disch'd July 27, 1865; pens'd. *Spec.* 2586.
93	Newcomb, W. J., Corp'l, K, 1st Michigan.	Aug. 30, 1862, April 3, 1863.	Left; flap; by Surg. T. R. Crosby, U. S. V., (Sept. 3,'62, amp. forearm; necrosis.) Disch'd June 9, '63; pens'd. *Specs.* 1175, 1176.
94	Noonan, J., Pt., C, 81st New York.	July 1, Oc.16,'62.	Left; flap; by Surg. B. Randall, U. S. A. Disch'd April 22,'63.
95	O'Bryan, M., Pt., 169th New York, age 24.	June 30, Aug. 2, 1864.	Left; flap; by A. A. Surg. H. B. White; (hæm.; lig. radial July 15.) Discharged Feb. 11, 1865.
96	Patterson, J. A., Pt., G, 11th Pennsylvania Reserves, age 41.	M'y 10,'64 Oct. 15, 1866.	Right; by Dr. Sinclair; (May 10, 1864, exc. ulna.) Disch'd Aug. 22, 1864; pensioned.
97	Pepper, L., Pt., 18th U. S. Infantry, age 35.	Dec. 31, 1862, Feb. 12, 1863.	Right; ant.-post. flap; by Surg. J. Shrady, 2d Tenn.; (hæm's; brachial lig. Jan. 10; necrosis.) Discharged April 21, 1863; pens'd.
98	Peterson, J., Serg't, F, 5th Kentucky.	June 24, Sept. 17, 1863.	Right; circular; by A. Surg. J. K. Baudrey, U. S. V. Discharged Nov. 27, 1863; pensioned.
99	Peterson, P., Pt., I, 5th Wisconsin, age 48.	April 6, May 14, 1865.	Left; ant.-post. flap; by A. A. Surg. B. B. Miles; (caries.) Disch'd June 19, 1865.
100	Ramey, J., Corp'l, A, 70th Ohio.	April 6, M'y 8,'62.	Left; by A. A. Surg. J. C. Hughes. Disch'd Aug. 8, 1862; pensioned.
101	Reiley, P., Serg't, F, 96th Pennsylvania.	May 10, 1864, 1865.	Right; circ., by Dr. G. L. Pancoast; (June 10,'64, amp. forearm.) Disch'd April 12, '65; pensioned.
102	Rose, J., Pt., B, 6th Tenn. Mt. Inf., age 28.	Mar. 24, April 25, 1865.	Right; circ.; by A. A. Surg. J. W. Taylor; (gangrene; March 31, amp. forearm.) Disch'd June 20, 1865; pensioned.
103	Schwartz, N., Pt., F, 5th Michigan.	May 3, July 2,'63	Right. Discharged November 11, 1863; pensioned.
104	*Scott, N. W.*, Pt., F, 22d Miss., age 24.	No.30,'64 Ja.28,'65	Left; circ.; by A. A. Surg. R. McNulty. To P. Mar. Mar. 7, 1865.
105	Sharp, J. A., Pt., A, 3d New Jersey.	June 27, Sept. 22, 1862.	Right; double flap; by A. A. Surg. J. Neill. (June 27, exc. elb.) Dis'd Jan. 5,'63; pens'd. *Spec.* 225.
106	Simonson, F., Pt., B, N. Y. H. A., age 19.	June 18, Jul. 22,'64	Right; circ.; by A. A. Surg. W. C. Fryer; (gang.) Dis'd June 15,'65.
107	Sipel, F., Serg't, 2d U. S. Infantry.	July 3, Aug. 15, 1863.	Left; skin flaps and circ. sect'n of muscle; by Surg. C. W. Jones. U. S. V.; Nov. 23, necrosed bone removed; hæmorrhage. To duty July 30, 1864; pensioned.
108	*Smith, A. J.*, Pt., F, 49th Tenn., age 23.	Nov. 30, Feb. 11, 1865.	Left; oval flap; by Surg. J. H. Brinton, U. S. V.; (carious.) Released April 13, 1865.
109	Smith, O. D., Corp'l, E, 30th Ohio, age 20.	June 27, Aug. 16, 1864.	Left; ant.-post. flaps; by Professor Hamilton; (June 27, ex. of three inches of ulna; gangrenous.) Disch'd April 17,'65; pensioned.
110	Snyder, C. H., Corp'l, C, 150th Penn., age 28.	July 3, Aug. 5, 1863.	Right; flap; by A. A. Surg. D. Hamilton; (also w'd of thorax.) Disch'd Feb. 13, 1864; pens'd.
111	Southwick, H. K., Pt., I, 3d Wisconsin, age 25.	May 15, June 15, 1864.	Left; circ.; by A. Surgeon M. C. Woodworth, U. S. V. Disch'd March 24, 1865; pensioned.
112	Stewart, S. C., Pt., I, 2d Maine.	July 21. Aug. 28, 1861.	Left; circular; by Surg. J. W. S. Gouley, U. S. A.; (erysip.) Dis'd Sept. 21, 1861; pensioned. Died Jan. 3, 1869. *Spec.* 350.
113	Stewart, J. A., Pt., A, 61st Penn., age 25.	May 12, June 27, 1864.	Left; ant.-post. flap; by Surg. D. W. Bliss, U. S. V.; (May 12, rem'l bones of hand; erysip.; also amp. finger, right hand.) Discharged March 16, 1865; pensioned.
114	Strain, N., Serg't, C, 9th V. R. C., age 28.	July 11, 1864. Feb. 15, 1865.	Left; circ.; by A. A. Surg. C. E. C. Darby; (hæm's; erysip.; gang.) Disch'd July 27, 1865; pens'd. *Specs.* 3686, 3727.
115	Sullivan, J. O., Pt., H, 73d New York.	May 5, J'e 5, '62.	Left; circ. To V. R. C. Disch'd July 26,'64. Died Oct. 11, 1866.
116	Taylor, D., Pt., H, 75th New York.	May 27, Jul. 14,'63	Right. Discharged Aug. 25,'63; pensioned.
117	Till, W. A., Pt., A, 23d Ohio.	Sept. 17, Oct. 24,'62	Right; flap; by A. A. Surg. E. Pulling. Disch'd Dec. 11, 1862; pensioned.
118	Travers, W. H., Pt., K, 128th New York, age 24.	Sept. 19, Dec. 6, 1864.	Left; circ.; by A. A. Surg. M. B. McCausland. Disch'd Feb. 3,'65; pensioned. *Specs.* 1575, 3913.
119	Turrell, J. D., H, 1st Michigan Cav.	Aug. 29, Oct. 2, 1862.	Right; flap; by A. A. Surg. A. E. Keyes. Disch'd Dec. 5, 1862; pensioned. *Spec.* 907.
120	Vanhorn, C., Pt., H, 16th Michigan.	Aug. 30, Oct. 21, 1862.	Left; circ.; by A. A. Surg. C. A. McCall, U. S. A.; (caries.) Discharged Feb. 23, 1863; pens'd. *Spec.* 331.
121	Vickers, J., Pt., B, 4th Ohio, age 44.	Aug. 25, Oct. 12, 1864.	Left; circ.; by A. A. Surg. T. F. Belton; (gangrene.) Discharged May 6, 1865; pens'd. *Spec.* 442.
122	Wagoner, J., Pt., B, 11th Pa. Res., age 19.	June 30, Sept. 14, 1862.	Left; by A. A. Surg. E. G. Waters; (Aug. 20, excision of ulna; necrosis.) Disch'd Nov. 29, 1862; pensioned. *Spec.* 427.
123	Welch, J. O., Pt., D, 9th Maine.	May 20, J'e 30,'64.	Left; by Dr. Leavitt. Disch'd Dec. 16, 1864; pensioned.
124	*Whitely, W. B.*, Pt., H, 35th Mo., age 25.	No. 30,'64, Jan. 2, 1865.	Left; ant.-posterior flap; by Surg. Brist, C. S. A. To Provost Marshal April 2, 1865.
125	Wilson, T. R., Pt., M, 3d Ill. Cav., age 32.	Aug. 25, Oct. 23, 1863.	Left; flap; by A. A. Surg. H. K. Hendee. Duty Feb. 25, 1864. Mustered out October 29, 1864.
126	Yeldon, A., Pt., A, 28th Mass., age 22.	Mar. 25, Ap. 28,'65	Right; flap; by A. A. Surg. T. E. Marsh. Discharged Sept. 22, 1865.
127	Young, E. F., Pt., D, 59th Ill., age 20.	De. 16,'64 Mar. 31, 1867.	Right; by Dr. J. Pogen; (excis. humerus Dec. 17.) Discharged July 12, 1865; pensioned.

§ *Fatal Cases.*—Thirty-five fatal secondary amputations of the arm at the middle third were practised—on the right side in eighteen, and on the left in seventeen instances. Twelve of the patients were in an unfavorable condition, having undergone previous operations, viz: Amputation of the forearm in two instances, of the hand in one, excision of the elbow joint in two, excision in the radius and ulna in five cases, ligation of the subclavian in one case, and of the brachial artery in one. Subsequently to amputation at midarm a tubular sequestrum five inches long was extracted in one case, and in another exarticulation at the shoulder was practised. In the course of the treatment there were eleven instances of consecutive bleeding, one of erysipelas, four of gangrene, and eleven of pyæmia.

Case 1701.—Lieutenant J. S. DeCamp, Co. C, 14th New York Cavalry, aged 24 years, was wounded near Alexandria, La., April 27, 1864, and entered St. James Hospital, New Orleans, on May 2d. Assistant Surgeon P. S. Conner, U. S. A., reported: "Gunshot wound of right elbow. The parts about the joint became much swollen and the suppuration profuse. On June 6th, circular amputation at the middle third of the humerus was performed by Assistant Surgeon P. S. Conner, U. S. A. Chloroform was used. The patient's constitutional condition was fair at the time of the operation, and better than it had been during the preceding two weeks. Upon examination of the amputated arm, it was found the ball had split off into the condyle of the humerus and opened the joint. The case progressed very favorably. June 29th, patient is walking about and has good appetite. He was transferred on July 10th." Surgeon A. Hammer, U. S. V., reported his admission to the Marine Hospital, St. Louis,

on July 17th, and his condition as follows: "Stump in a high degree of inflammation and suppuration; patient quite feeble, and unable to sleep from pain in wound. On July 18th, a counter-opening was made near the shoulder joint, and about thirty-six ounces of pus were evacuated. Dressings with Labarraque's solution were applied, and quinine, morphia, and stimulants were given. The patient died, of phlegmonous inflammation of the stump and axilla, on July 26, 1864."

CASE 1702.—Private G. S. Hicks, Co. A, 12th New York, aged 40 years, was wounded at Bull Run, August 30, 1862, and admitted to Mount Pleasant Hospital, Washington, on the following day. Assistant Surgeon C. A. McCall, U. S. A., contributed the specimen (FIG. 557), with the following notes of the case: "Compound comminuted fracture of right ulna; operation on October 2d; death on October 8, 1862. The treatment was cold-water dressings to the parts, with tonics and stimulants constitutionally, it being attempted to save the limb. But extensive inflammation set in, with profuse discharge, rendering amputation necessary. Teale's operation was performed. The patient, whose strength had been greatly reduced by the profuse suppuration, began to fail rapidly, and died, six days after the operation, of pyæmia." The specimen consists of "the upper halves of the bones of the right forearm and the lowest third of the humerus; the ulna was shattered throughout the upper third of the shaft and the fragments necrosed."—(*Cat. Surg. Sect.*, 1866, p. 189.)

FIG. 557.—Shot comminut'n of ulna, after amputation. *Spec.* 166.

CASE 1703.—Corporal J. B. Rogers, Co. K, 57th Massachusetts, aged 30 years, was wounded at Petersburg, June 17, 1864, and admitted to the field hospital of the 1st division, Ninth Corps. Surgeon M. K. Hogan, U. S. V., noted: "Wound of left hand by minié ball; amputation of second finger, and removal of last two fingers with excision of last two metacarpal bones." On June 24th, the patient entered Emory Hospital at Washington, where the arm was amputated on July 19th. Acting Assistant Surgeon E. B. Harris forwarded the pathological specimen (FIG. 558), consisting of "the lower extremities of the bones of the forearm, the scaphoid, semilunar, cuneiform, trapezium, trapezoid, and the first two metacarpals, showing the bones entering the articulation to be carious." The remainder of the bones of the hand had been removed on the field. The following description of the case was transmitted with the specimen: "From the effects of disease of the soft parts it was found best to remove the limb at the middle third of the arm. Death resulted on the morning of July 26, 1864." The stump of the amputated limb was also contributed to the Museum (*Cat. Surg. Sect.*, 1866, p. 136, *Spec.* 2894) by Dr. Harris, who described the *post-mortem* appearances as follows: "No union of flaps save a slight degree of granulation at the bottom of the wound; soft parts around the bone remaining healthy, with an appearance of general inactivity of the muscular tissues; the medullary substance of a dark grumuous character and showing evidence of disease."

FIG. 558.—Necrosis after shot perforation of the carpus. *Spec.* 2852.

Remarks.—Nine of the cases of the above group are represented in the Museum by pathological preparations. Two are figured above (FIGS. 556, 557). *Spec.* 2894 belongs to CASE 1701, and is the upper half of the humerus, showing the effects of osteitis. *Spec.* 443 is a necrosed stump of the humerus a month after amputation. *Specs.* 2810 and 3497 are preparations of the bones of the forearm, showing extensive excisions in the shafts of the radius and ulna. *Spec.* 64 is a beautiful preparation of the upper portions of the left ulna and radius seven months after amputation—the extremities greatly developed by osteoporosis. *Spec.* 399 represents a shot fracture above the condyles without much comminution. *Spec.* 3103, caries after shot fracture of the upper thirds of the left radius and ulna. In the case of Thompson (No. 33 of the Table), Dr. S. Teats reports that "numerous metastatic foci in the lungs were found at the autopsy."

TABLE LXXXVII.

Condensed Summary of Thirty-five Unsuccessful Cases of Secondary Amputations in the Middle Third of the Arm.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Allen, C. W., Corp'l, K, 8th Conn., age 21.	May 16, June 27, 1864.	Right; ant.-post. flap; by A. Surg. D. R. Brown, U. S. V. Died July 7, 1864, exhaustion.	8	Eastwood, J. H., Pt., D, 24th N. Y. Cav., age 45.	June 18, Aug. 17, 1864.	Left; circ.; by A. A. Surg. J. H. Thompson. Died Aug. 22, 1864, exhaustion. *Spec.* 3103.
2	Andrews, G., Serg't, F, 69th Ohio, age 25.	Sept. 1, Oc. 17, '64.	Right; circular; (ulna necrosed.) Died November 12, 1864.	9	Eddy, E. S., Pt., K, 95th Pennsylvania.	June 27, Jul. 30, '62	Right; (necrosis.) Died August 1, 1862. *Spec.* 399.
3	Borden, J. W., Pt., D, 31st Maine, age 25.	June 18, Aug. 1, 1864.	Right; circ.; by A. A. Surg. B. F. Butcher; (gangrene.) Died Aug. 2, 1864, exhaustion.	10	Findall, C. H., Pt., D, 3d Delaware, age 23.	June 18, Sept. 1, 1864.	Left; circ.; by A. A. Surg. A. N. Brockway. Died September 21, 1864, pyæmia.
4	Bose, W., Pt., H, 17th N. Y., age 27.	Sept. 1, Nov. 6, '64	Right; circular; by A. A. Surg. L. Sinclair. Died Dec. 6, '64, pyæm.	11	Fitzgerald, M., Pt., B, 148th N. Y., age 20.	May 16, June 16, 1864.	Left; circ.; by Surg. A. P. Frick, 103d Pa.; (June 11, hæm.) Died June 19, '64. hæm'ge and shock.
5	Boyd, R., Pt., K, 47th N. Y., age 20.	Oct. 7, Dec. 7, '64	Right; circ.; by A. A. Surg. S. D. Farrell. Died Dec. 19, '64, pyæm.	12	Foley, M., Pt., D, 42d Indiana, age 44.	May 15, July 1, '64	Left. Died July 18, '64, chronic diarrhœa.
6	De Camp, J. S., Lieut., C, 14th N. Y. Cav.	April 28, June 6, 1864.	Right; circular; by A. Surg. P. S. Conner, U. S. A. Died July 26, 1864, phlegmonous inflamma'n.	13	Greenough, F., Pt., C, 7th N. H., age 18.	Se. 29, '64. Jan. 3, '65.	Right; (hæm.; necrosis.) Disch'd Sept. 11, '65. Died Sept. 22, '65.
7	Dickinson, N. S., Pt., C, 25th Mass., age 27.	June 3, July 21, 1864.	Left; circ.; by A. A. Surg. T. H. Snow; (July 2, exc. elb. joint;) July 31, gangrene. Died Aug. 7, 1864; exhaustion.	14	Harrison, D., Pt., D, 94th Ohio, age 34.	May 14, June 24, 1864.	Right; ant.-posterior flap; by A. A. Surg. H. C. May; (June 17, lig. radial and exc. radius; June 24, hæm.) Died July 2, '64. *Spec.* 3497.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
15	Heatherly, J., Pt., E, 11th W. Va., age 35.	Oct. 28, 1864, Jan. 4, 1865.	Left; circular; by A. Surg. W. A. Banks, U. S. V.; (Oct. 29, excis. radius and ulna; hæmor'gs; lig. brach.) Died Jan. 24,'65, pyæm.
16	Henry, A., Pt., I, 142d N. Y., age 31.	Aug. 25, Sept. 25. 1864.	Right; flap; by Surg. A. Chapel, U.S.V.; (Aug.25, amp. forearm.) Died Oct. 9, 1864, exhaustion.
17	Hicks, G. S., Pt., A, 12th N. Y., age 40.	Aug. 30, Oct. 2, 1862.	Right; rectangular flaps; by A. Surg.C.A. McCall, U.S.A. Died Oct. 8, 1862, pyæmia. *Spec.* 166.
18	*Hobbs, J. M.*, Pt., K, 32d Texas.	Mar. 28, April 29, 1865.	Left; circ.; by Surg. C. H. Mastin, C. S. A.; July 10, sequestrum removed. Died Aug. 3,'65, pyæm.
19	Hoffman, A. J., Pt., E, 26th Iowa, age 55.	Jan. 11, Mar. 12, 1863.	Right; erysipelas; necrosis; May 10, amp. at shoulder joint. Died June 3, 1863, pyæmia.
20	Howell, E., Pt., H, 9th Iowa Cav., age 20.	Sept. 6, Nov. 15, 1864.	Left; double flap; by A. Surg. L. Lycan, 54th Ill.; (Nov. 15, hæm.) Died Dec. 14, 1864, exhaustion.
21	Isherwood, J., Pt., E, 4th Delaware, age 60.	June 18, Aug. 21, 1864.	Right; circ.; by A. A. Surg. J. A. McArthur. Died Oct. 1, 1864, inflammation of the brain.
22	Jones, W., Pt., G, 77th Penn., age 32.	Aug. 5, Nov. 14, 1864.	Left; circ.; by A.A. Surg. L. Sinclair; (Sept. 10, excis. radius.) Died January 7, 1865.
23	Kelley, J., Pt., G, 95th New York, age 19.	May 10, June 13, 1864.	Left; flap; by A. A. Surg. E. De Witt; (June 13, hæmorrhage.) Died June 19, 1864, pyæmia.
24	McCready, J. S., Capt., H, 126th Ohio, age 35.	May 10, July 6, 1864.	Left; flap; by Surg. N. R. Moseley; (hæm's; May 20, lig. radial; ulna excised; hæmorr's and necrosis.) Died Sept. 7, 1864. *Spec.* 2810.
25	Miller, G., Pt., I, 93d Ohio, age 27.	June 5, Jul. 12,'64	Right; circ.; by Surg. S. E. Fuller, U.S.V. Died Jul. 28,'64, ch.diar.
26	*Neill, I.*, Pt., D, 16th Miss., age 38.	Au. 21,'64 April 12, 1865.	Left; circ.; by A. A. Surg. N. A. Robbins; (Aug. 22, amp. forearm.) Died Apr. 18,'65, pyæm. *Spec.* 64.
27	Phillips, J., Pt., E, 3d Md. Cav., age 26.	Mar. 4, May 27, 1864.	Left; circ.; by A. A. Surg. R. W. W. Carroll; (March 4, excis. radius; hæmorrhages.) Died May 16, 1865, exhaustion.
28	Richardson, O. B., Serg't, E, 32d Maine, age 21.	June 3, July 15, 1864.	Right; by Dr. E. Russell; (hæmorrhage; July 5, lig. brachial.) Died from exhaustion.
29	Rogers, J. B., Corp'l, K, 57th Mass., age 30.	June 17, Jul. 19,'64	Left; (June 17, partial amp. hand.) Died July 26, 1864. *Specs.* 2852, 2894.
30	Sawtell, W., Pt., F, 25th Mass., age 33.	May 14, J'e 19,'64.	Left; circ.; by A.A. Surg. J. Moneypenny. Died July 26, 1864, exhaustion.
31	Smith, A. H., Pt., F, 25th Iowa, age 30.	Jan. 11, M'h 12,'63	Right; (sec. hæm.; lig. subclav.;) hæm. Died April 14, 1863, exhaustion.
32	Smith, J., Pt., B, 24th Ill., age 34.	Sept. 20, Oc. 28,'63.	Left; flap. Died October 29,'63.
33	Thompson, A., Pt., A, 100th Penn., age 19.	Sept. 14, Oct. 16, 1862.	Right; circ.; by A. A. Surg. S. Teats; Oct. 17, hæmorrhage. Died Nov. 1, 1862, pyæmia.
34	Van Dyke, J., Pt., K, 107th N. Y., age 24.	July 3, Aug. 24, 1863.	Right, circ.; by A. A. Surg. E. Martin; (July 4, exc. ulna.) Died Sept. 12,'63, hec. fever. *Spec.* 443.
35	Wyatt, L. D., Pt., I, 24th Missouri.	April 9, May 16, 1864.	Left; ant.-post. flap; by A. A. Surg. S. S. Jessop. Died June 2, 1864, pyæmia.

3. Secondary Amputations of the Arm at the Lower Third.—There were sixty-one operations in this group with a fatality of 39.3. Two of the patients were Confederates. Twenty-five of the patients had undergone antecedent operations.

§ *Successful Cases.*—There were thirty-seven recoveries after secondary amputations at the lower third,—the left limb was involved in twenty-four, and the right in thirteen instances. One of the patients suffered also from a serious flesh wound of the thigh, and eighteen had already submitted to operative interference.[1] There were no ulterior operations except torsion, or deligation of small arteries on the face of some of the stumps. Nine cases were complicated by consecutive bleeding, ten by sloughing, and five by erysipelas.

Case 1704.—Private Isaac Martz, Co. B, 184th Pennsylvania, aged 39 years, was wounded at Cold Harbor, June 3, 1864. A conoidal ball shattered the middle phalanx of the right middle finger, which was disarticulated at the second joint at a Second Corps hospital. Surgeon T. R. Spencer, U. S. V., reported the patient's admission to an Alexandria hospital on June 7th, and his transfer to Pennsylvania a few days subsequently. Acting Assistant Surgeon J. G. F. Strowbridge recorded the patient's admission to the hospital at Chester, Pennsylvania, on June 12th, with diffuse suppuration of the palm of the hand following an amputation of the middle finger, with much sloughing of the connective tissue and tendons. The metacarpals had become carious, and on June 30th amputation of the lower third of the forearm by circular incision was performed by Dr. Strowbridge. The external appearances of the parts removed are shown in the wood-cut (Fig. 559), drawn from the wet preparation contributed by the operator. Dr. Strowbridge adds that the case progressed favorably for a month, but this report is not confirmed by the subsequent history of the case. Acting Assistant Surgeon G. S. Stein reported, when he took charge the succeeding month, that "the whole stump was in a diseased state, and the radius and ulna necrosed in their entire extent." Excessive swelling, with purulent infiltration of the soft parts of the forearm, was not relieved by incisions and fomentations, and it was finally decided to re-amputate the limb in the continuity of the upper arm. The amputation at the lower third of the arm by circular incision was performed April 4, 1865, by Dr. Stein. The parts removed were contributed to the Museum, and present a striking illustration of the results of destructive osteomyelitis after amputation.

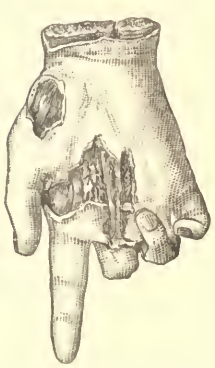

Fig. 559.—Hand disorganized after amputation of the middle finger for shot fracture. *Spec.* 551.

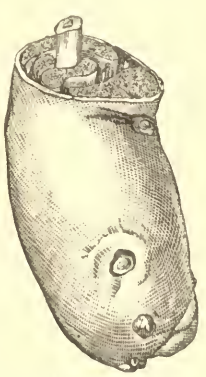

Fig. 560.—Stump of forearm, from a re-amputation for osteomyelitis. *Spec.* 2672.

The soft tissues of the stump of the forearm, represented in the wood cut (Fig. 560), are preserved as a wet preparation. The bones are represented in Plate XLIV, opposite. What remained of the shafts of the radius and ulna has perished and is sur-

[1] As follows: Five had undergone amputation of the forearm; four, amputations of fingers or portions of hand; excision of the elbow joint had been practised in 2 cases; excision in the shaft of the humerus in 1 case; excision in the radius or ulna in 4 cases; ligation of the brachial artery in 2 cases.

PLATE XLIV. NECROSIS OF THE RIGHT RADIUS AND ULNA.

No. 4170. SURGICAL SECTION.

rounded by huge involucra. There is a slight erosion of the cartilages of the head of the radius, but not much other evidence of disease of the structures of the joint. This soldier was discharged from service June 26, 1865, and pensioned. He was paid September 4, 1875.

CASE 1705.—Sergeant C. J. G———, Co. D, 16th New York, age 21 years, was wounded at South Mountain, September 14, 1862. He was sent from a Sixth Corps field station to the hospital at Burkettsville, where Surgeon Henry Janes, 3d Vermont, reported that "a musket ball had entered just behind the head of the left radius, and, passing downward and forward, emerged near the middle of the forearm, having comminuted the ulna for two inches beyond the joint. It was determined to save the limb if possible; but the patient became so weak from the profuse discharge, and the arm remaining too much swollen to admit of resection, and a large abscess having formed about the joint, it became necessary to amputate the arm, which was done on November 14, 1862, and the patient was a few days afterward sent to Frederick." Assistant Surgeon T. G. MacKenzie, U. S. A., reported his admission to Camp B hospital, his favorable convalescence, and his discharge from service March 5, 1863. The pathological specimen, represented in the adjacent wood-cut (FIG. 561), was contributed to the Museum by the operator, Dr. Jones. Gardiner was pensioned, and supplied with an artificial limb by Mr. Lincoln. This pensioner was in good health in June, 1875.

FIG. 561.—Shot comminution of upper ends of ulna and radius. *Spec.* 775.

CASE 1706.—Charles R——, a substitute, aged 20 years, was wounded at Philadelphia, October 17, 1863. While attempting to escape, he was fired upon by the sentinel. He was removed to the Broad and Cherry Streets Hospital, whence Acting Assistant Surgeon W. V. Keating reported: "The ball entered on the inner side of the left forearm at the upper third, passed obliquely across and slightly downward, and came out on the radial side in the middle third, fracturing the radius in its course and injuring the radial artery. The wound was a severe one and the radius was greatly comminuted. The patient was apparently in very good condition, though his system was probably somewhat reduced from too free indulgence in alcoholic stimulants; pulse and secretions normal. Acting Assistant Surgeon A. Hewson made an incision two inches long and ligated the brachial artery at its middle third; about twelve ounces of blood was lost. The patient did well for a day or two, when considerable constitutional disturbance became manifest, and, by October 21st, the wound produced by the ball had sloughed extensively. October 31st, a slight oozing hæmorrhage occurred at wound of ligation, which was controlled by the tourniquet. The sloughing ceased about November 7th, and the wound commenced granulating and healed very rapidly, the constitutional condition of the patient at the same time improving greatly. By December 6th the wound had nearly granulated over, but there was still some discharge from the point of exit of the ball. His system generally was in pretty good condition. The wound, however, again took on unhealthy action, necrosis set in, and on January 7, 1864, amputation of the left arm, at the lower third, was performed by Acting Assistant Surgeon E. Livezey." The patient recovered, and was discharged from service November 28, 1864.

TABLE LXXXVIII.

Condensed Summary of Thirty-seven Cases of Recovery after Secondary Amputation in the Lower Third of the Arm.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Allard, P., Pt., F, 17th Vermont, age 43.	May 18, Jul.30,'64	Right; (exc. May 18; gang.; hæm.) Disch'd Dec. 21, 1864; pens'd.
2	Ashford, J., Pt., B, 17th Kentucky, age 22.	June 18, Oct. 1, 1864.	Right; circ.; by Surg. J. R. Ludlow, U.S.V.; (exc. June 18.) Discharged Mar. 25, 1865; pens'd.
3	Burns, W. W., Pt., E, 91st Penn., age 28.	June 18, Sept. 30, 1864.	Right; circ.; by A. A. Surg. G. P. Sargent; (amp. finger June 18; amp. forearm Aug. 1.) Disch'd July 31, 1865; pensioned.
4	Butler, J., Pt., C, 22d Iowa.	May 22, June 29, 1863.	Right; (amp. finger May 22; phlegmonous erysipelas.) Died Sept. 9, '65, typhoid fever. *Spec.* 1708.
5	Centre, S., Pt., B, 3d Vermont, age 28.	June 3, July 25, 1864.	Right; circ.; by A. A. Surg. W. R. Stavely; (erysip.; necro.) Dis'd Feb. 2, '65; pens'd. *Spec.* 3616.
6	Clark, G. D., Pt., K, 140th N. Y., age 23.	May 5, Sept. 16, 1864.	Left; flap; by A. A. Surg. D. F. Elton; (erysip.; necro.) Disch'd Apr. 10, '65; pens'd, *Spec.* 3629.
7	Cochran, G. R., Pt., G, 8th N. Y. fl. A.	June 22, Au.20,'64	Left; flap; by A. A. Surg. S. Smith. Disch'd Jan. 20. 1865; pens'd.
8	Cosier, J. A., Private, D, 125th N. Y., age 30.	May 10, J'e 23,'64.	Left; circ.; by Dr. Thorn. Discharged Feb. 1. 1865; pens'd.
9	Crisman, W., Pt., B, 24th Iowa.	April 8, May 13, 1864.	Left; double flap; by Surg. F. Bacon, U. S. V. Dis'd June 10, '64; pensioned.
10	Cullen, R. J., Serg't, F, 9th New Hampshire, age 22.	May 12, July 14, 1864.	Right; circ.; by A. A. Surg. G. E. Brickett; (gang.) Disch'd June 5, 1865; pensioned.
11	*Faucett, W. F.*, Pt., E, 13th North Carolina.	July 1, Se.23,'63.	Left. Exchanged March 17, '64. *Spec.* 2073.
12	Fritsche, W., Serg't, M, 12th Pa. Cav., age 24.	Mar. 21, May 14, 1865.	Left; circ.; by Surg. J. B. Lewis, U. S. V.; (hæm's: lig. brachial.) Disch'd June 27, 1865; pens'd.
13	Gannon, J., Pt., D, 126th Ohio, age 42.	Sept. 22, Nov. 7, 1864.	Left; flap; by A. A. Surg. C. W. Stinson; (exc. Sept. 22.) Disch'd June 23, 1865; pensioned.
14	Gardiner, C. J., Pt., D, 16th N. Y., age 21.	Sept. 14, Nov. 14, 1862.	Left; circ.; by Surg. H. Janes, 3d Vermont. Discharged March 5, 1863; pensioned. *Spec.* 775.
15	Glancey, F., Pt., G, 12th New Hampshire, age 21.	June 29, Aug. 18, 1864.	Left; by A. A. Surg. T. W. Leibold; (amp. forearm June 29; hæm.) Dis'd Dec. 29,'64: pens'd.
16	Hacket, G., Lieut., A, 10th N. Y., age 20.	May 6, July 9, 1864.	Right; circ.; by A. A. Surg. J. W. Polie; (exc. May 6, '64; gang.) Disch'd May 26, 1865; pens'd.
17	Hendricks, S. J., Pt., A, 183d Penn., age 19.	May 7, Aug. 25, 1864.	Left; circ.; by A. A. Surg. S. A. Cummins; (amp. finger May 7.) Pens'd Dec. 12, 1864; *Spec.* 3617.
18	Hutton, W. McL., Pt., H, 147th Illinois, age 32.	April 3, May 4, 1865.	Left; circ.; by A. A. Surg. S. A. Baxter; (gangrene.) Discharged Nov. 23, 1865; pensioned.
19	Johnson, J., Corp'l, F, 82d Col. Troops, age 30.	April 2, J'e 1, '65.	Right; flap; by A. A. Surg. J. C. Richards. Disch'd; pensioned.
20	Jolly, J., Pt., E, 83d Penn., age 27.	Oct. 1, Dec. 19, 1864.	Left; flap; by A. A. Surg. E. B. Harris; (amp. forearm Oct. 1,'64; erysip.; gang.; symp. pyæmia.) Disch'd June 1, 1865; pensioned. Died Jan. 18, 1868.
21	Killan, C., Corp'l, H, 2d Michigan.	May 31, July 3, 1862.	Right; by A. A. Surg. T. B. Castle; (ex. June 4,'62; symp. pyæ.) Disch'd Aug. 15, 1862; pens'd.
22	Martz, I., Corporal, B, 184th Penn., age 39.	J'e 5, '64. April 9, 1865.	Right; circ.; by A. A. Surg. G. S. Stein; (amp. finger June 5, and forearm June 30; hæm.; necro.) Disch'd June 26, 1865; pens'd. *Specs.* 551, 2672, 4170.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
23	*Mathews, B. W.*, Serg't, E, 47th North Carolina, age 28.	July 3, Oct. 25, 1863.	Left; circ.; by A. A. Surg. J. E. Steele; (erysip.; amp. forearm Aug. 30; erysipelas; necrosis.) To prison April 19, 1864.	30	Rease, C., Substitute for conscript, age 20.	Oc.17,'63, Jan. 7, 1864.	Left; flap; by A. A. Surg. E. Livezey; (hæm.; lig. brachial; necrosis.) Disch'd Nov. 28, 1864.
24	McCabe, J., Pt., F, 69th New York, age 40.	June 22, 1864, July 11, 1865.	Left; circ.; by A. Surg. S. H. Orton, U. S. A.; (exc. June 22, '64.) Disch'd Oct. 14, '65; pensioned. Died Dec. 27, 1867.	31	Renville, N., Pt., K, 76th Illinois, age 17.	July 7, Au. 24,'64	Left; circ.; by Surg. E. Powell, 72d Ill. Disch'd Oct. 12,'64; pens'd.
25	McDaniel, S., Pt., F, 140th Penn., age 29.	May 12, June 27, 1864.	Right; circ.; by A. A. Surg. J. S. Newcombe. Disch'd Dec. 6,'64; pensioned.	32	Rosa, F., Pt., G, 24th Iowa.	May 16, Au. 15,'63	Right; circular; (amp. forearm May 16; gangrene.) Dis'd Sept. 16, 1863; pensioned.
26	Miller, J., Pt., D, 48th Penn., age 40.	May 12, June 15, 1864.	Left; circ.; by A. Surg. W. Webster, U. S. A. Disch'd March 15, 1865; pensioned.	33	Schmidt, G., Corp'l, E, 64th New York, age 31.	June 3, Aug. 30, 1864.	Left; circ.; by A. A. Surg. J. H. Thompson; (necrosis.) Disch'd Jan. 19, 1865. *Spec.* 3180.
27	Murphy, J., Pt., H, 162d New York, age 24.	Apr. 9,'64, Aug. 1, 1865.	Circ.; by A. Surg. S. H. Orton, U. S. A.; (necrosis;) gangrene. Discharged Nov. 7, 1865; pens'd.	34	Settell, R., Sergeant, E, 10th Michigan, age 26.	Feb. 25, June 14, 1864.	Left; circ; by A. A. Surg. T. H. Hammond; (necrosis.) Disch'd May 12, 1865; pensioned.
28	Parsons, C., Corp'l, H, 32d Colored Troops, age 35.	Feb. 9, Mar. 21, 1865.	Circ.; by A. Surg. W. R. Way, U. S. V.; (hæmorrhage.) Disch'd June 5, 1865; pensioned.	35	Smith, R. A., Pt., B, 67th New York, age 45.	J'e 27,'62, Feb. 22, 1863.	Right; double flap; by A. A. Surg. E. A. Smith; (excision June 27.) Disch'd April 14, 1863; pens'd.
29	Rapp, A. G., Serg't, H, 138th Pennsylvania.	Nov. 8, 1863, Second'y.	Left; flap; by A. Surg. H. Allen, U. S. A.; (amp. forearm Nov. 8; gang.) Dis'd Apr. 12,'64; pens'd.	36	Sullivan, P., Pt., E, 11th Mass., age 40.	June 16, Sept. 19, 1864.	Left; ant.-post. flap; by A. A. Surg. A. C. Cobb; (necrosis.) Disch'd Mar. 16,'65; pens'd. *Spec.* 3329.
				37	Tennant, C., Pt., B, Purnell Legion, age 20.	Aug. 21, Sept. 24, 1864.	Left; flap; by A. A. Surg. B. B. Miles; (hæm's; gang.) Disch'd April 28, 1865; pensioned.

Ten pathological specimens were preserved for the Museum from eight of the thirty-seven successful secondary amputations.[1]

§ *Fatal Cases.*—The twenty-four fatal secondary amputations of the arm at the lower third were equally divided between the two extremities. Thirteen were practised by the circular and eleven by flap methods. Seven patients had undergone previous operations.[2] Death was ascribed to pernicious fever in one case, to diarrhœa in four, to diphtheria in one, to exhaustion from profuse suppuration in seven, and to pyæmia in eleven cases. Four cases were complicated by secondary hæmorrhage, eight by gangrene, and three by erysipelas.

FIG. 562.—Lesion after shot fracture of the elbow. *Spec.* 2104.

CASE 1707.—Private A. J. Daniels, Co. F, 25th Illinois, was wounded at Mission Ridge, November 25, 1863, and admitted to the field hospital of the 1st division, Twentieth Corps. Surgeon L. D. Waterman, 39th Indiana, recorded: "Wound of arm; severe." On December 1st, the wounded man entered the general field hospital at Chattanooga, whence Acting Assistant Surgeon R. Bartholow, U. S. A., contributed the specimen (FIG. 562), with the following statement of the case: "Private Daniels was wounded while in the act of firing, the ball striking the inner condyle of the humerus and emerging two inches above. The wound became sloughy and unhealthy, the limb œdematous, and general health impaired. The arm was amputated, at the lower third, on January 17th. The patient died on January 26, 1864, with symptoms of pyæmia." The specimen consists of the right elbow, the outer condyle and greater portion of the trochlea being shot away, and the olecranon; the fractured extremity and the head of the radius carious and partially absorbed.

CASE 1708.—Private W. W. Hutton, Co. D, 16th New York, aged 23 years, was wounded in the left arm at South Mountain, September 14, 1862, and entered Hospital D, at Burkittsville, on October 1st. Surgeon H. Janes, 3d Vermont, contributed the specimen (FIG. 563), with the following report: "The ball entered the hollow of the elbow and passed through the joints, slightly fracturing the external condyle of the humerus. Considerable sloughing of the soft parts followed, and the patient became much exhausted by the discharge and an obstinate diarrhœa. On November 14th, amputation was performed at the lower third, it having been decided upon as giving the patient the best chance of life. The operation had been delayed for several days on account of an erysipelatous inflammation of the arm. The patient died of exhaustion two hours after the operation." The specimen consists of the bones of the left elbow, showing the articular surfaces to be destroyed by caries.—(*Cat. Surg. Sect.*, 1866, p. 161.)

FIG. 563.—Caries after shot wound of elbow. *Spec.* 786.

There were no autopsies referred to in this series; but twelve pathological specimens were preserved,[3] two of which are figured above. Several of the others, enumerated in the succeeding tabular statement, are well worthy of examination.

[1] Three are shown in FIGS. 559, 560, 561, and one in PLATE XLIV. The six others illustrate various alterations of the bones of the forearm after injury, and may be referred to in the Catalogue through the number in the Table.

[2] As follows: Amputation in forearm of same side in 1 case; disarticulation at wrist in 1; excision in radius in 1; amputations of portions of hand in 2; incision for extraction of ball in 1; ligation of interosseous artery in 1 case.

[3] Besides the two preparations figured in the text (FIGS. 562, 563) are two of destructive caries of the elbow, five of various alterations in the bones of the forearm, and three of lesions of the carpal and metacarpal bones.

TABLE LXXXIX.

Condensed Summary of Twenty-Four Unsuccessful Cases of Secondary Amputations in the Lower Third of the Arm.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Alltop, G. N., Pt., B, 7th West Virginia, age 22.	No. 27,'63 Jan. 5, 1864.	Left; flap; by Surg. S. N. Sherman, U.S.V.; (hæm.; necrosis; erysip.) Died Jan. 23, 1864, pyæmia.
2	Bacon, C., Pt., 1st Conn. Battery, age 24.	May 16, July 4,'64	Left; circ.; by A. A. Surg. E. P. Filch. Died July 10,'64, pyæmia.
3	Bennett, G. A., Pt., I, 8th Ohio, age 20.	June 2, July 6, 1864.	Left; lateral flap; by Surg. N. R. Moseley, U.S.V. Died July 11, 1864, pyæmia. *Spec.* 2815.
4	Bessee, G. W., Pt., K, 58th Mass., age 19.	May 12, June 28, 1864.	Right; circ.; by A. A. Surg. F. G. H. Bradford; (erysipelas.) Died July 2, 1864, exhaustion.
5	Bowman, J., Pt., K, 20th Indiana, age 25.	July 2, Sept. 5, 1863.	Left; by A. A. Surg. T. G. Morton; (hæmorrhage.) Died Dec. 6,'63; diphth'a; gang. *Spec.* 2753.
6	Button, D., Pt., H, 149th New York, age 35.	May 25, July 21, 1864.	Right; circ.; by A. A. Surg. L. R. Yates; (amp. forearm June 12; gang.) Died Aug. 16,'64, ch. diar.
7	Carroll, M., Pt., G, 10th Connecticut, age 20.	May 13, Je 23,'64.	Right; flap. Died July 21, 1864.
8	Colby, H., Pt., K, 2d Conn. H. A., age 23.	May 12, June 14, 1864.	Right; double flap; by A. A. Surg. E. Seyffarth; (gangrene.) Died June 17, 1864, pyæmia.
9	Conrad, H., Pt., H, 10th N. Y. Cav., age 44.	May 7, Sept. 10, 1864.	Right; flap; by A. A. Surg. S. Smith; (exc. May 8, hæmorrh'e; gangrene.) Died Sept. 23, 1864.
10	Daniels, A. J., Pt., F, 25th Illinois.	No. 25,'63 Ja. 17,'64.	Left. Died January 26, 1864, pyæmia. *Spec.* 2104.
11	Gillespie, J. R., Pt., F, 27th Indiana, age 33.	Sept. 17, Nov. 13, 1862.	Right; circular; by A. Surg. J. J. Woodward, U. S. A. Died Dec. 22, 1862, phthisis. *Spec.* 332.
12	Hutton, W. W., —, D, 16th New York, age 23	Sept. 14, No. 14,'62	Left; (erysipelas.) Died Nov. 15, 1862, exhaustion. *Spec.* 786.
13	Ingalborg, M., Pt., K, 10th N. H., age 21.	Au. 23,'64 Jan. 10, 1865.	Right; circ.; by A. A. Surg. G. Beebe; (necrosis;) signs of pyæmia. Died February 23, 1865.
14	Knox, F. M., Pt., D, 99th Penn., age 26.	May 5, Aug. 31, 1864.	Left; circ.; by A. A. Surg. E. C. Bullard. Died Sept. 16, 1864, exhaustion. *Spec.* 3627.
15	Lake, J. S., Serg't, H, 97th Ohio, age 40.	June 22, July 27, 1864.	Right; circular; by Surg. R. L. Stanford, U. S. V.; (gangrene;) pyæmia. Died Aug. 27, 1864, exhaustion.
16	Lehman, C. A., Pt., F, 74th New York.	July 2, Aug. 2,'63	Left. Died August 10, 1863, pyæmia. *Spec.* 2790.
17	Mackey, S., Pt., A, 10th Penn. Reserves.	June 28, Au. 21,'62	Right. Died September 30, 1862, pyæmia.
18	O'Connell, J., Corp'l, D, 63d N. Y., age 41.	June 3, July 11, 1864.	Left; circ., by A. A. Surg. R. A. Cleemann; (hæmorrhage.) Died July 16, 1864, exhaustion.
19	Powell, W., Pt., H, 65th Indiana, age 28.	March 7, Apr. 14, 1864.	Right; circular; by Surg. G. Grant, U.S.V.; (gangrene.) Died Aug. 25, 1864, chronic diarrhœa.
20	Smith, G., Pt., G, 21st Penn. Cav., age 20.	June 22, Sept. 17, 1864.	Left; circ.; by A. A. Surg. J. T. Laning; (amp. finger June 22; forearm July 9.) Died Oct. 7,'64, bilious intermittent fever.
21	Springer, J., Pt., B, 35th Iowa, age 22.	April 9, June 23, 1864.	Left; circ.; by A. A. Surg. F. Hasenburg. Died July 26, 1864, exhaustion; chronic diarrhœa.
22	Thompson, J. C., Pt., B, 17th Pa. Cav., age 43.	June 12, Sept. 20, 1864.	Left; circ., by A. A. Surg. M. K. Knorr; (gangrene; disarticulation of wrist July 15.) Died Oct. 17, 1864, pyæmia. *Spec.* 3674.
23	Thorncroft, D., Serg't, I, 20th Conn., age 27.	July 20, Aug. 25, 1864.	Right; flap; by A. Surg. B. E. Fryer, U.S.A. Died February 11, 1865, pyæmia.
24	Wallace, A., Pt., B, 1st Mich. S. S., age 23.	May 12, June 14, 1864.	Right; circ.; by A. A. Surg. F. M. Lincoln; (gangrene.) Died June 23, 1864, pyæmia. *Spec.* 2878.

4. Secondary Amputations of the Arm without Indication of the Seat of Incision.—Fifteen cases of secondary amputation of the upper third of the upper arm were reported in which the precise seat of operation was not specified. Six were successful, and nine terminated fatally, a mortality rate of 60 per cent. All of the patients were Union soldiers. The operations were practised on the right side in nine cases, on the left in five, not reported in one. There had been antecedent excisions in the shaft of the humerus in one case, of the bones of the elbow joint in two cases, and in the radius in two cases. The deaths are referred to secondary hæmorrhage, exhaustion, and pyæmia—the larger proportion to the latter cause. The successful and fatal cases are enumerated together.

CASE 1709.—Private J. Sehe, Co. C, 165th New York, aged 40 years, was wounded at Port Hudson, May 27, 1863, and admitted to the field hospital of the 2d division, Nineteenth Corps, where Surgeon E. F. Sanger, U. S. V., recorded: "Gunshot wound of right arm, lower third." Two days afterward he entered University Hospital, at New Orleans. Assistant Surgeon P. S. Conner, U. S. A., forwarded the specimen (FIG. 564), with the following report: "The ball passed through the arm nearly transversely, just above the elbow. The lower portion of the humerus was found much comminuted, the fracture extending into the elbow joint. On June 9th, the fractured portion of the humerus, together with the articulating extremities of the radius and ulna, were removed. Case doing well." The specimen consists of the excised parts, three inches of the lower extremity of the humerus, and the upper extremities of the radius and ulna. The arm was subsequently amputated. On October 19, 1863, the patient was discharged from service by reason of "amputation of right arm." This pensioner was last paid on March 4, 1870, since which date he has not been heard from.

FIG. 564.—Excised elbow, comminuted by shot. *Spec.* 1309.

The case is interesting as illustrating the result of an attempt at conservative excision when the fissures from an antero-posterior perforation of the condyloid portion of the humerus obviously extended far up the shaft. The fifteen cases of this group are enumerated in the table on the next page. The reports were very imperfect, and there were no records of autopsies accompanying the nine fatal cases.

TABLE XC.

Condensed Summary of Fifteen Cases of Secondary Amputations of the Arm, the Point of Ablation Unspecified.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	Baldwin, J. F., Pt., C, 126th Ohio, age 34.	May 6, Jun. 6, '64.	Left; by Dr. J. D. Wortman. Discharged Jan. 8, 1865; pens'd.	9	Haller, M., Pt., C, 6th Connecticut.	Jul. 19, '63 Second'y.	Left. Died August 29, 1863, pyæmia.
2	Hawley, E., Pt., A, 14th Wisconsin.	June 15, Au. 31, '63	Right. Discharged October 2, 1863.	10	Hutton, J. C., Pt., E, 10th Missouri.	No. 25, '63, Second'y.	Right. Died.
3	McEvoy, J., Pt., D, 7th Missouri.	May 12, J'e 30, '63.	Right; gangrene. Disch'd Sept. 11, 1863.	11	Jones, M. E., Corp'l, F, 94th New York.	Sept. 17, Dec. 19, 1862.	Right; (exc. part of radius Oct. 15; caries.) Died December 30, '62. *Spec.* 487.
4	Mullen, H., Pt., E, 36th Illinois.	De. 30, '62, M'h 12, '63	Left; hæmorrhage; ligation brachial. Disch'd June 27, 1863.	12	Merritt, E. F., Pt., F, 34th Illinois.	Jan. 1, Feb. –, 1863.	Right; (excision shaft of humerus Jan. 17.) Died Feb. 26, 1863, exhaustion.
5	Sehe, J., Pt., C, 165th New York, age 40.	M'y 27, '63 Second'y.	Right; (exc. elb. June 9.) Disch'd Oct. 19, '63; pens'd. *Spec.* 1309.	13	Milton, J., Serg't, H, 25th Ohio.	July 1, Aug. 8, '63	Right; (hæmorrhage.) Died Aug. 9, 1863, hæmorrhage.
6	Tanner, M., Pt., G, 11th Michigan.	De. 31, '62, Se. 24, '63.	Right. Discharged Mar. 25, '64.	14	Reider, G., Corp'l, D, 73d Penn., age 21.	Au. 30, '62 Feb., '63.	Died March 12, 1863.
7	Anthoine, J., Serg't, D, 13th Illinois.	No. 27, '63. Jan. 1, '64.	Right; (exc. part of radius Nov. 27; gang.) Died Jan. 2, '64, pyæmia.	15	Wright, W., Private, C, 100th Penn.	June 3, Jul. 9, '64.	Left; by A. A. Surg. B. Leaman. Died Dec. 20, 1864.
8	Eustis, W., Pt., C, 7th Wisconsin, age 23.	May 5, '64 Second'y.	(Excision of elbow May 27, 1864.) Died July, 1864.				

This group completes the record of the secondary amputations of the arm,[1] and also of all that portion of the entire series of amputations of the arm in the continuity for shot injury in which the period of operation was determined, an aggregate of forty-five hundred and seventy-two operations. We have yet to consider those cases of arm amputations in which the date of injury or of operation was uncertain.

AMPUTATIONS IN THE CONTINUITY OF THE ARM, OF UNCERTAIN DATE.—Eight hundred and eighty-four cases of amputation of the arm for shot injury are placed in this category, as the intervals between the injuries and operations are unknown, one or other of the dates having been omitted in the reports. The cases are subdivided into four groups, according as the ablations were practised in the upper, middle, or lower thirds, or at an unspecified portion of the upper arm. These groups, in turn, are each separated into series of successful, unsuccessful, and undetermined cases.

In one hundred and eighty-three cases, after diligent investigation, the results as to fatality could not be ascertained. In the series of seven hundred and one determined cases there were two hundred and twenty-eight deaths, a mortality rate of 32.5 per cent. Supposing the mortality of the one hundred and eighty-three undetermined to have been the same as that of the determined cases, or about one-third, the death-rate of the aggregate ratio of mortality would, of course, be unchanged. If two-thirds of the undetermined cases proved fatal, the death-rate would be 36.3 per cent. Assuming that *all* the undetermined cases resulted fatally, the ratio of mortality of the aggregate of eight hundred and eighty-four cases would be 46.4 per cent.[1]

1. Amputations in the Upper Third of the Arm, of Uncertain Date.—Ninety-four amputations in the upper third of the arm, in which either the date of injury, or, more commonly, the date of operation, or, occasionally, both dates, were omitted in the reports, are included in this series. The operations were practised on twenty-three Union and seventy-one Confederate soldiers. In eighty-two cases, in which the results were ascertained, the mortality rate was 25.6 per cent.

[1] Observations on secondary amputations of the arm during the war, for the effects of shot injury, have been published: By Act'g Ass't Surgeon W. H. BUTLER (*Am. Med. Times*, 1863, Vol. VII, p. 159); by Surgeon A. B. MOTT, U. S. V. (*Am. Med. Monthly*, 1862, Vol. XVIII, p. 351); by Dr. J. ASHHURST, Jr. (*Am. Jour. Med. Sci.*, 1863, Vol. XLV, p. 344); by Surgeon J. BRYAN, U. S. V. (*Boston Med. and Surg. Jour.*, 1863, Vol. LXVII, p. 374, and *Am. Med. Times*, 1863, Vol. VII. p. 288); by Act'g Ass't Surgeon W. P. MOON (*Am. Jour. Med. Sci.*, 1868, Vol. LV, p. 58); by Ass't Surgeon J. W. PITTINOS, 67th Pennsylvania (*Am. Jour. Med. Sci.*, 1863, Vol. XLVI, p. 51); by Med. Cadet E. COUES, U. S. A. (*Med. and Surg. Reporter*, 1863, Vol. IX, p. 230, three cases); by Surgeon J. SHRADY, Jr. (*Am. Med. Times*, 1863, Vol. VI, p. 173).

§ *Successful Cases.*—Sixty-one amputations in the upper third, resulting successfully, were—on the right side in thirty-three, on the left in twenty-six, unspecified in two cases. The methods of operating are not recorded. Six of the patients returned to modified duty; the remainder were exchanged, paroled, or released. In two cases the limb was torn off by cannon shot; the other cases are simply described as gunshot fractures. There were no recorded antecedent or synchronous operations. In one instance, an enucleation of the head and remaining portions of the shaft of the humerus was secondarily practised.

TABLE XCI.

Condensed Summary of Sixty-one Successful Cases of Amputation in the Upper Third of the Humerus, of Uncertain Date.

No.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	*Akin, C. E.*, Pt., E., 12th Virginia, age 27.	Sept. 14, 1862.	Left. Retired March 15, 1865.
2	*Alley, W.*, C. S. A.	Aug. 15, 1864.	Right; October, 1865, excision of head of humerus.
3	*Anderson, L.*, Serg't, F, 10th Virginia, age 21.	———	Right. Discharged.
4	*Apple, F. J.*, Corp'l, A, 56th Virginia, age 25.	June 17, 1864.	Left. Retired.
5	*Ayres, T. B.*, Pt., C, 20th Alabama, age 38.	June 27, 1864.	Right. Discharged.
6	*Bowdon, —*, Pt., A, 53d Georgia, age 25.	May 5, 1864.	Right; by Surg. J. J. Knott, P. A. C. S.
7	*Carver, A. J.*, Corp'l, F, 45th Tennessee, age 23.	Aug. 31, 1864.	Left. Discharged.
8	*Case, T. D.*, Serg't, D, 30th N. C., age 32.	July 15, 1864.	Right. Discharged.
9	*Chapman, H.*, Pt., A, 48th North Carolina.	Sept. 17, 1862.	Left. Discharged.
10	*Chapman, J.*, Corp'l, F, 23d Georgia.	July 30, 1864.	Left. Discharged.
11	*Clay, S. M.*, Pt., F, 9th Virginia.	July, 1863.	Left. Paroled Sept. 25, 1863.
12	*Cullep, J. C.*, Pt., A, 30th Virginia, age 20.	Oct. 19, 1864.	Right. Discharged.
13	*Eldridge, J. F.*, Pt., C, 13th Mississippi.	1863.	Left. Retired Feb. 1, 1865.
14	*Garlick, C. W.*, Serg't, B, 4th Va., age 23.	July 3, 1863.	Left. To prison Jan. 15, 1864.
15	*Gear, R. M.*, Pt., F, 12th Georgia.	Sept. 19, 1864.	Left. To Provost Marshal Feb. 11, 1865.
16	Gillespie, J., Capt., E, 12th Wisconsin.	July 21, 1864.	Left; (also wound involving spine.) Discharged June 7, 1865.
17	*Grubb, A.*, Pt., A, 54th N. C., age 18.	Sept. 24, 1864.	Left. Discharged.
18	*Guest, J.*, Pt., F, 53d Georgia, age 21.	May 5, 1864.	Right; by Surg. J. J. Knott, P. A. C. S. Died 1867, cancer of penis.
19	*Guilliam, J. T.*, Pt., I, 4th Ky., age 28.	May 14, 1864.	Right. Discharged.
20	*Hardin, J.*, Corp'l, D, 15th Texas, age 25.	Sept. 1, 1864.	Right. Discharged.
21	*Harland, —*, Pt., A, 53d Georgia, age 18.	Sept. 17, 1862.	Left; by Surg. J. J. Knott, P. A. C. S.
22	*Harris, J. M.*, Capt., D, 3d S. C., age 30.	———	Right. To prison Aug. 10, 1863.
23	*Helms, J. T.*, Serg't, A, 24th Virginia, age 20.	May 16, 1864.	Right. Discharged.
24	*Johnson, J. L.*, Capt., B, 24th Georgia.	Aug. 16, 1864.	Left. Furloughed Sept. 22, '64.
25	*Jones, W. J.*, Pt., B, 40th Alabama, age 24.	June 4, 1863.	Left. Discharged.
26	*Lassiter, R. W.*, Pt., A, 63d Georgia, age 41.	July 22, 1864.	Left. Discharged.
27	*Law, G. W.*, Lieut. Col., 3d Missouri.	May, 1863.	Left. Discharged.
28	*Litaker, J. A.*, Serg't, K, 57th N. C., age 33.	Dec. 13.	Right. Discharged.
29	*Londenslager, T. D.*, Pt., Johnston's Battery.	May 30, 1864.	To Provost Marshal April 21, 1865.
30	*Lyon, J. L.*, Pt., H, 11th Mississippi, age 17.	July 3, 1863.	Left. Exchanged March 3, 1864.
31	*Minor, E. C.*, Serg't, F, 3d Va. Cav., age 20.	Sept. 22, 1864.	Right. Discharged.
32	*Norton, W. E.*, Pt., F, 13th Georgia, age 24.	———	Left. Discharged.
33	Nott, A. M., Pt., F, 25th Michigan.	———	Right. Discharged September 4, 1863.
34	*Owen, L.*, Pt., C., 6th Alabama, age 22.	May 12, 1864.	Left. Discharged.
35	*Palmer, E. L.*, Serg't, A, 9th Ala., age 22.	May 3, 1863.	Right. Discharged.
36	*Parker, J. H.*, Pt., D, 58th Virginia, age 28.	May 12, 1864.	Left. Discharged.
37	*Paxton, C. H.*, Lieut., A, 18th Virginia.	May 14, 1864.	Right. Furloughed June 2, 1864.
38	*Peck, W. H.*, Pt., A, 30th Virginia.	June 5, 1864.	Left. Discharged.
39	Philbriek, J., Pt., C, 2d Illinois Cavalry.	Aug. 16, 1862.	Right. Discharged Oct. 23, 1862; pensioned.
40	*Phillips, W. F.*, Pt., F, 37th Georgia, age 26.	June 19, 1864.	Right. Discharged.
41	*Pinkhard, R. G.*, Pt., B, 6th Missouri, age 25.	June 27, 1864.	Right. Retired March 4, 1865.
42	*Potillo, J. L.*, Serg t, D, 60th N. C., age 35.	Nov. 25, 1862.	Right; (also wound of lung.) Discharged.
43	*Salloway, R. C.*, Serg't, I, 1st South Carolina.	May 5, 1864.	Right. Discharged.
44	*Steel, W. J.*, Serg't, A, 63d Georgia, age 32.	June 27, 1864.	Left; (also wound of lung.) Discharged.
45	*Talbott, J. B.*, Pt., H, 4th Alabama, age 24.	Aug. 30, 1862.	Right. Furloughed October 4, 1862.
46	*Thompson, W. G.*, Pt., D, 32d Miss., age 21.	July 21, 1864.	Right. Discharged.
47	*Thomas, J. W.*, Corp'l, H, 43d N. C., age 23.	Aug. 25, 1864.	Right. Exchanged October 27, 1864.
48	*Tombs, W. F.*, Pt., E, 18th Miss., age 20.	July 2, 1863.	Left. To Provost Marshal October 6, 1863.
49	*Upshur, A. G.*, Pt., B, 13th Georgia, age 22.	Sept. 17, 1862.	Right. Discharged.
50	*Waggoner, F. M.*, Pt., A, 23d Tennessee, age 24.	June 22, 1864.	Right. Discharged.
51	*Warbington, A. J.*, Pt., C, 41st Miss., age 29.	Aug. 31, 1864.	Right. Discharged.
52	*Weaver, J. R.*, Pt., D, 13th Mississippi.	July 2, 1863.	Right. Retired Dec. 27, 1864.
53	*Whelchel, R. F.*, Pt., D, 28th Georgia, age 21.	Sept. 17, 1862.	Left. Discharged.
54	*Whittaker, W.*, Lieut., E, 37th North Carolina, age 27.	July —, 1863.	Right. To prison April 10, 1864.
55	*Williamson, W. H.*, Maj., 7th Tennessee.	July 1, 1863.	To prison September 23, 1863.
56	*Wilson, W. E.*, Pt., D, 2d Louisiana.	July 1, 1862.	Left. Retired Dec. 19, 1864.
57	*Williams, J. H.*, Pt., I, 25th North Carolina.	April 2, 1865.	Right. To prison May 15, 1865.
58	Wise, E. B., Serg't, F, 11th Pa. Reserves.	July 1, 1863.	Right. To Vet. Res. Corps Dec. 1, 1863.
59	*Woods, J. H.*, Serg't, C, 10th Ala., age 27.	May 6, 1864.	Right. Retired January 5, 1865.
60	*Yates, B. F.*, Pt., K, 20th North Carolina.	July 1, 1863.	Right. Retired January 27, 1865.
61	*Zachary, A. F.*, Capt., F, 61st Alabama.	May 12, 1864.	Left. Furloughed June 2, 1864.

§ *Fatal Cases.*—There were twenty-one amputations of the arm at the upper third, of undetermined date, that resulted fatally. There were nine on the left and nine on the right side, and in three cases this point was unnoticed. No antecedent operations were

recorded. The proximate causes of death were referred to in very few instances. In one case, the subclavian artery was consecutively ligated.

TABLE XCII.

Condensed Summary of Twenty-one Fatal Cases of Amputations at the Upper Third of the Humerus, of Uncertain Date.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	*Allston, T. B.*, Major, 1st South Carolina.	———	Right. Died June 19, 1864.	12	Kline, H., Serg't, A, 8th Michigan, age 32.	June 17, 1864.	Left. Died July 12, 1864, asthenia.
2	*Averitt, W. E.*, Pt., H, 14th Tennessee.	Aug. 9, 1862.	Hæmorrhage; ligat'n subclavian. Died June 26, 1863.	13	Marsh, J., Pt., I, 98th Ohio.	Oct. 8, 1862.	Left. Died November 12, 1862.
3	Bragg, A. C., Pt., 2d Ohio Battery.	———	Right. Died May 15, 1863, gangrene.	14	Moore, H., Pt., E, 4th Colored Troops.	Feb. 11, 1865.	Right. Died March 7, 1865.
4	Chase, N., Pt., I, 4th Maine.	July —, 1863.	Left. Died July 21, 1863.	15	Mott, G. D., Pt., D, 58th Pennsylvania, age 20.	July 4, 1864.	Left. Died August 9, 1864, gangrene.
5	Ewing, H., Pt., H, 140th Pennsylvania.	July —, 1863.	Left. Died July 23, 1863.	16	*Newman, T.*, Pt., B, 4th Alabama.	———	Left. Died September 29, 1862.
6	*Gailes, G. A.*, Pt., D, 55th Virginia, age 32.	April 2, 1865.	Right. Died May 29, 1865, exhaustion.	17	Richards, I., Pt., E, 82d Ohio.	July —, 1863.	(Also fracture of head.) Died July, 1863.
7	*Green, E. T.*, Pt., E, 14th Virginia.	July —, 1863.	Right. Died August 15, 1863.	18	Smith, J. B., Lieut., B, 53d Illinois.	July 11, 1863.	Right. Died April 11, 1864.
8	Harsh, J., Pt., I, 98th Ohio.	Oct. 8, 1862.	Died November 12, 1862.	19	Strachan, D., 1st Lieut., B, 63d Pennsylvania, age 23.	———	Left. Died June 6, 1864.
9	Hassmer, J., Corp'l, A, 37th Ohio.	May 16, 1862.	Left. Died June 8, 1862, erysipelas.	20	*Waldman, J. D.*, Pt., B, 16th Mississippi.	———	Right. Died June 3, 1863.
10	Jeffries, S. S., Pt., C, 54th Indiana.	Dec. 29, 1862.	Right. Died January 29, 1863.	21	Young, M. M., Capt., K, 17th Maine.	July —, 1863.	Left. Died August 13, 1863.
11	*Kirkley, D. M.*, Corp'l, G, 2d South Carolina.	Sept. 17, 1862.	Right. Died December 7, 1862. *Spec.* 1103.				

Undetermined Cases.—The final result of twelve operations could not be ascertained.

TABLE XCIII.

Condensed Summary of Twelve Cases of Amputations at the Upper Third of the Humerus, of Uncertain Date and Undetermined Result.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Bell, G. J., Saddler, M, 15th N. Y. Cavalry.	———	Left.	7	*Goodson, J. E.*, Serg't, A, 8th S. C.	July 29, 1864.	Right.
2	*Burrell, B.*, Pt., I, 3d South Carolina.	July 29, 1864.	Left.	8	*Green, W.*, Pt., H, 14th South Carolina.	July 28, 1864.	Left.
3	Civit, R. A., Private.	Dec. 13, 1862.	Right.	9	*Jordan, H. E.*, Corp'l, C, 21st Georgia.	Aug. 21, 1862.	Left.
4	*Finelley, R.*, Pt., E, 28th Georgia.	———	Left.	10	*Moorfield, H.*, Pt., G, 53d North Carolina.	Mar. —, 1865.	Right; (erysipelatous inflammation April 2.)
5	Fry, M., Private, B, 4th Ohio.	May 18, 1864.	Right.	11	Steinmaker, W., Serg't-Major, 7th Michigan.	July 3, 1863.	Left.
6	Gladden, J., ——, D, 6th Kansas Cavalry.	———	Left.	12	*Thompson, L. H.*, Serg't, H, 22d Georgia.	July —, 1863.	Left.

The reports of the ninety-four cases of amputations in the upper third, of uncertain date, were not accompanied by pathological specimens, except in a single instance.[1]

2. Amputations in the Middle Third of the Arm, of Uncertain Date.—In this group sixty-seven cases are recorded, of which forty-five were successful and thirteen fatal, while in nine instances the result is unknown. The operations were practised on fifteen Union and fifty-two Confederate soldiers. The amputations were on the left side in thirty-four, on the right in twenty-nine, not reported in four.

§ *Successful Cases.*—Of the forty-five patients who recovered, four returned to modified duty, four were discharged, twenty-nine were paroled or exchanged, and eight were furloughed from Confederate hospitals.

[1] Specimen 1103, from Case 11 of TABLE XCII, is "the stump of the right humerus, amputated two inches below the tuberosities. The extremity is necrosed; periosteal thickenings occupy the most of the shaft, but without positive reparation."

TABLE XCIV.

Condensed Summary of Forty-five Cases of Recovery after Amputations in the Middle Third of the Shaft of the Humerus, of Uncertain Date.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	*Abercrombie, J. T.*, Lt., E, 27th Georgia.	———	Right. Furloughed October 6, 1864.
2	*Albright, J.*, Pt., H, 10th Va. Cav., age 18.	April 3, 1865.	Right. Discharged June 23, '65.
3	*Allen, W. N.*, Q. M. Sg't, 43d Georgia, age 23.	May 28, 1863.	Right. Retired January 30, '65.
4	*Amy, T.*, Private, C, 8th Louisiana.	July, 1863.	Right; (also wound of thigh.) Retired May 9, 1864.
5	*Anderson, C. M.*, Pt., E, 6th N. C., age 23.	July 1, 1862.	Left. Discharged.
6	*Ball, S.*, Pt., H, 25th S. C., age 22.	———	Left. Paroled June 28, 1865.
7	*Benton, W. H.*, Pt., F, 1st Miss. Art., age 22.	April 9, 1865.	Left. Paroled May 16, 1865.
8	Bond, J., Pt., B, 52d Ohio.	———	Left. Discharged September 1, 1864.
9	*Bradley, D. F.*, Lieut., A, 2d Florida.	May 6, 1864.	Left. Furloughed July 7, 1864.
10	*Branch, A. H.*, Serg't, D, 6th Virginia.	———	Left. Retired October 25, 1864.
11	*Brown, W. W. L.*, Pt., E, 2d Louisiana.	Nov. 27, 1863.	Right. Discharged January 29, 1864.
12	*Byrd, R.*, Serg't, D, 25th North Carolina.	———	Left. Discharged September 20, 1862.
13	*Connally, J.*, Col., 55th North Carolina.	July 1, 1863.	Left; (also wound of ilium.) Exchanged March 3, 1864.
14	*Darden, J. M.*, Lieut., B, 13th Georgia.	May 12, 1864.	Right. Furloughed June 30, '64.
15	Diall, B., Pt., G, 9th Illinois.	———	Left. Discharged July 10, 1864.
16	*Dudley, R. S.*, Pt., C, 4th Virginia.	July, 1863.	Left. Paroled September 5, '63.
17	Dusenbury, J., Pt., D, 51st Ohio.	Dec. 31, 1862.	Right. Discharged March 23, 1863.
18	*Eubanks, F. M.*, Pt., H, 19th Georgia, age 23.	June 26, 1862.	Left. Discharged.
19	*Falls, J. O.*, Pt., D, 14th North Carolina.	July 3, 1863.	Right. Transferred October 6, 1863.
20	*Freeman, I.*, Pt., D, 12th South Carolina.	Aug. 16, 1864.	Right. To prison December 6, 1864.
21	Green, J., Pt., 6th Cavalry, age 30.	———	Left. Duty October 1, 1864.
22	*Hardy, J. P.*, Serg't, D, 13th Miss., age 22.	Nov. 30, 1864.	Left. Retired March 7, 1865.
23	Hels, D., Pt., A, 14th Kansas Cavalry.	———	Left. Discharged June 30, 1864.
24	Hunter, L., Pt., C, 105th Penn., age 18.	———	Right. Discharged December 2, 1863.
25	*James, R.*, Lieut., C, 51st North Carolina.	June 1, 1864.	Right. Furloughed June 11, '64.
26	*Lettice, M.*, Pt., B, 10th Georgia.	July 2, 1863.	Left. Retired December 31, '64.
27	*Lakenman, I. N.*, Pt., C, 3d North Carolina Artillery, age 36.	———	Right. Paroled June 28, 1865.
28	*Lyell, J. W.*, Lieut. Colonel, 47th Virginia.	Aug. 18, 1864.	Left. Furloughed August 29, 1864.
29	*Madden, P.*, Pt., E, 9th Louisiana.	May 25, 1862.	Right. Retired September 12, 1864.
30	*Marmon, J.*, Pt., G, 42d Mississippi.	July, 1863.	Right. Paroled November 12, 1863.
31	*McCarty, T.*, Serg't, F, 2d Virginia, age 25.	May 5, 1864.	Right. Discharged.
32	McGowan, E., Pt., K, 28th Mass.	Sept. 17, 1862.	Right. Discharged December 29, 1862; pensioned.
33	*Michel, H.*, Pt., B, 14th Louisiana.	May 5, 1862.	Left. Discharged October 27, 1863.
34	*Nash, T.*, Pt., B, 7th North Carolina.	———	Discharged October 25, 1862.
35	*Patterson, J. R.*, Lieut., K, 25th N. C.	July 30, 1864.	Left. Furloughed September 8, 1864.
36	*Simms, G.*, Pt., D, 61st Alabama, age 19.	July 12, 1864.	To prison September 24, 1864.
37	*Slaughter, H. J.*, Lieut., I, 61st Alabama.	July 18, 1864.	Left. Furloughed August 29, 1864.
38	Steuart, J., Pt., K, 183d Penn., age 45.	May 26, 1864.	Right; by A. A. Surg. G. H. Mitchell. Disch'd June 14, '65; pensioned.
39	*Tingin, J. R.*, Pt., H, 24th N. C., age 30.	Sept. 17, 1862.	Right. Discharged.
40	*Tucker, W. A.*, Pt., A, 23d N. C., age 26.	May 3, 1863.	Right. Retired February 21, '65.
41	*Tysor, T. P.*, Corp'l, I, 33d N. C., age 28.	July 11, 1864.	Left. To prison September 28, 1864.
42	*Walden, —*, Pt., F, 53d Georgia, age 30.	1863.	Left; by Surgeon J. J. Knott, P. A. C. S.
43	*Watson, C. R.*, Pt., A, 18th Virginia, age 25.	Mar. 31, 1865.	Left. Discharged June 20, 1865.
44	*West, J.*, Pt., A, 59th Virginia, age 42.	June 2, 1864.	Left. Discharged.
45	*Woodall, F. J.*, Pt., H, 18th Georgia, age 30.	Aug. 30, 1862.	Left. Furloughed October 4, '62.

§ *Fatal Cases.*—In thirteen fatal amputations in the middle third of the arm, in which the interval between the injury and operation was not recorded, the details are very scanty. One patient succumbed to secondary hæmorrhage, and two died from diarrhœa or dysentery. The causes of death in the remaining cases are not reported.

TABLE XCV.

Condensed Summary of Thirteen Cases of Unsuccessful Amputations in the Middle Third of the Shaft of the Humerus, of Uncertain Date.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.
1	Adams, J., Serg't, C, 2d Missouri.	Sept. 19, 1863.	Right. Died Oct. 17, 1863.
2	*Bond, H. C.*, Pt., B, 28th Virginia, age 32.	Mar. 31, 1865.	Right. Died July 9, 1865, dysentery.
3	*Coble, A.*, Pt., E, 3d N. Carolina Art., age 25.	———	Right. Died Feb. 16, 1865.
4	*Evans, J. H.*, Serg't, A, 55d Georgia, age 32.	1864.	Left. Died June 23, 1864, secondary hæmorrhage.
5	Gurnsey, G. H., Pt., E, 17th Conn., age 33.	———	Right. Died Aug 9, 1862.
6	*Hatfield, G. W.*, Pt., E, P. S. S.	———	(Also flesh wound of thorax.) Died July 21, 1862.
7	*Johnson, D. F.*, Pt., F, 3d N. C. Art., age 41.	———	Right. Died Feb. 28, 1865.
8	*Legett, J.*, Pt., D, 12th Alabama.	Mar., '65.	Right. Died.
9	Lester, W., Pt., F, 69th Indiana.	———	Right. Died June 5, 1863, chronic diarrhœa.
10	McGinnis, H., Pt., E, 27th Ohio, age 29.	July 22, 1864.	Right. Died Nov. 17, 1864.
11	Parker, W. M., Pt., C, 28th Illinois.	April 6 or 7, 1862.	Died May 2, 1862.
12	Scaright, G. W. B., Pt., D, 18th Infantry.	———	Left. Died Oct. 13, 1863.
13	Sterns, G. W., Pt., G, 24th New York Cav., age 27.	June 17, 1864.	Left. Died July 23, 1864.

The death-rate as computed from the fifty-eight determined cases of this series of amputations at the middle third is, therefore, 22.4 per cent. The nine undetermined cases of this group are tabulated below.

§ *Undetermined Cases.*—In nine cases of amputation at the middle third neither the period of operation nor result were recorded. All the facts that are known are recited in the table.

TABLE XCVI.

Condensed Summary of Nine Cases of Amputations in the Middle Third of the Shaft of the Humerus, of Uncertain Date and Uncertain Result.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	*Fry, J. P.*, Pt., B, 42d N. C., age 28.	Sept. 1, 1864.	Left; by Surg. Kimble.	6	*Melton, B. W.*, Pt., H, 11th Georgia.	Aug. 16, 1864.	Left.
2	*Gilbert, W. T.*, Pt., I, 18th S. C.	Nov. 5, 1864.	Left.	7	*Myers, G. E.*, Lieut. Col., 10th Mississippi.	Aug. 31, 1864.	Left.
3	*Harris, W. B.*, H, 2d Mississippi, age 30.	July 12, 1862.	Left.	8	*Partain, J. M.*, Pt., D, Phillips' Ga. Legion.	May 6, 1864.	Right.
4	*Jennings, R. H.*, Lieut., G, 3d S. C.	July 28, 1864.	Left.	9	*Thrift, W. D.*, Pt., B, 40th Virginia, age 38.	Aug. 18, 1864.	Right.
5	*Lynn, T. H.*, Pt., F, 5th South Carolina.	Oct. 29, 1863.	Left.				

3. Amputations in the Lower Third of the Arm, of Uncertain Date.—Twenty-four amputations of the arm belong to this group, the interval between the injury and operation being unknown. Twenty-two patients recovered; in two cases the result is not reported. The operations were practised on five Union and nineteen Confederate soldiers,—on the left side in twelve, on the right in nine, not reported in three. Four patients returned to modified duty, four were paroled, and fourteen discharged; in two cases the result remained undetermined. The cases appear to have been uncomplicated by other injuries or operations. There were no fatal examples in this group,[1] and the successful and undetermined cases will be included in one tabular statement.

TABLE XCVII.

Condensed Summary of Twenty-four Cases of Amputations in the Lower Third of the Shaft of the Humerus, of Uncertain Date.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.
1	*Autney, W. J.*, Lieut., A, 14th Alabama.	———	Discharged October 17, 1862.	13	*Jennings, J. C.*, Pt., C, 24th Va., age 29.	May 16, 1864.	Right. Discharged.
2	*Check, R. F.*, Pt., G, 12th Georgia, age 18.	Mar. 31, 1865.	Left. Released June 29, 1865.	14	*King, A. A.*, Lieut., A, 3d S. C. Battery.	———	Right. To prison December 5, 1863.
3	*Dudley, J.*, Pt., B, 7th Texas, age 21.	July 22, 1864.	Left; (wound of jaw.) Duty January 30, 1865.	15	*Mathews, D.*, Pt., C, 1st N. C. Art., age 20.	———	Paroled June 28, 1865.
4	*Elliott, B. S.*, Lieut., F, 53d Georgia, age 26.	———	Right. To prison September 3, 1863.	16	*McIver, D. R. W.*, Serg't, 21st N. C., age 33.	———	Left. To Provost Marshal May 31, 1865.
5	*Gamble, J. M.*, Serg't, B, 6th Alabama.	———	Right. Discharged June 23, 1863.	17	O'Connor, P., Pt., K, 31st New York.	———	Right. Discharged August 25, 1863.
6	*Gillion, J.*, Pt., A, 10th Louisiana.	July 2, 1863.	Left. Duty March 15, 1864.	18	*Patterson, J. F.*, Pt., G, 40th Georgia.	Sept. 19, 1864.	Right. Retired Feb. 27, 1865.
7	Graves, W., Pt., M, 4th Col'd Art., age 20.	Mar. 2, 1865.	Left. Discharged February 26, 1866.	19	*Randolph, J. B.*, Pt., C, 26th Miss., age 38.	Feb. 28, 1864.	Right. Discharged.
8	*Gutierrdy, J.*, Pt., F, 10th Louisiana.	May 18, 1862.	Left. Discharged September 22, 1863.	20	*Ravpey, S. D.*, Pt., F, 2d S. C., age 18.	Oct. 19, 1864.	Left. To Provost Marshal Feb. 11, 1865.
9	*Hackett, J.*, Pt., D, 29th Alabama, age 25.	———	Left; gangrenous. Discharged.	21	*Savage, S.*, Pt., A, 38th N. C., age 27.	April 2, 1865.	Left. Discharged July 9, 1865.
10	Higgins, A. T., Pt., K, 99th Pa., age 19.	April 6, 1865.	Left. Disch'd August 15, 1865.	22	Sexton, G. W., Pt., D, 140th Pennsylvania.	May 3, 1863.	Right. Discharged August 28, 1863.
11	*Holloway, W. L.*, Pt., A, 13th Virginia.	———	Left. Retired December 8, 1864.	23	*May, L. J.*, Pt., E, 12th Georgia.	July 9, 1864.	Left.
12	Horner, N., Pt., B, 2d Colored Troops.	———	Right; by A. A. Surg. N. J. Pettijohn. Dis'd Nov. 5, '63. *Spec.* 1675.	24	*Tipton, J. J.*, Confederate prisoner.	———	By Surg. T. J. Bluthardt, 23d Missouri.

[1] That is, reported as fatal. Of CASE 12, TABLE XCVII, which furnished specimen 1675, no trace can be found at the Pension Office. The specimen represents a shot comminution of the bones of the right forearm, probably from a primary or early intermediary amputation at the junction of the lower and middle thirds of the humerus.

4. Amputations in the Continuity of the Arm, of Uncertain Date, without Indication of the Seat of Incision.—There were six hundred and ninety-nine amputations in the upper arm, in which not only the interval between the injury and operation, but the precise seat of operation, were unrecorded. In about a fourth of these cases the result as to fatality was also unknown. The determined cases give a death-rate of 35.9 per cent. The operations were practised on two hundred and twenty-five Union and four hundred and seventy-four Confederate soldiers.

§ *Successful Cases.*—Three hundred and forty-five amputations in the continuity of the upper arm, in which the precise point of incision and the date of operation are alike undetermined, resulted successfully. Twenty-eight of the patients returned to modified duty, one hundred and twenty were exchanged or paroled, and one hundred and ninety-seven were discharged. The operations were practised on the right side in one hundred and eleven, on the left in one hundred and fifty-eight, not recorded in seventy-six. Eleven patients received wounds in some other region than the arm. In one case there was a synchronous amputation of the leg. One patient survived an ulterior disarticulation at the shoulder.

TABLE XCVIII.

Condensed Summary of Three Hundred and Forty-Five Cases of Recovery after Amputations in the Arm, of Uncertain Date, without Indication of the Seat of Incision.

No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.	No.	Name, Age, and Military Description.	Dates.	Operations, Operator, Result.

345	*Zeigler, L.*, Corp'l, H, 58th Virginia.	July 20, 1864.	Right. Discharged.

§ *Fatal Cases.*—One hundred and ninety-four amputations of the arm of uncertain seat and date resulted fatally. Of these, seventy operations were on the right, fifty-eight on the left side, not recorded, sixty-six. The causes of death are recorded in a small proportion of the cases.[1] One patient had undergone previously an excision of the elbow; one submitted to a synchronous amputation of the thigh; one succumbed after a subsequent exarticulation at the shoulder.

TABLE XCIX.

Condensed Summary of One Hundred and Ninety-Four Fatal Cases of Amputations in the Arm, of Uncertain Date and Seat.

NO.	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.	NO	NAME, AGE, AND MILITARY DESCRIPTION.	DATES.	OPERATIONS, OPERATOR, RESULT.

RECAPITULATION.—Fifty-four hundred and fifty-six cases of amputations of the upper arm in the continuity, on account of shot injury, have been enumerated in the thirty-three preceding tabular statements. In TABLE LXVII, on page 697, the reader will find these cases numerically classified, according to the date, seat, and results of the operations, the figures having been verified by careful scrutiny of the individual cases, as proven by the concise alphabetical record devoted to each group. A series of analogous facts of such unusual magnitude will commend itself to the statistical student; yet some readers may not care to analyze the numerical array, preferring a digest of the conclusions it presents.

The results of the amputations were ascertained in fifty-two hundred and seven-three cases, and present a mean fatality of 23.6 per cent. The proportion in which the group of one hundred and eighty-three undetermined cases detracts from the precision of the conclusions is less than three per cent. Assuming that *all* the undecided cases terminated fatally, the ratio of mortality of the aggregate of fifty-four hundred and fifty-six cases would be 26.1 per cent., or, on the more probable supposition that not more than one-half or two-thirds of them were fatal, the death-rates would be respectively 24.5 or 25.1 per cent. When we come to compare these results with those of the same operation in other wars, it will be apparent that the variable quantity introduced by the group of undetermined cases is comparatively insignificant.

The date of operation was learned in forty-five hundred and seventy-two cases, with results as to fatality determined in all. There were thirty-two hundred and fifty-nine primary operations, practised within forty-eight hours from the date of the injury, with six hundred and two deaths, or 18.4 per cent. Nine hundred and two intermediary amputations, practised from the third to the thirtieth day inclusive, present three hundred and two deaths, or 33.4 per cent. Four hundred and eleven secondary amputations, practised subsequent to the thirtieth day, were followed by one hundred and fourteen deaths, or 27.7 per cent.

The seat of operation, or rather the point of section in the arm, was reported in forty-four hundred and forty-nine cases. In the upper third, nineteen hundred and fifty-two amputations—primary, intermediary, secondary, and of undetermined date—had a mortality rate of 18.+ per cent.[1] In the middle third, seventeen hundred and thirty-nine amputations

[1] Of the 1,952 amputations at the upper third, 358 are known to have terminated fatally, and the results of 12 cases are undetermined. If the latter are reckoned fatal, the death-rate will be 18.9 per cent. If the mortality rate is computed from the determined cases only, it is 18.4 per cent.

of the four groups present a death-rate of rather more than 16 per cent.[1] In the lower third, seven hundred and fifty-eight amputations had a death-rate of 26.+ per cent.[2] The excessive proportion of fatal results in the amputations at the lower third, already adverted to on page 739, will be hereafter discussed. Of the series of fifty-four hundred and fifty-six amputations in the continuity, the right limb was involved in twenty-five hundred and nineteen, and the left in twenty-six hundred and thirty-two; hence it is highly probable that the left extremity was most frequently interested, although the three hundred and five cases, in which this point could not be ascertained, forbid exact conclusions on the subject. Nothing, however, invalidates the remarkable fact that the determined operations on the left side, while the most numerous, had a less proportionate fatality than those on the right. This accords with the conclusion established on page 610, in regard to excisions at the shoulder, in which, it will be recollected, the operation on the left side furnished a slightly larger proportion of favorable results.[3]

The influence of age on the result of amputations of the arm for injury may be inferred from the issue of about three-fifths of the cases in which the ages were recorded, as shown in the following Table, which exhibits the mortality rate of four hundred and twelve patients under twenty years of age, as 18.4 per cent.; of eleven hundred and sixty-eight patients of twenty to twenty-four years, inclusive, as 19.6 per cent.; of six hundred and eighty-two patients of twenty-five to twenty-nine years, inclusive, at 23.8 per cent.; of three hundred and sixty patients of thirty to thirty-four years, at 21.4 per cent.; of two hundred and thirteen patients of thirty-five to thirty-nine years, at 27.3 per cent.; of two hundred and thirty-three patients over forty years, at 24.9 per cent.

Table CI.

Statement of the Ages of Three Thousand and Sixty-eight Patients who submitted to Amputation of the Arm for Shot Injury.

[1] Of the 1,739 amputations at the middle third, 284 were fatal and 9 undetermined cases; the death-rate varies from 16.4 to 16.8 per cent., according as the undetermined cases are estimated.

[2] The 758 amputations at the lower third present 197 fatal cases and 2 undetermined, leaving a margin of variation from 26.06 to 26.2 per cent. of fatality.

[3] Of the 1,246 determined fatal amputations in the arm, 584 belonged to the series of 2,519 amputations on the right side, and 506 to the series of 2,632 amputations on the left side, while 156 cases could not be referred. Thus the more numerous amputations on the left side were less fatal in the proportion of about 4 per cent.

The tables furnish some data toward estimating the influence of season and of climate on the results of injuries and operations; but it will be well to reserve deductions on these subjects until analyses can be made from larger aggregates. It may be observed, in passing, that little difference is exhibited in this series, in the mortality in the amputations practised among troops campaigning in the Eastern or Atlantic region, and those in the Western armies, serving in the "Middle region" of the Medical Returns.[1]

The five thousand four hundred and fifty-six amputations were practised on five thousand four hundred and forty-eight patients, the discrepancies in numbers being due to the cases of double amputation, as will be more fully explained hereafter. Of the five thousand four hundred and forty-eight patients, four thousand four hundred and eighty-one were Union and nine hundred and sixty-seven Confederate soldiers. The latter escaped with a rather smaller mortality rate than the former, the determined cases giving a fatality of 21.9 per cent., instead of the 23.6 death-rate of the aggregate.

CONCLUDING OBSERVATIONS ON SHOT INJURIES OF THE UPPER ARM.— Notwithstanding the extent of space they occupy, I have thought it expedient to introduce a large number of instances and illustrations of shot fractures of the shaft of the humerus and of the lesions consequent thereon, and to put on record all the individual cases, without exception, of amputations in the continuity of the bone, whether practised for direct injury of its diaphysis, or for lesions implicating the elbow or distal portions of the limb. A numerical statement of the amputations might have been accepted as accurate; but the record of the details of each case not only permits their classification and comparison as to the influence on the results of age, of length of service, of season and climate, of the mode of operating, of the complications, and of other conditions; but also furnishes facilities to those who would sum up and put together these facts from new points of view, or subject the printed record to a more exhaustive analysis, or study particular cases from the manuscript files; besides affording opportunity for the recognition and correction of erroneous or duplicated entries. By collating the data in this Section with the observations on flesh wounds in the first part of the Chapter, and with many of the cases of excision and amputation at the shoulder in the third Section, the reader has access to a body of statistical facts on shot injuries of the upper arm of extraordinary extent. While, however, the exposition of details has been so extended, little has been said of those features of the subject less amenable to statistical arrangement, and it remains to make some remarks of a more general nature on the treatment and progress of such cases of injury when managed by expectation, excision, or amputation.

It will be remembered that, on page 666, the results of nearly three thousand shot fractures of the shaft of the humerus treated on the expectant conservative plan were found highly consolatory, so far as loss of life was concerned, hardly a seventh of the patients having succumbed. But there was excluded from this aggregate a large number of cases treated conservatively at the outset, but ultimately subject to intermediary or secondary excisions or amputations, with a high rate of mortality. Were these facts added, it is probable that the expectant method would exhibit a greater fatality than primary amputations. Yet such is the inestimable value of the upper extremity to the patient's comfort and welfare, that surgeons will never hesitate to incur a very considerable hazard to life, and the certainty of protracted inconvenience and suffering, provided there be a favorable

[1] In 5,039 cases the localities at which the operations were practised are known. 3,455 patients belonged to Eastern armies, of whom 802 died, or 23.2 per cent. 1,584 belonged to Western armies, and of these patients 372 died, or 23.4 per cent., a trivial difference.

prospect of ultimately preserving a useful hand. Accordingly, ever since primary amputations began to be practised methodically and with comparative safety—that is, since the latter part of the seventeenth century—there have not been wanting distinguished advocates of conservative measures in very severe shot comminutions of the shaft of the humerus,[1] and teachers of military surgery have limited more and more the conditions under which amputation may be warrantable, until, in our day, accepted authorities teach, with Guthrie, that, "an upper extremity should not be amputated for almost any accident that can happen to it from musket shot," or, with M. Legouest, that shot comminution of the humerus, even attended by laceration of the brachial artery, does not render amputation

[1] JOSEPH DU CHESNE (1544–1609), a physician of Henry IV, and best known as a chemist and follower of PARACELSUS, and, under his pseudonym of Quercetanus, was one of the earliest writers to advocate conservative measures in dealing with shot fractures of the arm. In his *Sclopetarius, sive de curandis vulneribus, quae sclopetarum et similium tormentorum ictibus accidunt*, Lyon, 1576, he deprecates the readiness of surgeons in such cases "to cut off, to put asunder, as I may say to play the butcher," and declares that a just appreciation of the injury forbiddeth that it [the wound] be hid and rowled so fast, as is used in simple fractures, in that it requireth to be dressed oft, that the filth and extrementes whiche nature expelleth may have issue, and, for that cause, some use straightwayes *sctones* (as they thearme them) if it may easily be put in the wound * * * and some use only tentes, and if need require, they also amplifie and inlarge the orifice thereof, and likewise the lower parts, whereby all filth and baggage may issue out the better." (*The Sclopetarie of* JOSEPHUS QUERCETANUS, or his Booke containing *the cure of wounds received by Shot or Gunne or such like Engines of Warre*, Published into English by JOHN HESTER, London, 1590, p. 57.) BELLOSTE (*Le Chirurgien de Hôpital*, 1696, et 3ème éd., 1716, Chapt. xxii, p. 183, and English ed., 1706, Chap. xxi, p. 146), a very prudent surgeon, and a devoted disciple of MAGATUS, in the excellent little work in which he narrates his experience in the Italian campaigns of his time, details a case of badly comminuted shot fracture of the upper part of the left humerus, treated so successfully, on the expectant plan, that the patient, "the grenadier *Bellehumeur* of the Navarre regiment, wounded in 1693, and treated in hospital at Brianzon, returned to the ranks in forty days." He also narrates (*op. cit.*, 3ème éd., p. 199) the case of M. de la Roque, Colonel of the Montferrat regiment, whose humerus was shivered by a ball at Mondevis. He was treated by BELLOSTE, at Turin, on a strictly expectant plan, being allowed to go about with his arm in a sling. His convalescence was but once interrupted, when a consultation of surgeons decided to inject the sinuses with stimulating lotions, and afterward to stuff them with lint. This excited great inflammation; but, expectant measures being resumed, the case again progressed favorably, and resulted in an excellent recovery. The famous HENRY FRANÇOIS LE DRAN, although he introduced into surgery the operation of exarticulation at the shoulder, was averse to resorting lightly to this or other amputations. Throughout his *Traité sur les Playes d'armes à feu* his strong leaning toward conservative measures is manifested. In his *Observations de Chirurgie*, 1731, T. I, p. 332, he devotes a chapter to the case of M. de Therade, whose left humerus was shattered between the insertions of the great pectoral and the deltoid, by a musket ball, at the siege of Gironne, in 1710, and condemns the tents, and incisions, and tractions on adherent fragments, and other meddlesome practises just instituted, and relates how rapidly the case progressed toward recovery, when simple dressings and a sling were substituted, by his direction. RAVATON, whose works on military surgery abound in carefully detailed cases, relates no less than five successful examples of shot comminutions of the humerus treated on the expectant plan. In his *Chirurgie d'Armée*, 1768, p. 274, etc., he mentions first the case of a soldier of the Guiso regiment, wounded during Marshal Broglie's retreat from Bavaria, the shaft of the right humerus being shattered by a ball. Exarticulation at the shoulder was proposed, but RAVATON'S advice prevailed, and the patient recovered under conservative measures, with a shortened arm, and was sent to the springs of Bourbonne. Secondly, Webert, of the Marck regiment, was wounded February 11, 1757, his left humerus being shattered. RAVATON introduced his finger, and found so much comminution, that he was inclined to amputate, but, as the patient was but 22 years old and of vigorous constitution, he concluded to remove nine large and many small fragments by slightly enlarging the wound, and then laid the arm on a concave tin splint padded with felt, supported on a pillow, and had the satisfaction on the sixty-ninth day of good union of the bone and motions of the arm, though with considerable shortening. Vavincour, marine, 22 years old, had his right arm fractured by a cannon ball, on the frigate Formidable, November 20, 1759. He was treated on the conservative plan, and RAVATON met him two years subsequently, with good use of his arm and ability to write, play the violin, etc. Fourth, Lebourié, a sailor, 20 years old, had his arm fractured at the same battle by grapeshot, the forearm and metacarpus being also shattered. He left hospital eleven months afterwards, cured. Lastly, Vaché, a sailor, aged 22 years, had the lower part of the right humerus shattered, by a cannon ball in the same action, on the Formidable, and recovered in four months, after numerous exfoliations. RAVATON adds that he knows of a "prodigious number" of facts testifying to the extent to which wounds with great loss of substance may favorably unite in young subjects. PIERRE JOSEPH BOUCHER, in the first part of his celebrated dissertation, *Sur des Playes d'Armes à feu, compliquées de fracture, aux articulations des extrémités, ou au voisinage de ces articulations* (in *Mém. de l'Acad. de Chir.*, 1753, T. II, pp. 292 and 301), relates two cases of successful conservative treatment of shot comminutions of the humerus: A case in which one of the King's bodyguard had the lower portion of the shaft of the humerus shattered, and recovery ensued without amputation, at the hospital of St. Sauveur; and the case of a soldier wounded at Ramilies, the upper portion of the shaft of the humerus being shattered by a ball. The chief surgeon of the army declared that the limb must come off; but, by the advice of M. POLLET, an assistant of the famous J. L. PETIT, the limb was preserved, and the patient made a good recovery at the hospital at Lisle. As might be expected, examples of successful conservative treatment of shot comminutions of the humerus are accumulated in the writings of the fanatical opponent of amputation, J. U. BILGUER. In his *Chirurgische Wahrnehmungen*, Berlin, 1763, Sn 466–482, he details nine cases of shot fractures of the shaft of the humerus treated by extraction of loose fragments and retentive apparatus, all resulting favorably (Cases 35, 36, 60, 64, 69, 71, 92, 101, 108). Surgeon Major BOURIENNE relates (ROUX'S *Jour de Méd. Chir. et Phar.*, Paris, 1774, p. 170) a very interesting case of shot fracture of the upper portion of the shaft of the right humerus in the person of J. May, wounded May 15, 1765, a Corsican soldier, 26 years old, who made a good recovery, although the bone was shivered into many fragments. BOURIENNE observes that although such an extent of injury usually decides the need to amputate, such a success proves "que c'est toujours une tentative louable que de travailler à la conservation des membres," and argues that amputations should be avoided in similar cases, although: "on a vu, dans ce siecle, le plus grands praticiens d' une opinion contraire sur cette matiere." H. ST. JOHN NEALE, in his *Chirurgical Institutes drawn from Practice in Gunshot Wounds*, 2d ed., London, 1805, p. 230, relates the case of Captain Van Nagel, of the Donop Hessian regiment, wounded at the storming of the Redbank fort, on the Delaware, near Philadelphia, October 23, 1777. A grapeshot entered the biceps five inches above the elbow, and running obliquely upward shattered the bone and emerged through the triceps. The orifices of the wound were "very largely dilated," and the patient was copiously bled by Surgeon STIEGLITZ. After taking four and a half pounds of Peruvian bark, this officer recovered with a shattered but useful arm, in thirteen weeks, exfoliations weighing one ounce and two drachms having been eliminated. The distinguished J. L. SCHMUCKER (*Vermischte Chir. Schriften*, Berlin, 1872, B. III, S. 84) cites the case of a boy, aged 11 years, shot on June 9, 1777, through the arm. The shot was fired at a distance of less than six paces, and the gun was loaded with bird shot and a small ball; five inches of bone were carried away, and the soft parts were terribly lacerated. The boy recovered, with free use of the arm and fingers. CHEVALIER (T.) (*A Treatise on Gunshot Wounds*, 1864, p. 114) relates the case of G. W——, with shot splintering of the right os brachii, October 2, 1799, with recovery after extraction of a loose portion of the bone. In five months the wound was perfectly healed. "The arm was two inches shorter than the other; but he retained the use of the shoulder joint, limited only by the state of the muscles and the rigidity remaining after so much inflammation." LARREY gives many examples of the conservative treatment of shot fractures of the shaft of the humerus in his *Mémoires et Campagnes* and in the *Clinique Chirurgicale*, and, from his time forward, in place of general allusions, such instances are frequently detailed.

"indispensable." In the class of injuries under consideration, Professor Pirogoff[1] repeats, in effect, the famous declaration of Velpeau: "the older I grow the less I amputate." Professor Esmarch relates how conservative measures were resorted to in constantly increasing proportion in each of the successive Schleswig-Holstein campaigns. Drs. Matthew[2] and Williamson state that the British surgeons in the Crimea and India had recourse to primary amputation of the arm only under "the most desperate circumstances."[3] Drs. Schwartz, Lohmeyer, and Rupprecht, and Professors Sédillot and Legouest bear equally emphatic testimony regarding the principles and practice of contemporary French and German military surgeons, on this point.[4] Drs. Gherini and Demme inform us that similar

[1] PIROGOFF (N.) (*Grundzüge der Allgemeinen Kriegs-Chirurgie*, 1864, S. 777), speaking of shot fractures of the diaphyses of the humerus, observes: "The large majority of them are susceptible of a conservative treatment." And elsewhere: "The amputation in the humerus figured in a very subordinate rôle with us in the Crimea." Nevertheless, he adds: "Yet I believe that we were too free with this operation, as a primary amputation in the middle third of the humerus for shot fractures. That operation I would like to banish entirely from the practice of war surgery, and would say that only in comminuted, and very complicated fractures of the forearm, might amputation in the lower third of the humerus still be considered as indicated."

[2] Staff Surgeon T. P. MATTHEW, the historian of the surgery of the British Army in the Crimea (*Med. and Surg. History of the British Army which served in Turkey and the Crimea during the War against Russia*, 1858, Vol. II, p. 359), after remarking that "complete compound gunshot fractures of the long bones were the accidents by which amputation was, in the great majority of cases, necessitated," and that the percentage of recoveries in shot fractures of the humerus, without resort to amputation, either primary or consecutive, was 26.6, continues as follows: "With regard to the humerus, unless *very extensive longitudinal splintering of the bone* had taken place, or there had been very large destruction of soft parts, *no amount of comminution appeared to warrant amputation*. In many instances, the comminuted portions were cleared away and the jagged ends smoothed by the saw or cutting pliers; as much as three inches in length of the entire thickness of the shaft of the bone has been thus taken away, and the patient recovered with a useful arm. Some of the patients, indeed, where smaller portions only had been removed, were able to return to duty. Thus, three private soldiers and a sergeant of the 97th Regiment each received a compound fracture of the humerus on the 8th of September, at the assault on the Redan (three of which were said to have been received in the body of the work); three were from musket bullets which had perforated the arm, and one from a grapeshot, which had been removed through the wound. In all, some fragments of bone were taken away. The last-named returned to his duty, well, on the 25th of November, and the three former were sent to England in January, as there was little prospect of their services being required in the Crimea, all nearly fit to resume duty, and only requiring time." Dr. G. H. B. MACLEOD says (*Notes on the Surgery of the War in the Crimea*, 1858, p. 304): "The injury, indeed, would need to be very extensive before we would think of performing amputation at an early period in gunshot wounds of the arm; as, *unless the vessels are destroyed*, there are many most dreadful and hopeless-looking accidents from which the arm will recover; and, besides, secondary amputations are so successful and resections so often sufficient to fulfil the necessary indications, that *primary amputation is never performed in the upper extremity except under the most desperate circumstances*."

[3] In recording the condition of the invalided British soldiers who returned from the Mutiny in India of 1858, Staff Surgeon G. WILLIAMSON, M. D. (*Military Surgery*, 1863, pp. xxv, 127, 222), after remarking that: "In compound fractures of the upper extremities primary amputation is never resorted to except in very severe and hopeless cases of gunshot wounds," relates some particulars of twenty-three invalids after shot fracture of the humerus. These comprised one case of ununited fracture at the middle third, two of anchylosis of the shoulder, and several complicated by exfoliations and abscesses. Six returned to modified duty. Dr. WILLIAMSON is of opinion that shot fractures of the humerus "are generally of such a severe character as ultimately to incapacitate the patient for the duties of a soldier." * * "Great muscular contraction and rigidity of the tendons and ligaments is usually the result," and if the fracture is near the head or condyles, the neighboring joint is very liable to become anchylosed. Dr. C. A. GORDON (*Experiences of an Army Surgeon in India*, 1872, p. 27) details the treatment of two of the cases mentioned by Dr. WILLIAMSON—two officers, who recovered after shot comminution of the shaft of the humerus, with loss of power and sensation. In his *Lessons on Hygiene and Surgery from the Franco-Prussian War*, London, 1873, p. 143, Dr. GORDON reverts to this subject.

[4] Thus, ESMARCH (F.) (*Ueber Resectionen nach Schusswunden*, Kiel, 1851, S. 26), treating of the war in Schleswig-Holstein, narrates: "Bei sehr beträchtlichen Zerschmetterungen," u. s. w., or, as Mr. STATHAM translates: "In very considerable comminution of the shaft of the humerus, amputation was not infrequently performed in the two first campaigns. In 9 cases, preservation was attempted by removal of the splinters and resection of the ends of the fragments: 4 of these patients died, and of the remaining 5 many retained very defective limbs. In 7 similar cases in 1849, consolidation was essayed, without resection, by immediate removal of the loosened splinters in 3 cases, and, after the occurrence of suppuration, in the 4 others. The result was beyond expectation, as but 1 of the three first proved fatal, and in the last 4 the recovery was complete and comparatively rapid. In 1850, therefore, in such cases, we followed the same (last-mentioned) practice, and with surprising consequences. Of 25 cases, but 4 died; in the remainder a complete cure followed, although in many the humerus had been shattered by canister shot. In all these cases the fractures fully consolidated, and, in many, the usefulness of the arm was almost entirely restored." SCHWARTZ (*Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, S. 212), writing of the same campaigns, declares that: "In clean transverse fractures [of the humerus] primary amputation is always to be rejected, even where the brachial artery has been injured; it is only when the vessels and nerves are simultaneously lacerated that amputation remains the sole alternative. * * In cases of slight splintering in the upper, middle, or lower thirds, primary amputation is not to be performed. * * All cases of extensive splintering in the upper or lower thirds should be primarily amputated, or, for the former injury, exarticulated; but, in cases of comminuted fracture of the *middle* third, primary amputation should be rarely practised. We have seen cases of this kind recover, and recover exceedingly well. * * Resection in the continuity of the humerus is to be rejected." LOHMEYER (C. F.) (*Die Schusswunden und ihre Behandlung*, Göttingen, 1859, S. 187) observes: "Even cases of crushing of the diaphysis of the humerus, as a rule, result favorably without operative interference, even when they are very extensive," and details a case in which sixty pieces of bone were removed and the patient recovered with shortening of about two inches. RUPPRECHT (L.) (*Militärärztliche Erfahrungen*, 1871, S. 65) is another advocate of expectant conservative measures. He tabulates 134 cases of shot fractures of the humerus, from Massy, Langensalza, etc., of which 42 proved fatal; eighty were amputated with 29 deaths, and 54 were treated expectantly with 13 deaths. He concludes that: "In the aggregate, about one-third of the cases of this sort of injury proved fatal." He subsequently discriminates by the remark: "Of those operated upon, one-third died as a rule, while of those treated on the conservative expectant plan, one-fourth, at the most, perished." M. SÉDILLOT (*Du traitement des fractures des membres par armes de guerre*, in *Arch. gén. de méd.*, 1871, VI sér., T. 17, Vol. 1, p. 400) remarks of shot fractures of the arm: "La conservation doit être le but principal du chirurgien, et nos observations prouvent qu'elle peut être fréquemment suivie de succès. Nous y avons eu recours sur des malades auxquels l'amputation avait été conseillée, et nous avons eu la satisfaction de sauver des membres, qui allaient être sacrifiés. Sans doute, l'amputation réussit plus sûrement et plus promptement; mais les usages de la main sont d'une si grande utilité qu'on peut abandonner quelques chances de vie devant l'avantage de les conserver, dans tous les cas où les pertes de substance ne sont pas trop considérables et où les nerfs et les vaisseaux n'ont pas été totalement divisés." M. LEGOUEST (*Chirurgien d'armée*, 2ème éd., 1872, p. 529) remarks, on amputation of the arm for shot injury: "Lorsque les vaisseaux et les nerfs sont intacts, l'amputation n'est indiquée que si les parties molles sont compromises dans une grande étendue, ou si l'humérus est fracturé avec éclats ou esquilles considérables, dont l'extraction doit entraîner une perte de substance dans la continuité de l'os qui ne permettrait pas d'espérer la consolidation des fragments."

views prevail among the Italian medical officers.[1] The Confederate surgeons who have published their views on the subject, generally advocated conservatism in dealing with shot fractures of the humerus, except in most aggravated cases. The compilers of the Confederate Surgical Manual embody their recommendations on this point in the words of Professor Longmore.[2] Dr. Warren and Dr. Chisolm, in their treatises on military surgery,[3] advise attempts to save the limb, even when fracture of the humerus is complicated by division of the brachial artery. Indeed, among recent writers of any authority, Mr. Cole, who served with the auxiliary forces of the British Army in the Punjaub in 1848–49, and Dr. Appia, of Geneva, are almost solitary advocates of primary amputations for ordinary comminutions of the shaft of the humerus by musket balls.[4] It is true, however, that the teachings of many of the authorities admit a great latitude of interpretation, and, while commending an expectant conservative policy, recognize exceptions that may be readily more numerous than cases conforming to the rule. Many authors adopt the phraseology of Dupuytren and sanction an expectant conservative treatment except in "very extensive comminutions."[5] Now, in a large proportion of fractures of the shaft of the humerus by musket ball, the bone is shattered to an extent that would be reckoned a *very extensive comminution* if it had occurred in civil practice or was produced by any other form of violence,[6] and it is certain that, at all events in the earlier periods of the late civil war, such splintering of the bone, uncomplicated by lesions of the blood-vessels or nerves, or extended lacerations of the soft parts, or implication of the articulations, was very frequently regarded as a sufficient cause for primary amputation. After deducting from the thirty-two hundred and fifty-nine cases of primary amputations all those that were practised for lacerations of the upper arm, elbow, or forearm, by cannon shot, and all attended by injury to the vessels and nerves, or by unusual destruction of the soft parts, there still

[1] GHERINI (A.), *Vade Mecum per le Ferite d'Arma da Fuoco*, Milano, 1866, p. 132; and DEMME (H.), *Mil.-Chir. Studien*, Würzburg, 1861, B. II. S. 227, who states that: "The Italian War of 1859 has again confirmed the experience, that even extensive comminuted fractures of the shaft of the humerus do not in themselves demand amputation. But it is a fact not to be denied that, notwithstanding this experience, many amputations and exarticulations performed in the Italian hospitals might have been left undone."

[2] *A Manual of Military Surgery, prepared for the Use of the Confederate States Army*, by order of the SURGEON-GENERAL, Richmond, 1863, p. 65. It is understood that Drs. A. TALLEY, St. GEORGE PEACHY, A. E. PETICOLAS, J. DUNN, and H. F. CAMPBELL were the compilers of this manual. The passage quoted from Professor LONGMORE'S well-known dissertation on *Gunshot Wounds* is as follows: "Unless the bone be extremely injured by a massive projectile, or longitudinal comminution exist to a great extent, especially if also involving a joint, or the state of the patient's health be very unfavorable, *attempts should always be made to preserve the upper extremity after a gunshot wound*," which is the language used by Deputy Inspector-General T. LONGMORE in his dissertation on *Gunshot Wounds*, in HOLMES'S *System of Surgery*, London, 1861, Vol. II, p. 75.

[3] WARREN (E.), *An Epitome of Mil. Surgery*, 1863, p. 372, and CHISOLM (J. J.), *A Manual of Military Surgery*, 1863, p. 386.

[4] COLE (J. J.) (*Military Surgery, or Experience of Field Practice in India during the Years* 1848–49 [War in the Punjaub], 1852, p. 154) observes, of gunshot wounds of the upper arm: "In a very large proportion of cases, *loss of limb is the inevitable consequence when the humerus is broken by a musket bullet*. In every instance now before us [in the Punjaub], the bones were comminuted—smashed, and although the soft parts were little torn, the arteries and nerves untouched, still in all it was absolutely necessary to amputate. If you do not cut off the arm, long-continued suppuration will cut off the patient." APPIA (P. L.) (*The Ambulance Surgeon, or Practical Observations on Gunshot Wounds*, English translation, edited by Messrs. NUNN and EDWARDS, Edinburgh, 1862, p. 163): "Fracture of the humerus at its middle is always a serious wound, and one which calls for amputation whenever the splinters are very numerous and the laceration of the skin very extensive." Dr G. H. B. MACLEOD (*Notes on the Surgery of the War in the Crimea*, London, 1858, p. 304) asserts that PIROGOFF "was so displeased with the results of his attempts to cure fractures of the upper extremity in the Caucasus, that he was disposed to submit them all to amputation." This statement is not consistent with the passage from Professor PIROGOFF'S *Grundzüge, u. s. w.*, quoted on the preceding page, and I find no warrant for it in the *Reminiscenzen aus dem Kriege im Kaukasus* of the celebrated Russian surgeon.

[5] DUPUYTREN left the question of amputation for shot fractures of the shaft of the humerus to be determined by the extent of comminution: "The shattering of the bones of limbs by a ball," he says (*Leçons Orales de clin. chir.*, 2ème éd., 1839, T. V, p. 300), "is one of the most frequent conditions requiring amputation, even when this is the sole complication. When a ball has broken the principal bone of a limb into splinters, it is very difficult to determine in what cases amputation should be practised. Here the foresight of the skilled surgeon is often at a loss. If the disorders are mediocre; if the splinters are not too numerous, of which it is easy to be assured by the finger after enlarging the ball track; if the soft parts are not too much damaged, an attempt may be made to save the limb, after making suitable incisions to prevent inflammation from constriction, and to extract splinters, etc. The patient is placed in a complicated fracture apparatus, and dressed once or twice daily, according to the abundance of the suppuration; the strictest cleanliness is observed, and the patient is often cured, principally in those cases in which the upper extremity is involved and the patient is endowed with a good constitution." In very young subjects, DUPUYTREN thinks it justifiable to trust to expectant measures in shot fractures of great severity.

[6] The specimens represented in FIGURES 512, 514, 515, 518, 519, 520, 523, although by no means selected for the purpose of showing the extent of longitudinal fissuring produced by musket balls, were all examples of shot comminutions for which primary amputations were practised, and very fairly illustrate the ordinary amount of splintering observed in such accidents. In the very numerous specimens of comminutions of the diaphysis of the humerus by musket balls, preserved in the Army Medical Museum, in which the missile has struck the compact tissue of the middle region of the shaft, the bone is usually found with from two to five large fragments, and a half dozen, or often many more, small fragments, and the fissures seldom extend for less than three or four inches, and often interest six or eight inches of the shaft.

remains a very large group, in which the limb was sacrificed solely because of the extensive comminution of the shaft. Such operations were sometimes criticised as unnecessary;[1] but it is consolatory to reflect that they were probably attended with the saving of life at least, since they were usually practised under conditions which precluded the adoption of suitable conservative measures in the absence of hospital facilities or of easy transportation. The surgeons, doubtless, sometimes yielded to what John Bell called "an argument of necessity as well as of choice, and limbs that in happier circumstances might have been preserved, had often, in a flying army or a dangerous campaign, to be cut off;" since "it is less dreadful to be dragged along with a neat amputated stump, than with a swollen and fractured limb, where the arteries are in constant danger from the splintered bones."

When it was determined that a shot fracture of the humerus should be treated on the expectant plan, after foreign bodies had been removed, the limb was commonly put up in splints. There was great variety in the primary dressings. Many, perhaps the majority of surgeons, were averse to the use of complex apparatus,[2] and dreaded the effects of constricting bandages. Some employed the modes of dressing recommended by Medical Inspector Hamilton, U. S. A., an accepted authority on the treatment of fractures.[3] Others, after

[1] Surgeon C. H. RAWSON, writing in regard to the wounded from the battle of Wilson's Creek (*Am. Med. Times*, 1862, Vol. IV, p. 11), says: "I was shown several cases of compound comminuted fracture of the leg and arm, in all of which the bones had united and some healed up permanently, but with every prospect of final recovery, * * considering the number of cases, the serious character of the injuries, and the results in all that I saw, I can but come to one conclusion, that very many limbs are removed that might be saved."

[2] HENNEN (J.) (*Principles of Military Surgery*, 3d ed., 1829, p. 117) teaches that: "In compound fractures of the humerus and forearm, complex machinery is not called for. With ordinary splints and a leather sling, furnished with a strap to go round the neck and support the limb, we are able to manage extremely well. When fever, or some other untoward circumstance, does not forbid it, I always encourage patients with these injuries to keep out of bed as much as possible; the weight of the forearm assists considerably in keeping fractures of the humerus in a proper state of coaptation, while the flexing at the elbow often prevents sinuses from running down under the integuments and among the muscles of the forearm, which sometimes occurs when the patient lies long in the horizontal position, and especially if the forearm is *spread out in a line with the humerus*, as I have more than once seen. * * Once in the day, at least, a compound fracture should be *regularly* and formally dressed. On these occasions, all depositions of matter should be carefully pressed out (?), splinters felt for and removed, and clean strips of bandage applied in lieu of those soiled or destroyed by the suppuration. To prevent the soaking of the bedding, a piece of coarse cloth or oiled silk should be placed permanently under the whole limb, and occasionally renewed; and, to obviate the ill effects of the matter stagnating in the wound, the lightest scraped lint should be laid on it. In some cases I have effectually obviated this stagnation, when the position of the wound did not favor the flow of matter, by placing a soft sponge over the limb, which absorbed the pus as soon as it was formed, and by drawing a woolen thread through it, and connecting it with a proper dish below, it has performed the part of a syphon. During the employment of these surgical means the bowels should be kept in a natural state by saline laxatives."

[3] HAMILTON (F. H.) (*A Treatise on Military Surgery*, 1865, p. 392) describes his dressing for shot fracture of the shaft of the humerus as follows: "If the shaft is involved in the fracture at any point above the base of the condyles, the fragments will require some support. It would be well, indeed, if splints could be applied firmly, as in simple fractures, but such is not usually the fact: and the truth is, that in general too much has been attempted; the bandages have been applied too tightly and perseveringly, and sometimes at the sacrifice of the limb. We employ usually, in these cases, a single splint, made of felt, leather, or gutta-percha, long enough to extend over the top of the shoulder on the one hand, and to the lower part of the elbow joint on the other, and broad enough to encircle one-third of the circumference of the arm; by moulding or otherwise fitting the upper part of the splint over the top of the shoulder, it will be prevented from being displaced downward (FIG. 565). Before being applied, the concave surface should be padded with cotton or tow, and covered with a piece of cotton cloth stitched along the back of the splint. This splint should be secured in place by a few light turns of a roller, and never applied so tightly as to endanger congestion of the limb below, or to render necessary the application of a roller to the hand and forearm. If this cannot be borne, or if it is found inconvenient from the position and size of the wounds, the limb must be simply laid upon a properly shaped and sufficiently firm pillow, the application of splints being reserved to a later day." In his instructive *Practical Treatise on Fractures and Dislocations*, 3d ed., 1866, p. 231, Professor HAMILTON gives substantially the same directions for the dressing of fractures of the upper portion of the humerus, adding that a "sling may then be applied as recommended by Sir ASTLEY COOPER, or the arm may be permitted to hang perpendicularly beside the body." After rejecting the axillary pad and clavicular bandage of COOPER as complicated and likely to expose the brachial plexus to painful if not injurious pressure, Professor HAMILTON comments favorably on the "very complete shoulder and arm splint of WELCH (FIG. 565, No. 1) as a substitute for the felt or gutta-percha splints he prefers, cites the pertinent observations of MALGAIGNE (*Traité des Fractures*, etc., 1847, T. 1, p. 531) and W. J. WALKER (*Essay on the Treatment of Compound and Complicated Fractures*, Boston, 1845), refers to the crutch splint of Mr. LONSDALE (*A Pract. Treatise on Fractures*, 1838, p. 174) and leather splint of Mr. ERICHSEN as contrivances likely to prove occasionally useful, and refers to his own memoir in the *Buffalo Medical Jour.*, 1851, in proof of the advantages of extension in the straight position in some cases of delayed union of oblique fractures of the humerus. In another work, Professor HAMILTON (*Principles and Practice of Surgery*, 1872, p. 273) regards fractures of the shaft of the humerus near the elbow joint as much more difficult of management than higher up. We take the liberty of citing his description and illustration (FIG. 566) of the mode of dressing such fractures: "The forearm should be placed at a right angle with the humerus and maintained in this position by a right-angled splint. After a thorough trial of angular splints made of movable joints, of wood, pasteboard, and various other kinds of apparatus, I am convinced that a thick piece of gutta-percha, moulded to the back and side of the arm, elbow, and forearm, will give the most satisfaction. When it can be obtained, an angular splint of hard felt, previously moulded upon a model, will answer nearly as well. Sole leather, if used, must be cut at right angles and applied to each side of the limb, since it cannot be made to double smoothly over the elbow upon its posterior aspect when bent at a right angle; but splints applied to the sides of the limb are not managed so easily as when applied to the back; and they are particularly inconvenient when laid upon the front, where most of the swelling usually takes place."

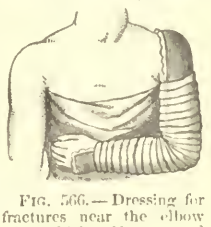

FIG. 566.—Dressing for fractures near the elbow joint. [After HAMILTON.]

the usual primary care of the wound by the removal of foreign bodies, the suppression of hæmorrhage, etc., steadied the upper arm by short splints of pasteboard, and put the forearm in a sling. Not a few bandaged the extremity from the fingers to the shoulder, and attempted to secure immobility of the injured limb by the application of one of the forms of external and internal angular splints which were supplied with most of the regimental hospital chests (FIG. 567). The ill effects of such constriction of the arm after shot comminutions and operations for excisions of the humerus were severely criticised by the medical inspectors.[2] Several plans were devised for extension and counter-extension in shot comminutions of the humerus. Dr. Vedder proposed two splints with this object,[3] and Surgeon F. Swift suggested a dressing that could be improvised for the same purpose.[4] The New England plan,[5] of using adhesive plaster for securing the extending loops, was regarded with much favor. The ingenious method practised by Dr. G. C. Harlan for maintaining immobility

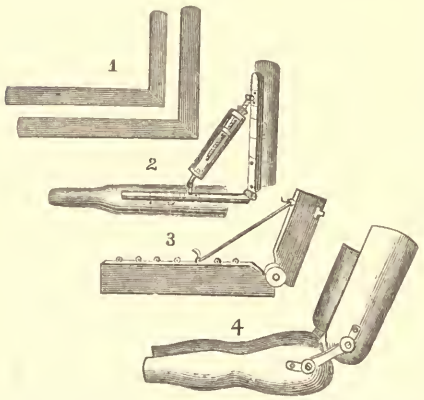

FIG. 567.—No. 1. Physick's splint; No. 2. Rose's splint; No. 3. Kirkbride's splint; No. 4, Welch's splint.[1]

[1] The drawing represents PHYSICK'S angular splint for the arm as usually figured. As described by DORSEY (*Elements of Surgery*, 1818, Vol. I, p. 139), the arms are united at a much more obtuse angle. Dr. KIRKBRIDE'S splint was originally proposed for compound fractures of the elbow, and figured in the *American Journal of the Medical Sciences*, 1835, Vol. XVI, p. 315.

[2] HAMILTON (F. H.) (*A Treatise on Military Surgery and Hygiene*, New York, 1865, p. 504) remarks: "At Fredericksburg, in May last, while the battles of the 'Wilderness' were in progress, we saw several of these exsections of the head of the humerus which had been made upon the field, to most of which were applied long arm-splints, and sometimes right-angled splints extending along the forearm as well as arm, and secured in position by rollers. These dressings were all loose, saturated with pus, and generally covered with maggots; while at the same time they were of no possible use."

[3] Dr. JOSEPH H. VEDDER, of Flushing, Long Island, has published (*Am. Med. Times*, 1862, Vol. IV, p. 254) a *New Apparatus for the Treatment of Fractures of the Long Bones*. He proposes to make extension and counter-extension in fractures of the arm either by an external lateral splint (FIG. 568), which is secured at the shoulder by an axillary padded strap, and to the lower part of the arm by adhesive strips, or else by an internal splint (FIG. 569) with an axillary crutch for counter-extension, both provided with circular turns of adhesive plaster to prevent lateral displacement. The extension is made in each case by attaching a cord connected with the loops of extending adhesive strips to a somewhat complicated "extension ratchet pulley" (FIG. 570), which is described in detail in a preceding number of the same medical journal (*Am. Med. Times*, 1862, Vol. IV, p. 24). Moved by a key, it regulates the degree of extension with as much precision as is permitted by the conditions under which counter-extension is made. The pulley is of brass, an inch in diameter, and a fourth of an inch in thickness, its circumference ratcheted at one edge and supplied with a groove at the other. A cat-gut cord, which is attached to the extension loop of adhesive plaster, is wound around the groove and tightened by means of an ordinary clock-key applied to the square head of the pivot (FIG. 570). A catch and spring fix the pulley in any desired position. The forearm is supported by a sling. This ingenious contrivance appears to have been very little used.

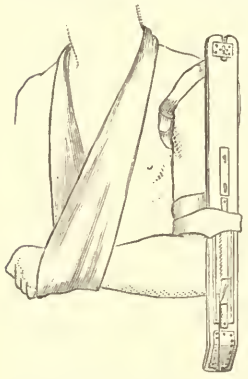

FIG. 568.—Bracket extension splint. [After VEDDER.]

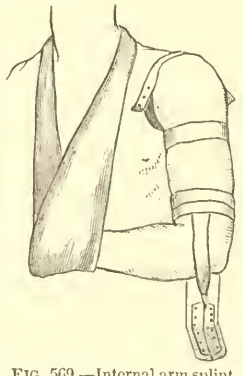

FIG. 569.—Internal arm splint. [After VEDDER.]

[4] Surgeon FOSTER SWIFT, 8th New York Militia, has described (*Am. Med. Times*, 1862, Vol IV, p. 253) an extemporaneous field splint for fractures of the humerus: "After the battle of Bull Run, on the 21st July, 1861, we were left with four or five cases of fractured arms, with no appliances for their treatment, and with the prospect of their transportation over a rough road in rough wagons to Manassas, and from thence to Richmond. Without splints and without any light material to make them of, I am indebted to Dr. HOGES, of one of the Mississippi regiments in the rebel army, for the following simple contrivance, which afforded great relief to our wounded men in their jolting journey. Two strips of adhesive plaster were cut two feet in length and three inches in width, one of which was carried over the upper fragment to the point of fracture, leaving a loop above; the other was carried in a similar manner over the lower fragment, forming a loop below. A piece of board about one foot longer than the fractured limb, with a V-shaped piece removed from each end, was then applied to the arm. The lower loop was tied by a bandage to the lower V, and the upper loop to the upper V. The fragments were thus separated, and the limb could be secured to the splint by a simple turn of the bandage above and below the point of fracture, thus leaving the orifice of the entrance and exit of the ball open." * * "When the surgeon is unable to provide himself with boards, he may extemporize a retentive splint from tree branches, by binding together two of suitable length and size so that a fork will be left (FIG. 571) on either end, over which the bandage attached to the loops may be tied. An axillary strap and the necessary pads must be made of such material as may be at hand." A similar expedient has been suggested by Professor ESMARCH, in a print on his half-handkerchief for ready battle-field dressings.

FIG. 570.—Extension pulley. [After VEDDER.]

FIG. 571.—Arm splint of branches. [After F. SWIFT.]

[5] Originally proposed by Dr. JOSIAH CROSBY, of Manchester, New Hampshire, in 1849, for the treatment of fractures of the leg (*New Mode of Extension in Fractures*, in *Am. Jour. Med. Sci.*, 1854, Vol. XXVII, p. 76), and said to have been first mentioned in print in MUSSEY'S report on Surgery, in the third volume of the *Transactions of the American Medical Association*, 1850. Priority for this important surgical improvement has been claimed for Dr. WALLACE, of Philadelphia (J. H. BRINTON, in note to Am. ed. of ERICHSEN'S *Surgery*), for Professor GROSS (F. W. SARGENT, in note to MILLER'S *Surgery*), and for Dr. SWIFT, of Easton (*North American Med. Chir. Rev.*, Vol. IV, p. 784).

after shot fractures of the upper part of the humerus or after excisions of that portion of the bone has been already noticed.[1] Dr. Swinburne has recommended a method for extension in fractures of the humerus by means of adhesive strips,[5] connected either with an external splint extending above the shoulder, or an internal splint with an axillary crutch. Dr. Clark has advised, in fractures near the head, extension by means of a weight[2] (FIG. 572). Many surgeons agreed with Professor Stromeyer,[3] that immobility was best secured in these fractures by securing the arm to the thorax, interposing a triangular cushion, as figured and described on page 517. This admirable appliance permits the arm to be kept at rest without materially interfering with the circulation and evoking the fatal facility for gangrene observed in these cases. Dr. Stromeyer assured Dr. MacCormac that he considered this arm-cushion "the most valuable appliance he had invented during his life." Where hospital facilities were immediately available, the injured arm was sometimes simply laid upon a pillow without splints or bandages, and treated by irrigation[4] or the application of ice-bags; but the surgeons were generally restricted to water dressings and evaporating lotions, means for

FIG. 572.—Extension method for fractures high up of the humerus. [After CLARKE.]

[1] Dr. HARLAN'S two forms of apparatus are described on page 509 *ante*, FIG. 388, and on page 562, FIG. 431. His apparatus was roughly made at the field forge of the 11th Pennsylvania Cavalry. An apparatus, on the same principle, for fractures of the radius, permitting the variable adjustment of the bracket, was devised by the late HENRY S. HEWIT, and a handsome model is deposited in the Army Medical Museum, and numbered 6359 in the Surgical Series. Surgeon-General BARNES has remarked that this dressing of shot comminutions of the upper part of the humerus, which he examined at the hospitals at Suffolk, Virginia, answered the indications more perfectly than any of the great variety of appliances he had occasion to observe during his extended tour of inspection as Acting Medical Inspector General.

[2] CLARK (E. A.) (*Method of Treating Fractures of the Humerus*, in *A Report on the Progress of Surg.*, St. Louis, 1871, p. 77): "The appliance consists merely of two strips of adhesive plaster about three inches in width, applied to the internal and external surface of the arm as high as the upper part of the middle third of the humerus. These strips are bound to the arm by a roller bandage, and at their lower end, beneath the point of the elbow, are attached to a cord, to which a sand-bag is attached weighing, ordinarily, from three to four pounds."

[3] STROMEYER (L.) (*Erfahrungen über Schusswunden im Jahre*, 1866, Hannover, 1867, S. 47) remarks: "For shot fractures of the dyaphysis of the humerus, there is only one suitable mode of bandaging, in which the thorax forms the splint; but that a uniform bed be formed, a pillow must be inserted between the arm and the thorax." * * * Any splint affixed to the humerus itself is always dangerous in the first weeks, and it cannot be firmly adjusted without circular pressure, and impedes the discharge of secretion." In his *Maximen* (1855, S. 696), the same great teacher says of fractures of the shaft of the humerus: "These shot fractures, in their treatment, require more perseverance on the part of the wounded than art on the part of the surgeon," and cautions against treating the fractured arm in an extended position on a splint, remarking that "every motion of the body displaces the upper fragment, while the lower remains on the splint, favoring the production of a false joint."

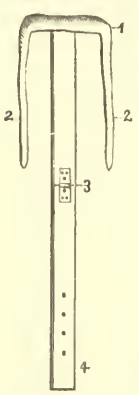

FIG. 573.–Crutch arm splint.

[4] WARREN (E.) (*Epitome of Pract. Surg. for Field and Hospital*, Richmond, 1863, p. 373) advises, in compound shot fractures of the shaft of the humerus, that: "The patient should be put to bed and the injured limb supported on a pillow, the forearm being kept at an obtuse angle with the arm, the elbow on a level with the shoulder, and the hand a little higher than the elbow. No bandage should be applied, but support may be given, either by wire splints, permitting irrigation, or two lateral wooden splints. The patient must be kept perfectly quiet, so that the upper fragment may not be disturbed by any movement of the trunk. When the swelling has subsided and the inflammation has been subdued, the starch bandage may be used with advantage."

[5] Dr. JOHN SWINBURNE (*Treatment of Fractures of Long Bones by Simple Extension*, Albany, 1861, p. 33) proposes to treat all fractures of the shaft of the humerus by extension and counter-extension. He describes his method as consisting in the use of a thin lath or board (FIG. 573) surmounted by a crutch piece, which supports a heavily padded axillary belt (1) secured by tapes (2 2). For convenience in packing, the splint may be folded by the hinge (3). At its lower end some holes are bored (4). The crutch is fitted accurately into the axilla (FIG. 574) and the tapes (3) are carried around and fastened over the shoulder (7). "This crutch apparatus extends from the axilla along the inside of the humerus to about six or eight inches below the elbow. Strips of adhesive plaster (2) are placed longitudinally about the lower end of the humerus so as to form a loop, through which is passed a cord, and thence through a hole in the lower end of the instrument (1) six or eight inches below the elbow; by tightening this cord, extension is made to the normal length of the bone, when it will be seen (FIG. 574) that the arm appears as natural as its fellow. All that now remains is to surround the arm and splint with an occasional strip of adhesive plaster to steady the limb at the seat of fracture. The object of connecting the elbow to the apparatus at so great a distance, is that the angle of extension shall not be too obtuse, otherwise it would draw against the splint." Dr. SWINBURNE sometimes places the splint externally and lets it extend above the shoulder (FIG. 575), so as to make counter-extension more in the axis of the limb. "The splint does not go below the elbow, but is fastened to it by adhesive plaster (2) after full extension is made." The axillary belt is passed through holes in the splint (4). Strips of adhesive plaster (2 2) are placed circularly at intervals "to prevent any kind of lateral motion in the parts." The arm thus dressed is kept in a sling (FIG. 576). "These forms of apparatus," the author says, "have succeeded most admirably, and are well adapted to the treatment of fractures occurring in any portion of the humerus, from the surgical neck down to within two inches of the elbow joint."

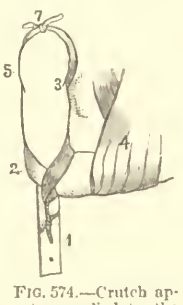

FIG. 574.—Crutch apparatus applied to the right arm. [After SWINBURN.]

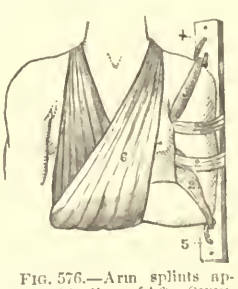

FIG. 576.—Arm splints applied with sling. [After SWINBURNE.]

the persistent and methodical application of cold being rarely available in the field.[1] Ice was plentifully supplied to the hospital department; but was consumed in iced drinks rather than in iced lotions.[2] Although recommended in the medical periodicals of the time,[3] plaster of Paris or gypsum bandages, latterly most favorably appreciated by many European military surgeons,[4] were rarely or never, during the war, employed by the American surgeons as a primary dressing in shot fractures of the humerus or other long bones. The use of starch and dextrine and plaster dressings in fractures had not been encouraged by surgical teachers in this country, and plaster was not issued with the hospital supplies. The removal of all detached splinters of bone was almost universally regarded as an essential preliminary to attempts at conservative treatment, although there was some difference of opinion as to propriety of disturbing large fragments that remained partially adherent. This subject is discussed by Assistant Surgeon Billings, U. S. A., in a report in the *Appendix to the First Part* of this work, with conclusions adverse to interference with

[1] The great advantage of the continuous application of cold after comminuted fractures is generally conceded. Unhappily, the opportunity of availing of this important adjuvant is rarely presented on the battle-field. STROMEYER (L.) (*Über die bei Schusswunden vorkommenden Knochen-Verletzungen*, Freiburg, i, B. 1850, S. 16, and STATHAM'S translation, London, 1856, p. 10) says: "Cold applications are next in importance to abstraction of blood as an antiphlogistic means. Unfortunately, in the campaign of 1849, we had no ice at our disposal; but in Freiburg, in 1848, at the time of the revolution, I had opportunity to assure myself of the great value of its application. In this form cold can be applied in the gentlest and least annoying manner. In the absence of ice, the application of cold water must sometimes take its place without nearly equalling it in value." ESMARCH (F.) (*Über Resectionen nach Schusswunden*, 1851, S. 20, and STATHAM'S translation, London, 1856, p. 52) observes: "In very many cases, however, the serous infiltration subsides by the mere application of cold, that is to say, when ice is procurable. In the year 1850, after the battle of Idstedt, we had in Schleswig plenty of ice at our disposal, so as to be able to employ it in all cases of comminution of bone, and indeed we found the most excellent results from it." In the Franco-German war, FISCHER (H.) (*Kriegschirurgische Erfahrungen*, 1872, S. 35) remarks: "Of ice we seldom made use, as we either had none or were only scantily supplied. * * The wounds were generally syringed with a solution of lime water, generally used cold. It hardly needs special mention, that wounds were cleansed by irrigation only, and that sponges were entirely banished."

[2] Ice was bountifully furnished to the general and post hospitals; but it was often impossible to have it accessible at the field station. The returns of the Chief Medical Purveyor show that nearly fifty thousand tons of ice (48,861 tons) were issued during the war by the purveying department, "in addition to vast quantities purchased from the hospital funds by the general and regimental hospitals throughout the country." The purveyors issued to hospitals at the rate of a pound daily to each patient. To this supply was added an occasional sloop or schooner load of ice sent to the hospitals by benevolent societies, and widely noticed in the newspapers. The utility of ice dressings in shot fractures of the long bones and in periarticular wounds has been strenuously insisted on by BAUDENS (*Des plaies d'armes à feu, Comm. à l'Acad. de Méd.*, 1849, p. 212), who remarks: "Je ne connais rien de plus énergique et de plus souverain que la méthode des réfrigérants et de la glace, avec ou sans addition de sel marin, selon qu'il convient d'obtenir un degré plus ou moins prononcé de froid." Dr. H. FISCHER, from experience in the Silesian, or Six Weeks War, also advocates topical applications of ice (*Lehrbuch der allgemeinen Kriegschirurgie*, Erlangen, 1868, S. 350): "The most energetic form of the application of cold is that of ice. It is best applied in bags of vulcanized caoutchouc, as hog bladders are never water-tight and rot readily. Caoutchouc, as a poor conductor of heat, admits of a longer application of cold. * * But it is necessary to place the ice-bag over a compress, and not immediately over the injured part. The ice was therefore extensively used in the late campaigns, and benefited the patients exceedingly in the first days,—pains diminished, sleep and better spirits supervened, * * but it has its disadvantages, * * and in times of war it is frequently difficult to supply ice in sufficient quantities. The present excellent means of transportation and the co-operation of all civilized nations for the relief of the wounded, facilitates the supply of ice. During the Bohemian War (1866), at a time when our supplies had dwindled down, large quantities of ice were sent us from North America. * * It is difficult to preserve ice in actual warfare. MIDDLEDORPF recommends to raise a shady place in an open field about a foot, and dig a ditch around it. The ice is then to be placed upon thick layers of leaves, straw, or moss, and to be thickly covered with the same. For the transportation of small quantities, MIDDLEDORPF had ice-boxes lined with zinc, made small enough to be placed on any farmer's wagon." There are, however, military surgeons of great experience who do not rate highly the utility of ice applications. It is true that they do not state how far they have made trial of them. M. LEGOUEST (*Traité de Chir. d'armée*, Paris, 1872, p. 177, etc.) does not think favorably either of topical applications of ice or by irrigation, and Dr. NEUDÖRFER (*Handbuch der Kriegschirurgie*, Leipzig, 1872) asserts that such treatment will cause tetanus, neuralgia, and rheumatic affections!

[3] Dr. ISIDOR GLÜCK, "Chief Surgeon to the Hungarian Hussars," published in the *American Medical Monthly*, 1855, p. 449, in a course of military surgery, a lecture on *Conservative Treatment of Fractures*, in which he described in detail the application of gypsum bandages in shot comminutions of the humerus, and insisted on their utility as a battle-field dressing. This lecture was reprinted in the *American Medical Times*, 1862, Vol. IV, p. 295, but the valuable suggestions it inculcates apparently attracted little attention. Professor F. H. HAMILTON states (*A Pract. Treatise on Fractures, etc.*, 3d ed., 1866, p. 89): "For the use of the surgeons in the U. S. Army, the Sanitary Commission furnished the plaster in tin cans hermetically sealed, but at a period too late to enable us to give it a fair trial in field practice. It is my impression, however, that this material is not well suited to the service of campaigns in this country, and that the opinions of foreign army surgeons as to its value must be taken with some allowance." After many inquiries, I cannot learn that any of these hermetically sealed cans of plaster found their way to the army surgeons.

[4] LOSSEN (H.) (*Kriegschirurgische Erf.*, u. s. w., *Deutsche Zeitschr. für Chirurgie*, 1873, B. II, S. 54) remarks, of the treatment of shot fractures of the shaft of the humerus, that: "with a few exceptions the gypsum bandage was given the preference over all bandages," and gives the drawing of a splint, to which, if necessary, an extension apparatus can readily be supplied. He continues: "VOLKMANN'S wire suspension splint for the upper extremity, after the pattern of SMITH'S suspension splint, often did excellent service. It was used as well to suspend fractures encased in gypsum bandages, as also to keep at rest fractures of the humerus already consolidated but yet suppurating freely. For treating the wound exposed, this simple splint, readily prepared out of telegraph wire, was very useful." BILLROTH (Th.) (*Chir. Briefe*, u. s. w., 1872, S. 223) admits that he has seen the gypsum bandage excellently applied by Dr. LOSSEN, but adds: "I have never succeeded very well in applying the gypsum bandage firmly to the shoulder, that the patient was not greatly inconvenienced." NEUDÖRFER (J.) (*Handbuch*, u. s. w., 1872, B. II, S. 1178) writes: "Regarding the gypsum bandage, I will only say this much: For the purpose of transportation no bandage can compete with the gypsum bandage, a fact that need not be dwelt on; but also for the treatment of those who remain in the hospitals, the application of the gypsum bandages is very beneficial, since they possess, as already mentioned, antiphlogistic properties, and as they are the best means of combating progressive inflammation and the burrowing of pus. That the gypsum bandage yet finds so many opponents among surgeons proceeds from the fact that they do not know how to use the plaster properly, and cannot entirely control the bandage. Did they understand how to use the gypsum as an elastic splint-like bandage, clinging to the limb, without support; and, further, to retain the integrity of the edges at the fenestra, preventing the ingress of pus into the bandage, there would remain not a single objection to the gypsum bandage."

fragments adherent to periosteum.[1] The necessity of thoroughly exploring the ball track with the finger, and, if necessary, of enlarging the entrance or exit orifices to facilitate such explorations, as well as the extraction of foreign matters, was generally recognized and acted on.[2] Some surgeons removed fragments with great freedom, whether the periosteal attachments were retained or not.[3] When this was done, it became necessary to remove the pointed extremities of the upper and lower portions of the broken shaft, and the case was transferred from the category of expectant conservative treatment[4] to that of conservation with excision. Before treating further of this series, it is convenient to refer to two varieties of shot injury of the humerus, which, without being extremely infrequent, are by no means common; I refer to the fractures without breach of surface of the soft parts, and to the contusions and partial fractures.

Simple Shot Fractures.—It is my impression that shot fractures of the long bones without injury of the soft parts, are more infrequent than visceral ruptures without external wounds. Medical Inspector Hamilton, however, speaks of bones of a limb broken by solid shot and the integuments not torn as not uncommon,[5] and Professor S. D. Gross met with a case,[6] which he mentions in the last edition of his classical systematic treatise, and this, and four other examples probably referable to this group, are found on the returns.

CASES 1710–14.—Sergeant Thomas Jefferson, Co. I, 1st Artillery (Rickett's Battery), was struck at the first battle of Bull Run, July 21, 1861, "by a twelve-pound shot, which fractured the humerus at three different points but did not even bruise the skin." (GROSS.) He was admitted to the Circle Hospital, at Washington, July 22d. Surgeon Levi H. Holden, U. S. A., reported that he had a shot contusion of the arm and was treated in quarters. On October 30, 1861, he was readmitted with fracture of the humerus, and was treated in hospital until January 20, 1862, and then furloughed for one month. He was readmitted February 7, 1862, and returned to duty, well, February 11, 1862. This completes the hospital record in the case, which is undoubtedly that referred to by Professor Gross. The sergeant re-enlisted July 29, 1864, in Battery A, 1st Artillery, and, on July 3, 1867, was promoted and detailed ordnance sergeant. On August 18, 1867, he was mustered out, and appointed Superintendent of the National Cemetery at Annapolis, and died, of typhoid fever, on May 17, 1868.——Second, Private John Wallace, Co. B, 10th Massachusetts, aged 26 years, is reported by Acting Assistant Surgeon E. E. Andrews as having entered Lincoln Hospital June 13, 1863, with a "gunshot fracture of the middle portion of the left humerus. Wounded at Chancellorsville,

[1] BILLINGS (J. S.), *Report on the Treatment of Diseases and Injuries, in the Army of the Potomac, during* 1864, in *Appendix to Part I, Med. and Surg. Hist. of the War*, 1870, p. 201. In "*Directions to Army Surgeons on the Field of Battle*, adopted by the U. S. Sanitary Commission, and printed, for the use of U. S. A. Surgeons," as Document No. 14, the rule is laid down on page 4 that: "In a case of gunshot fracture of the upper arm, in which the bone is much splintered, incisions are to be made for the removal of *all* the broken pieces which it is feasible to take away." This paper, of which two editions were widely circulated, may have influenced the judgment of some surgeons. The rules laid down were ascribed to GUTHRIE, and, with sundry intercalations, are taken from his writings. The illustrious veteran is styled "Surgeon General to the British Forces during the Crimean War." It is true that he took the keenest interest in the doings of the British medical staff in the Crimea, but he had then long since retired, full of years and honors. He died at the age of 75, May 1, 1856.

[2] Sir CHARLES BELL (*A System of Operative Surgery*, 2d ed., 1814, Vol. II, p. 476) early laid down the correct practice: "A question arises, whether there be any better mode of averting evil consequences than by amputating the limb? In my opinion the practice is obviously this: make a deep and long incision down to the fractured bone, pick away the loose pieces; let those which are long and adhering to the membrane remain till thrown off by the suppuration; dress the wound with lint dipt in oil, so that the lips of the incision do not contract nor the matter and slough be in the slightest degree retained; lay the limb on a wooden or tin splint, and apply wet cloths to the whole extremity. That the cure will be slow must be a necessary consequence, but the evils already enumerated will be avoided, and instead of years of suffering, or the loss of the arm, the patient will preserve a useful member."

[3] Surgeon D. P. SMITH, in *Remarks on the Wounded after the Engagements at Mill Spring* (*Am. Med. Times*, 1862, Vol. IV, p. 332), gives the following observations: "In two instances I removed a large amount of fragments from the shaft of the humerus, in each instance equal to at least two and a half inches of the entire shaft. In each of these cases it was the finger alone, introduced as a probe, that conveyed any adequate idea of the extreme comminution of the bone. Indeed, in military surgery it is, in almost every instance, folly to place any reliance upon or attempt to gain accurate information with an ordinary probe. In these cases, too, the *dispersive* effects of the minié ball were clearly shown, for, not only were fragments of bone driven into all the surrounding tissues, but in one case, where the ball impinged just below the insertion of the deltoid and passed entirely through from the front, I found by my finger a fragment driven into the elbow joint from between the coronoid process of the ulna and the articulating facet of the humerus. About two months after these operations, I heard that the arms had become rigid and were being used. I mention their having become rigid because I thought there was much danger of false joint, inasmuch as the exsections had occurred at the favorite place for that complication."

[4] LÖFFLER (F.) (General-Bericht, u. s. w., 1867, p. 176) lays down the following rules for the treatment of shot fractures of the shaft of the humerus, as deduced from the experience of Prussian surgeons in the Schleswig-Holstein campaigns of 1848–'50: 1. All shot fractures of the shaft of the humerus by small shot and grape or canister shot unattended by injury to the brachial artery admit of conservative treatment. 2. Primary amputation is necessary if the brachial artery is injured. 3. Resection in the continuity as a means of conservative treatment is to be rejected. 4. Primary removal of splinters is to be limited to fragments completely separated and easily accessible. 5. A vigorous persevering antiphlogistic treatment, including particularly local treatment with ice, is beneficial and necessary, in the cases treated on the expectant conservative plan. 6. The early application of firm retentive bandages is unnecessary and injurious.

[5] HAMILTON (F. H.), *A Treatise on Military Surgery and Hygiene*, 1865, p. 194.

[6] GROSS (S. D.) (*A System of Surgery*, 5th ed., 1872, Vol. II, p. 1011). The case to which Professor GROSS refers has been identified, and the details that can be gleaned are given in the abstract above.

May 3, 1863, in action, by a piece of shell, producing contusion and a simple transverse fracture of the left humerus. Union has taken place." It is endorsed on the descriptive list that this man was transferred to McClellan Hospital, at Nicetown, June 23d, and had no treatment, but was detailed as a ward nurse, and, on September 4th, on duty with the hospital guard, and, on October 26, 1863, returned to duty with his regiment. It will be seen that the authenticity of the fracture of the humerus depends on the accuracy of the diagnosis of Dr. Andrews, who found the fracture united forty-one days after the alleged injury. Nothing is found of the case on the field reports, and the soldier's name is not on the Pension Roll.——Third, Private Orson Barrington, Co. B, 25th Wisconsin, aged 24 years, was wounded at Resacca, Georgia, May 14, 1864. He was sent to Nashville, where Surgeon W. H. Thorn, U. S. V., reported a "gunshot fracture of the humerus from a piece of shell." The patient was transferred to Madison, Wisconsin, August 2, 1864, where Surgeon H. Culbertson, U. S. V., reported a "shell fracture of the middle third of the right humerus, with contusion of the soft parts of the middle of the arm." The soldier was furloughed September 2d; readmitted September 29th, with "impaired motion of the arm," and returned to duty April 4, 1865. There is no pension record in the case.——The other two cases are included in the tables on excisions in the shaft of the humerus: One, the case of Lieutenant L. C. Kanouse, is CASE 176 of TABLE LVI, and is entered at page 679 *ante*. This officer received a shot contusion of the left humerus at Winchester, September 19, 1864. Assistant Surgeon C. I. Wilson, U. S. A., reported that there was a primary excision performed on account of a fracture of the humerus. The patient recovered and was mustered out. His name is not on the Pension Roll.——The fifth case, which has been entered in TABLE LXI, p. 692, as CASE 27, is of real value. It is that of Private Eli Schultz, Co. D, 102d New York, aged 30 years, who was wounded at Savannah, December 18, 1864. He was admitted to the 2d division, Twentieth Corps, field hospital, where Surgeon E. Hutchinson, 137th New York, reported: "Contusion of right breast and shell wound of right humerus, with simple fracture. The limb was put up with splints and simple dressings." The patient was transferred January 16, 1865, and admitted to McDougall Hospital, Fort Schuyler, January 29, 1865. Assistant Surgeon Samuel H. Orton, U. S. A., reports: "Simple fracture of the right humerus by a shell fragment. No external wound was made. Ligamentous union has taken place and there remains a pseudarthrosis. The constitutional condition is fair. On March 25, 1865, a straight incision was made three inches in length, on the exterior aspect of the arm over the seat of fracture, cutting down to and around the fractured ends of the bone. The ends of the bone being turned out, nearly half an inch of each was removed by bone-cutting forceps. The ends of the bone were then brought in apposition, the wound closed by sutures and adhesive straps, and immobility of the arm was carefully maintained. On March 31st, the incision was closing; there was moderate discharge of pus, and the bone was in good condition, but there was apparently no attempt at union." This soldier was discharged July 14, 1865, for "fracture of right arm (simple), ununited for five months, but now quite firm after operation, etc." He was pensioned. Examining Surgeon A. H. Crittenden, of Bath, N. Y., certified, May 10, 1866: "Fracture of right arm midway between elbow and shoulder, resulting in non-union. The arm in consequence is a useless appendage. It has been operated upon two or three times, but without relief." Examiner H. L. Robbins, of Lincoln, Nebraska, certified, September 6, 1873: "* * * no osseous union of humerus, muscles much atrophied, and the elbow, wrist, and finger joints almost completely anchylosed from long-continued inability to use the arm. The arm is wholly useless for purposes of manual labor, and is suspended loosely from the upper third of the humerus by the atrophied 'rope-like' muscles of the middle third." The pensioner was last paid March 4, 1875.

The comparative rarity of pseudarthrosis after compound shot fractures has been adverted to on page 673. It is curious to observe that two of the five examples of simple shot fractures of the humerus were characterized by non-union. In one of these rare instances recorded in the German *Ephemerides*[1] also, a false joint occurred.

Paillard, in his narrative of the surgical events at the siege of the citadel of Antwerp, in 1832, gives many interesting details of the effects of contusion by spent projectiles, and mentions a case of luxation of the head of the humerus, without apparent external injury, from the impact of a cannon ball.[2]

[1] ROMBERG (J. W.) (*Eph. med. phys. ger. nat. cur.*, Dec. III, Norimbergæ, Francofurti, et Lipsiæ, 1706, Obs. CLXXV, p. 208) relates that during the siege of London, in 1686, a soldier of the Legion of the Hanseatic town Lübeck had his arm fractured (*raram fracturam*) transversely, three fingers below the head of the humerus, just above the insertion of the deltoid, by a large bomb fragment (pyrobolum). Although there was extensive contusion, pain, loss of motion, and curving of arm and other symptoms, there was no wound. The "legitimate treatment" of application of spleenwort and splints was employed, and, after a few weeks, the patient suffered no pain; there was no deformity of the member, or suspicious color of the external cutis, or any external indication of fracture, aside from the loss of motion, which prevented the abduction of the arm. "Cum vero in calli generationem investigaremus, primo attactu nonsolum nullus apparuit, sed et manu membro transversim imposita, illud in quamcunque partem circa dictum fracturæ locum absque omni strepitu vel molestia blando et facile inflecti poterat, extremitatibus ossis fracti nondum firmatis, sed cartilagine superinductis et munitis, ita ut naturam novam articulationem ex dicta fractura efformasse dixeris." RAVATON (*Chirurgie d'Armée*, 1768, p. 283) records a case of fracture of the right humerus by a cannon ball, "sans former des plaies," in a marine of the frigate Formidable. The case is alluded to in the note to p. 808 *ante*. STROMEYER (L.) (*Maximen der Kriegsheilkunst*, Hannover, 1855, S. 165) refers to simple fractures of bones from shot, and cites the case of a young man, in 1853, whose humerus was fractured in this manner, with only slight lesion of the soft parts. LEGOUEST (*Traité de chirurgie d'armée*, Paris, 1872, p. 466) remarks: "Les premières (fractures simples), sans être rares, ne sont cependant pas communes," and adds "SAUREL a rapporté quelques exemples de ces dernières (SAUREL, *Des fractures des membres par armes à feu*, Montpellier, 1858—according to DEMME, at p. 69, ten cases in 300). DEMME (*Mil. chir. Studien*, Würzburg, 1861, S. 69) observes: "Simple fractures, similar to the usual subcutaneous fractures, or complicated by wounds of the soft parts, occurred more frequently than is generally supposed. Generally they were caused by '*Contusions Schüsse*' of larger projectiles, sometimes also by small projectiles," and adds that, in 1852, PAILLARD observed a simple fracture of the humerus from a spent cannon ball. The latter statement is erroneous; it was a luxation that PAILLARD observed.

[2] PAILLARD (A.) (*Relation Chirurgicale du Siége de la Citadelle d'Anvers*, Paris, 1833, p. 24) remarks: "J'ai vu à l'hôpital militaire d'Anvers, un soldat qui avait reçu un coup de boulet mort à la partie externe et supérieure du bras. Il n'y avait rien d'apparent à la peau, mais une luxation de l'humérus s'était faite. Je ne puis donner d'autres détails sur ce blessé dont j'ai égaré l'observation. Je le regrette, car je l'avais prise avec soin, et ses détails étaient intéressants."

Shot Contusions of the Humerus.—In the subsection commencing on page 666, shot contusions of the humerus are discussed. The views on this obscure subject[1] of Surgeons Lidell and Bontecou, and of Drs. Stromeyer, Beck, and Socin, are cited, and three reported examples that terminated favorably, and three that had a fatal result, are adduced. Pathological specimens from two of the latter are reproduced in PLATE L. I fear that the infrequency of such lesions, which have received slight attention until late years, was overstated. On careful scanning of the reports, sixteen additional instances are found that appear to belong to this group, and references to such cases in foreign campaigns have become more numerous since attention has been drawn to this subject.[2]

CASES 1715–1730.—1. Lt. W. M. Begole, Co. H, 23d Michigan, was wounded at Lost Mountain, June 16, 1864. Surgeon E. Shippen, U. S. V., Medical Director of the Twenty-third Corps, reported from the field a "severe gunshot wound of the left shoulder." At the Officers' Hospital, at Chattanooga, Surgeon L. D. Harlow, U. S. V., reported: "* * The ball grazed the humerus and emerged near the axilla. Hæmorrhage occurred, August 30th, from the superior thoracic, with loss of twelve ounces of blood. The bleeding was arrested by compression and application of solution of persulphate of iron. Hæmorrhage recurred, and death resulted October 15, 1864."——2. Pt. A. Brown, Co. D, 64th New York, aged 26 years, was wounded at Hatcher's Run, March 25, 1865, by a minié ball. Surgeon T. R. Crosby, U. S. V., reported that: "The ball entered the middle of the arm anteriorly, passed upward and backward, and lodged and flattened against the humerus. It was extracted from beneath the deltoid by an incision along its posterior border." The patient recovered, and was discharged from Columbian Hospital May 2, 1865.——3. Pt. J. W. Collings, Co. A, 29th Maine, aged 40 years, was wounded at Cedar Creek, October 19, 1864. Surgeon L. P. Wagner, 114th New York, reported, from the field hospital of the Nineteenth Corps, a "flesh wound of the left arm; simple dressings applied." Surgeon S. J. W. Mintzer, U. S. V., reported the patient's admission into York Hospital, and discharge May 5, 1865, "on account of a gunshot wound of the left arm, with injury to the humerus, resulting in atrophy." Examiner E. Russell reported, May 4, 1866: "The wound is still suppurating; the arm is atrophied, and there is partial anchylosis of the elbow joint."——4. Pt. O. Crippen, Co. G, 41st Ohio, was struck, at Chickamauga, September 19, 1863, in the left arm by a bullet. Surgeon G. Perin, U. S. A., reported a "contusion of the humerus." The patient was treated in Nashville Hospital No. 1, and is recorded by Surgeon C. W. Hornor, U. S. V., as furloughed, re-admitted, and returned to duty January 27, 1864.——5. Pt. H. T. Fleenor, Co. C, 30th Iowa, was wounded at Resaca, May 15, 1864. Surgeon F. Salter, U. S. V., reported, from the general hospital at Chattanooga, "gunshot flesh wound of the left arm." On June 2d the patient was admitted into Hospital No. 2, Nashville. Surgeon J. E. Herbst, U. S. V., reported: "Shot contusion of humerus of left arm." This soldier was returned to duty August 9, 1864. He is not a pensioner.——6. Pt. J. R. Glongre, Co. H, 2d Vermont, was wounded at the Wilderness, May 5, 1864. Surgeon S. J. Allen, 4th Vermont, reported, from a Sixth Corps hospital, that a "conoidal ball, entering near the point of the shoulder, grazed the humerus, and was extracted from the muscles near the lower angle of the scapula." This soldier was treated at Columbian, Summit House, and Baxter Hospitals, and was discharged February 22, 1865, and pensioned. Examiner H. H. Atwater reported, July 18, 1865, that "small portions of the humerus have exfoliated. There are three openings still discharging."——7. Pt. P. Graves, Co. G, 5th Missouri Militia Cavalry, aged 28 years, is reported by Surgeon W. Dickenson, U. S. V., to have received, accidentally, August 25, 1863, "a conoidal ball wound of the left arm at the upper third, with injury of the periosteum of the humerus," and to have been returned to duty December 7, 1863.——8. Pt. J. G. Harvey, Co. G, 39th New Jersey, aged 19 years, was wounded at Petersburg, April 19, 1865. Asst. Surgeon H. Allen, U. S. A., reports from Mount Pleasant Hospital that "a conoidal musket ball had grazed the lower third of the left humerus, the shaft of the bone being denuded of periosteum and somewhat roughened, but not fractured." This soldier was mustered out June 28, 1865. His name does not appear upon the Pension Roll.——9. Pt. J. Haskins, Co. B, 1st Tennessee Artillery, aged 20 years, was wounded April 12, 1864, at Fort Pillow. Surgeon H. Wardner, U. S. V., reported a "gunshot perforation of the upper third of the left arm, with injury of the humerus, but not a clear fracture." The patient recovered, and was returned to duty June 22, 1864; he is not a pensioner.——10. Serg't S. M. Karnes, Co. H, 18th Infantry, aged 24 years, received, at Allatoona, May 27, 1864, a wound of the right arm. Surgeon S. Marks, 10th Wisconsin, reports a "contusion of the humerus." Surgeon B. B. Breed, U. S. V., reports the patient's reception at No. 1 Hospital, Nashville, with a "gunshot wound of the upper third of the right arm, with contusion of the humerus; recovery, and return to duty November 21, 1864;" not a pensioner.——11. Pt. R. H. Leavell, Co. E, 36th Indiana, aged 22 years, was wounded at Dallas, May 27, 1864. Surgeon J. D. Brumley, U. S. V., reported that he entered a Fourth Corps hospital with a "shot perforation of the right arm." The patient was sent to Cumberland Hospital,

[1] Professor L. STROMEYER (*Maximen der Kriegsheilkunst*, Hannover, 1855, S. 155) recognizes two classes of contusions of bone, one with, the other without an open wound, and considers the former far more serious than the latter. "It occurred regularly, that the wounds with so-called grazing of the bone healed much slower, inflamed more severely, suppurated more freely [than perforations of the soft parts], even if, from the direction of the ball, it was to be supposed that the accident was slight." He cites the case of a soldier shot at Colding, in 1849, through the exterior soft parts of the left upper arm. The injury, from the beginning, appeared very slight, and even later caused little difficulty, but would not heal. I saw the patient in September, 1850. The entire humerus was covered with a firm excrescence; some fistulæ, which suppurated only a little, led to a sequester that had not yet become loose. The patient was weak and thin, and greatly inclined to diarrhœa, which increased, and death occurred 14 weeks afterward. In the lungs were crude tubercles; in the colon no ulcers. Nearly the entire diaphysis of the humerus had become necrosed from a slight contusion, with an open wound."

[2] CHIPAULT (A.) (*Fractures par armes à feu*, 1872, pp. 2, 3) records three instances of recovery after shot contusion of the humerus, an injury he designates as "*éraillement*" (fretting, fraying): Transcof, 8th Chasseurs, age 20; the left arm was perforated at the insertion of the deltoid by a musket ball, which touched the humerus. There was intense inflammation, and several small exfoliations. After free incisions a good recovery ensued. Doussy, 4th Marines, aged 23, and Aubonnet, 27th marching regiment, received shot contusions of the humerus, the latter from a shell fragment. Both recovered after copious suppuration, treated by free incision. M. CHIPAULT (*l. c.*, p. 9) gives particulars of six comminuted fractures of the shaft of the humerus treated by expectation, five patients recovering, and the one who succumbed having in addition a shot penetration of the anterior mediastinum.

thence to Totten Hospital, whence Surgeon A. C. Swartzwelder, U. S. V., reported that "a ball passed through the middle third of the right arm, touching the humerus." Thence transferred to Evansville and to Indianapolis, this soldier was mustered out September 11, 1864, and pensioned. Examiner R. Bosworth reported, September 14, 1872, that: "The cicatrix of wound, through which the ball passed, is contracted, and the muscles contiguous to each other adherent. Forearm numb."——12. Pt. A. Lester, Co. H, 134th New York, aged 19 years, was wounded at Gettysburg, July 1, 1863. Surgeon Henry Palmer, U. S. V., reported from York Hospital: "Musket ball penetrated directly below the coracoid process, right side, passed the brachial artery outwardly, impinged against the humerus at the anatomical neck, and, seemingly, glided around the head of the bone without penetrating the joint. Two or three small chips of bone were removed since admission. Has good and free use of the arm except in outward extension. Can scarcely raise it to a right angle with the body; wound of exit still open." This soldier was discharged from Central Park Hospital June 24, 1864, and pensioned. Examiner J. G. Orton, of Binghamton, reported, January 15, 1868: "The action of the joint is very imperfect. The bone is undoubtedly necrosed to some extent." The pensioner died August 18, 1874. Dr. D. S. Burr states that at date of death the wounds were "open and discharging both outwardly and inwardly."——13. Pt. G. Loyd, Co. F, 6th Indiana, aged 27 years, was wounded at Chickamauga, September 20, 1863. Surgeon G. Perin, U. S. V., reported, from a Twentieth Corps hospital, a "shot contusion of the left arm." Assistant Surgeon W. C. Daniels, U. S. V., reported the patient's admission into Hospital No. 2, Evansville, with a "gunshot wound of the middle third of the right arm; the ball entered anteriorly and lodged on the humerus, whence it was extracted. Gangrene supervened but was readily arrested." This soldier was mustered out September 22, 1864, and pensioned. Examiner A. L. Lowell reported, July 25, 1868: "The arm is full, strong, and efficient."——14. Pt. D. Sevage, Co. D, 183d Pennsylvania, aged 29 years, was wounded at Hatcher's Run, February 6, 1865. Surgeon W. R. Dewitt, jr., reported, from a Fifth Corps hospital, "gunshot flesh wound of the right shoulder," and the patient's transfer to Baltimore. Surgeon Z. E. Bliss, U. S. V., reported, from Camden Street Hospital: "* * Ball entered the right axillary space, having passed obliquely through, grazing the humerus, and making its exit in the front four inches below the shoulder joint." Furloughed April 25, 1865, to report to be mustered out of service.——15. Capt. H. C. Schmidt, Co. C, 6th Kentucky, aged 27 years, received at Chickamauga, September 19, 1864, a shot wound of the right arm. Surgeon J. E. Herbst, U. S. V., reported that the ball slightly grazed the humerus. The captain was furloughed September 26, 1863, and returned to duty January 19, 1864.——16. Pt. F. Schneeberg, Co. F, 16th Illinois Cavalry, aged 17 years, was wounded at Atlanta, August 7, 1864. He was treated in several hospitals, the case being registered as a gunshot wound of the elbow. Surgeon B. Cloak, U. S. V., at the Cumberland Hospital, gives the fullest account of the case, and records the diagnosis as a "wound of the right arm, with implication of the humerus." This soldier was discharged August 7, 1865.

Viewing these cases in connection with the six examples of shot contusions of the humerus previously cited, it must be inferred that while necrosis following ecchymosis, or osteitis, suppurative and gangrenous osteomyelitis, and purulent infection, and such direful results, vividly portrayed by Drs. Lidell and Gibbons,[1] occasionally follow such injuries, yet the great majority of shot contusions of the humerus[2] that have been observed have either terminated favorably, or in limited exfoliation, as Dufouart long since declared[3] regarding shot contusions of bone in general; and that there is every probability that many such injuries recover without recognition. In the grave cases, when dull, deep-seated pain announces mischief beneath the periosteum, an incision should be made down to the bone, to relieve tension and permit further exploration. If signs of medullary abscess are discovered, it has been recommended to penetrate the compact tissue of the bone with the trephine.[4] Dr. Lidell insists upon the value, in acute osteitis from contusion, of topical abstraction of blood, and of ice-dressings followed by hot fomentation.

[1] GIBBONS (H.) (*Contused Wounds of Bone*, in *Pacific Med. and Surg. Jour.*, 1866, Vol. VIII, p. 285) remarks: "In the severest of these injuries, in the shafts of long bones, not only is the periosteum, nourishing the external table, destroyed, but the endosteum is separated from its attachment, or otherwise injured, and the entire thickness of bone is deprived of the means of nutrition. The medulla also receives a severe concussion, causing extensive inflammation and subsequent gangrene, which may extend several inches above and below. Whether removal of this gangrenous product, always intensely fetid, could be advantageously accomplished, as by trephining, remains to be proved."

[2] FISCHER (H.) (*Lehrbuch der Allgemeinen Kriegs-Chirurgie*, Erlangen, 1868, S. 50) observes: "A perforation of the cutis and muscles is not necessary in cases of contusion of the bone. If there is a blind shot channel of the soft parts, the missile either remains lodged before the bone, or is deflected and escapes in a changed direction and form. In consequence of the contusion, the periosteum, at the injured locality, is either denuded and underrun with blood, or extensively torn from the bone and suggillated. * * As a constant result of contusion of the bone are found circumscribed demolition of the brittle cancellated tissue, and some extravasations of blood in the medullary cavities of the long bones." Elsewhere, in the same work, Dr. FISCHER says: "As soon as a contusion of bone is followed by dull pain and enlargement of the bone, deep incisions should be made, that penetrate through the periosteum to the affected locality. The then generally already existing, or soon to be developed, necrosis of the contused bone is to be carefully watched, and the sequestra, as soon as detached, are to be extracted, to prevent burrowing of pus and inflammation."

[3] PIERRE DUFOUART (*Analyse des Blessures d'Armes à Feu et de leur Traitement*, Paris, an X (1801), p. 26) devotes several pages to shot contusion and slight losses of substance of bone ("entamures et écornures"), and gives a tolerably good account, and one of the earliest, of the appearances of contused bone. He sums up with the reflection: "Il est consolant d'avertir ici que la contusion des os et la déchirure du périoste donnent rarement do pareilles allarmes; je les ai vu nombre de fois suivre, dans leur guérison la voie douce et prompte des plaies les plus simples."

[4] Dr. WALTER F. ATLEE (*Am. Jour. Med. Sci.*, 1865, Vol. L, p. 119) remarks: "The injuries of bones, caused by balls, are those of all others whose final result has most grievously disappointed all our calculations. * * We have again and again seen a stout fellow sink when one of the long bones had been touched so slightly as merely to carry off a small piece of periosteum. When this happened to the femur, death *always* followed. * * Should such cases again fall under our care, we shall proceed to trepan the bone at the seat of injury."

Excisions in the Continuity.—On page 676 were summed up facts proving that, in formal extended excisions in the shaft of the humerus, the mortality was excessive, and the results in the cases of recovery for the most part deplorable, a third of the number suffering from pseudarthrosis, and nearly a sixth having recourse to ulterior amputations. While the wisdom of removal after shot fractures of the shaft of the humerus of all detached splinters is fully conceded, the assertions of Drs. Loeffler and Schwartz, that formal primary excisions in the continuity shall be absolutely rejected, is not too emphatic.

The plan of wiring together the fractured extremities of the humerus[1] was advocated and practised, in one instance, by Surgeon W. H. Church, U. S. V.,[2] and subsequently, in three instances, by Assistant Surgeon B. Howard, U. S. A.[3] Dr. Church's patient recovered; but it was not believed by the surgeons who observed the case, that the operative interference promoted the cure. Dr. Howard insisted on this expedient[4] as a primary

[1] Although M. BÉRENGER-FÉRAUD has undertaken to ascribe the invention of sutures of bone to HIPPOCRATES, it has been satisfactorily shown by M. LETENNEUR, of Nantes, in a note to the *Société de Chirurgie*, in 1870, that "ξευγνῦναι, τοὺς ὀδόντας" of HIPPOCRATES (*Oeuvres complètes par* É. LITTRÉ, Paris, 1844, T. IV, p. 148) signifies "to attach the teeth together," and that HIPPOCRATES referred to tying the teeth together in fractures of the lower jaw, and not to wiring together the fragments of the maxilla, a position sustained by LITTRÉ and by M. MARTIN, another learned hellenist. As to the historical question, it seems to be agreed that suture of bone is a modern invention. GEORGE W. NORRIS (*On the Occurrence of Non Union after Fractures; its Causes and Treatment*, in *Am. Jour. Med. Sci.*, 1842, Vol. III, p. 51, reprinted in *Contributions to Practical Surgery*, 1873, p. 9) thought it was first practised by ICART (*Jour. de Méd., Chir., et Phar. de* ROUX, 1775, T. XLIV, p. 170). In a fracture of the humerus by a cart wheel, ICART cut down and secured the ends of the bone by iron wire. The patient died on the twelfth day, and ICART was bitterly criticised by PUJOL (*l. c.*, Vol. XLV, p. 167). The practice was revived in July, 1826, by J. K. RODGERS, of New York (Dr. JOHN S. HEARD'S remarkable *Report on Cases of Ununited Fracture, treated at the New York Hospital*, in *New York Jour. of Med.*, 1839, Vol. I, p. 351, details the case of Geo. Westerfield, aged 15, with a pseudarthrosis of the right humerus two inches above the elbow. Dr. RODGERS resected the ends of the bone, and united them by silver wire, and the patient regained perfect motion of the arm, with two inches shortening), and it is stated by Dr. HEARD that it was successfully repeated by MOTT and CHEESEMAN. In 1838, it was again successfully practised by FLAUBERT, of Rouen. (His pupil, LALOY, relates the case—an ununited fracture of the middle third of the left humerus, in a girl of 21 years—in his thesis *De la suture des os appliquée aux résections et aux fractures avec plaie*, Paris, 1839, p. 11.) In 1850, VELPEAU is said to have practised this operation unsuccessfully in a pseudarthrosis (*Gazette des Hôp.*, 1850, p. 233); and LAUGIER repeated the operation on a pseudarthrosis of the right humerus, in a man of 40, in 1855.—(*Comptes Rend. de l'Acad. de Sci.*, 1855, T. XL, p. 935.) In 1859, SANBORN (E. K.) (*The Silver Wire in Ununited Fracture, with a Case*, in *Am. Jour. Med. Sci.*, 1860, N. S., Vol. XXXIX, p. 339) operated successfully on a patient of 33, with an ununited fracture of the lower third of the right humerus of three years' standing, which had been vainly treated by the seton and other expedients. E. S. COOPER and BRAINARD practised similar operations in pseudarthrosis of the femur in 1859–60. In 1865, M. DEMARQUAY (*Bull. gén. de thérap.*, T. LXXI, p. 557) operated on a woman of 20, with pseudarthrosis of the humerus, by wiring together the broken extremities; and in 1872, M. DOLBEAU succeeded in curing a pseudarthrosis of the left humerus, of four years' standing, in a woman of 40, by resecting the extremities of the ununited lower third of the shaft and bringing them into apposition by wire sutures.—(*Bull. gén. de thérap. med. et chir.*, T. LXXXIX, 1875, p. 1.) M. BÉRENGER-FÉRAUD (*De la suture des os*, in *Gaz. hebd. de méd. et de chir.*, 1867, T. IV, p. 611) and M. PIEL (*Essai sur les pseudarthroses*, Thèse, Paris, 1867, No. 6) have collected numerous other instances of the sutures of bones, principally of the lower maxilla and femur.

[2] Dr. CHURCH'S patient was Private H. Claffey, 21st Massachusetts, who was operated on at New Berne, April 15, 1862, a month after the reception of the injury, by Dr. CHURCH, assisted by Surgeon G. DERBY, 23d Massachusetts, and the writer of these lines. The particulars of the excision are recorded in TABLE LXI, p. 692, CASE 4. This man recovered and is still living, with a comparitively useful limb. Examiner B. S. SHAW, of Boston, reported, April 25, 1863: "* * He now has anchylosis of the shoulder without the slightest motion. There is shortening of the arm with great deformity." The Worcester Examining Board (Drs. MARTIN, CLARK, and WOOD) reported, September 4, 1863: "* * bone three inches shortened, shoulder joint stiff, sore, and painful; disability rated total."

[3] The operations for suture of bone after shot fracture of the humerus reported as practised by Assistant Surgeon HOWARD, U. S. A., occurred after the battles of the Wilderness and Spottsylvania, in May, 1864. The first case was that of Sergeant G. Chrispin, 10th Pennsylvania Reserves, and is reported in TABLE LVI, on p. 677, as CASE 61. He was treated in Carver and Chester hospitals, and was discharged and pensioned July 18, 1865. Examiner S. G. Snowden, of Franklin, Pennsylvania, reported of this pensioner, January 31, 1870: "Gunshot fracture of right humerus at upper third. Exsection of a portion of humerus, followed by complete atrophy of the deltoid muscle. The biceps is also partially atrophied. The cicatrix is large, depressed, and tender." Examiner W. S. WELSH, of Franklin, reported, September 14, 1873: "The ball carried away the belly of the deltoid muscle, leaving an adherent cicatrix two and a half inches in length and two inches in width. There was considerable destruction of bone. The arm is three-fourths of an inch shorter from the shoulder to the elbow than the left, and much atrophied." This pensioner was paid December 4, 1874. The next case was that of Private Charter, reported at page 683 *ante*, in TABLE LVII, as CASE 21. This patient submitted to consecutive amputation at the shoulder (see TABLE XLIX, CASE 6, p. 650), and died, from tetanus, October 21, 1864. The third case was that of Private Meisner, recorded on page 679 as CASE 215 of TABLE LVI, and fully detailed in Dr. HOWARD'S paper on *The Application of Sutures to Bone in Recent Gun-Shot Fractures*, in the *Medico-Chirurgical Transactions*, London, 1865, Vol. XXX, p. 247. This man was discharged June 16, 1865, and pensioned. Examiner H. L. HODGE, of Philadelphia, certified at that date: "Resection in the shaft of the humerus has been made on account of gunshot wound. The wound is not yet healed, and the arm is still useless." On September 12, 1873, the Dayton, Ohio, Examining Board (Drs. JEWITT, BECK, and DUNLAP) certified: "A very deep scar, adherent to humerus, in upper third of left arm, in front; scar between two and three inches long. A deep and much longer scar posteriorly. The pensioner states that there has been resection of two inches of the humerus; bony union. Cannot raise arm to horizontal line. Hand in pronation, and he cannot supinate; has very little strength in hand." The pensioner was paid March 4, 1875.

[4] Assistant Surgeon BILLINGS, U. S. A., has expressed (*Appendix to Part I, Med. and Surg. Hist. of the War*, 1870, p. 24) the disapprobation with which Dr. HOWARD'S operations for primary suture in gunshot fractures of the humerus were regarded by the medical officers of the Army of the Potomac. On December 23, 1863, Dr. HOWARD sent to the Surgeon General a memoir, which is printed in full below, describing his proposed operation. He published (*Am. Jour. Med. Sci.*, 1865, Vol. LXIX, p. 351) a *Description of a New Bone Drill* (with eight wood-cuts), and the same year a paper, already referred to, in the *Medico-Chirurgical Transactions*, of London, and publicity was given to the plan through many other channels. This officer laid before the profession, in rapid succession, propositions for "hermetically sealing" chest wounds, for ligating the intercostal artery with inclusion of the rib, for a new form of ambulance wagon, and for a new method of ligating vessels in the continuity (the latter proposition was adjudged a prize by the *Am. Med. Association, Essay on the Treatment of Aneurism*. See *Transactions*, 1870, Vol. XXI, p. 499). It may be said that each of these plans were based on ideas of value within limited spheres of application, although devoid of originality, and were urged with such unreasonable pertinacity that they were fruitful in notoriety rather than usefulness. I have sacrificed much space (*First Surg. Vol.*, pp. 497–514) to a demonstration that the

operation "specially adapted for the field." His operations were regarded, I think most justly, with general disfavor by the experienced field surgeons of the Army of the Potomac.

recorded facts disproved Dr. HOWARD's assertions regarding treatment of wounds of the lung. It would be easy, but tedious and profitless, to refute the claims advanced for the other alleged improvements, and to show that they caused mischief before their worthlessness became apparent. The communication to the Surgeon General is appended as a document bearing on the surgical annals of the war:

"PRIMARY RESECTIONS AND THE USE OF METALLIC SUTURES IN GUNSHOT FRACTURES OF THE SHAFT OF THE HUMERUS.—Conservative surgery, which alone can inscribe living records in the archives of our profession, is the absorbing consideration with every surgeon, feeling as he does that he never achieves a triumph but when he saves. Too much pains cannot be taken, especially to preserve the upper extremities; for while an artificial leg of great utility and beauty may be readily obtained, nothing really useful can be substituted for a natural arm; the amputation of the smallest portion is an irreparable loss. *Conservatism* is one thing, *Conservation* is another. The tendency to the former having its origin more or less in feeling, has often acquired an impetus which has carried us beyond the latter. We have attempted too much to *keep* what we could not *save;* the result too often being not only the loss of the part we attempted to save, but of the entire limb, or ending perhaps in the death of the patient. In the official consolidated statement of gunshot wounds for September, October, November, and December, 1862, compiled by Surgeon BRINTON, U. S. V., and to which alone I shall here refer for statistics, we find that of two hundred and twenty-eight excisions performed on the upper extremities, all but thirty-three were secondary operations. Now, if the remaining one hundred and ninety-five were at all any proper subjects for resection, most of them were probably never in such a favorable physical condition for the operation as immediately after the reception of the wound, for fighting men generally are healthy men. Moreover, it is interesting to enquire what percentage this one hundred and ninety-five formed of the whole number who were originally proper subjects for primary resection, but who in consequence of intercurrent diseases, superadded as a result of delay, were subsequently obliged to submit to amputation, or perhaps to a fate still worse. For we find that while there were but one hundred and twenty-six primary, there were four hundred and one secondary amputations. Of these we can hardly suppose that more than a small part could have been considered subjects for amputation at all, when first wounded. The unsuccessful attempt to save the rest by other means, resulting in submission to the same operation subsequently, and under much more unfavorable circumstances, is one of those facts which have supplied a forcible argument for extensive primary amputations. In gunshot fractures of the humerus, every field surgeon knows that there are usually but two questions uniformly presented for consultation: "Shall we amputate?" or, "Shall we put it up in splints and leave it just as it is?" Between these distant points opinion is ever vibrating. Many who ventured to adopt the latter course a year ago have since found that their *conservatism* resulted in so little *conservation* that they have swung straight back across the intervening chasm to the simple plan of treatment by amputation. In the following remarks I shall endeavor to compare faithfully the different plans of treatment usually adopted, to let it appear that in some cases both extremes are variably improper, and that in many others both are equally and positively wrong. I shall try to show that by a new application of an old principle a happy medium, however, is found, in which the dangers attending both extremes are measurably diminished. From the authority above quoted we find that this treatment has been followed in more than thirty-three per cent. of gunshot fractures of the humerus with a mortality of more than 24 per cent. This does not appear very conservative, and is perhaps a more serious result than is generally apprehended. This method of treatment, then, gives us certain loss of arm with 24 per cent. risk of life. Suppose the operating surgeon, on examination of the case on its arrival at a field hospital, finds an ordinary gunshot fracture of the humerus, with comminution of from two to four inches, and orders it to be put up in splints (an operation which is usually performed more carelessly than any other on the field); an assistant applies them as well as he is able with the limited means at his command, trying to put up the limb firmly, and making pressure which is likely to become increasingly painful. The patient is transported overland say from twenty to fifty miles in ambulance or railroad car. At every motion of the vehicle the sharp comminuted fragments are moving upon each other and lacerating the soft parts in which they are contained like gravel in a bag; the vessels and nerves are continually exposed to injury from them, while the danger is increased every time a change of surgeons or arrival at a different hospital becomes the occasion of a removal of the dressings and a re-examination of the wound. Meanwhile the parts become inflamed and painful and profuse suppuration occurs. Nature has now to do the work first of *police*, second of *repair*. The primary fragments of bone or those wholly detached begin gradually to extrude themselves week after week; still later the secondary are endeavoring to find their way outward month after month—the larger pieces macerating, softening, and disintegrating, preparatory to final exit. The parts are a centre of constant irritation; the peculiar deformative pus resulting from inflammation of the deep-seated tissues tends to burrow in every direction; the fractured ends of the shaft are bathed in it, and instead of preparing to unite are becoming liable to fall into a state of necrosis; the open mouths of the veins of the bone are constantly exposed in the same manner, and phlebitis, pyæmia, gangrene or other intercurrent diseases may occur. Non-union may renew the original question of amputation, or death may ensue from constitutional depression. The case may, however, go on toward recovery. The tertiary sequestra of Dupuytren, consisting of detached fragments of bone which have become embedded in callus, are yet, and while they remain must ever continue, foreign bodies—so that after apparent recovery they may be reserved as causes of more serious trouble for ten or twenty years afterward—so says Dupuytren. The best result this treatment usually furnishes, then, is a painful, slow and tedious recovery, with shortening corresponding to the extent of original comminution; subsequent deformity of bone, induration, and atony of soft parts, and general changes of structure remaining for a longer or shorter period. Let us take a view of the same patient treated by this method: The seat of fracture has been cut down upon; all spiculæ of bone have been removed, the ends of the divided shaft have been made smooth by the saw; the lips of the wound have been brought together with sutures or adhesive straps, and the arm has been put up in the best possible manner which can be obtained by splints and bandages. The chief causes of irritation are now all removed and the patient is in a greatly improved condition. But coaptation is not secured and cannot be maintained. The patient is put into an ambulance wagon; the bandage becomes loosened, the splints displaced. The ends of the bone are all the time apart, all the time in motion. Every time the patient rises the weight of the forearm drags the ends of the bone still farther asunder, and this weight is thus sustained by the soft parts between the divided ends of the bone. Though in a much better condition than where the fragments are allowed to remain, there is motion enough to set up considerable inflammation, and the space formerly occupied by three or four inches of bone has become a convenient pouch for the collection of pus, while a large amount of new material has to be formed. The best result which can be usually anticipated is a false joint with an arm like a flail. The impossibility of approximating the ends of the bones has made this treatment very unpopular in the field. Notwithstanding, I have often adopted it in preference to the two other methods previously mentioned. The treatment which I propose as being specially adapted for the field is, to make a straight incision down to the seat of fracture and proceed as in the usual manner for resection, taking special care to remove all spiculæ of bone and other foreign bodies. Turn out the fractured ends of the bone and saw them off smoothly, and with a view to accurate mutual adaptation, at the same time using the different styles of fracture to such advantage as to secure the most perfect apposition with the least shortening. Unite the two ends with sutures of annealed iron wire secured firmly by twisting, taking care to leave no kink in the uniting loop which may be afterward straightened out by the weight of the forearm, loosening the suture and allowing of motion. With a sharp scalpel shave away any dead mass about the track of the ball, reducing it, as nearly as may be, to a simple incised wound. Everything of the nature of a foreign body having been removed, and the wound being now perfectly clean, bring the edges together with sutures. Side splints may now be applied, or, by preference, one of pasteboard, or any flexible material in addition, bent at a right angle so as in common with the sling which is afterward applied to receive the weight of the forearm. A retentive bandage is the only further dressing required. Treatment by irrigation may be kept up by the patient from his canteen, as his feelings may indicate. The patient is now secure against every emergency incident to transportation. He may be jolted on the road to any extent, the dressings may become displaced, or the splints even may be removed, but the ends of the bone remain in perfect apposition and at rest. So secure is the fastening, that, after the application of the sutures on the subject, I have allowed the arm to drop, and appended to the wrist a weight of fifty-six pounds without producing displacement. The chief causes of inflammation and suppuration are now entirely removed, and the necessary dressings are so light that any tendency to it is the more readily controlled by the freedom with which cold applications can be made. The soft parts being crowded up around the approximated ends of the bone, no interspace is left for the admission of air or collection of pus. Nature has simply to address herself to the work of repair to restore union; and the utility of the limb promises to return promptly, without that delay after union is secured which is the result of those structural changes which occur where the continued causes of irritation and inflammation have not been removed. The shortening need not be greater than in any other treatment,

It has been fully shown that primary excisions in the shaft of the humerus for shot injury are inadvisable, and this particular form of excision, involving a tedious operative procedure, is singularly ill adapted to field practice. That it may be advantageously employed in certain cases of pseudarthrosis of the humerus, is rendered probable by the results published by M. Ollier and Professor H. J. Bigelow. Dr. O. Heyfelder (*Lehrbuch der Resectionen*, 1863, S. 226) professes to give twenty-seven cases of excision in the shaft of the humerus for shot injury, with eleven deaths; but several of his examples of recovery are

as, by proper management, a fracture extending four inches may sometimes be so sawn as to create a shortening of but two inches when united. *The amount of bone which may be removed* must vary in different cases, and be always left to the discretion of the surgeon. On the subject, where the advantage of contractility of the muscles is absent, I have, on a very muscular subject, had some puckering of the outer wound after removing three inches. I have, however, repeatedly removed four and four and a half inches without any inconvenience from the protrusion of muscle on closing the wound. In any case, it is safe to proceed with all the steps of the operation as if preparatory to uniting the ends of the bone. If the approximation cannot be completed without making it difficult, or impossible, to close the outer wound, it may, if preferred, be left open; or the ends of the bone may be left apart. The best thing possible will have been done so far, and the best of the ordinary modes of treatment may now be pursued. Should there be but a slight superabundance of muscle, it is a small consideration; nature will soon dispose of what she does not want by absorption. *Compression of the artery* might be apprehended from the crowding up of the muscles on the approximation of the ends of the bone; but we must remember that the pressure is made directly in the axis of the limb and muscular fibres rather than transversely; that the artery is exceedingly elastic, gliding in its sheath, and always ready to contract. We have never heard of any bad results to circulation by simple shortening from fracture, where not only muscle is similarly crowded, but where no portion of bone has been removed to increase the room for it. The danger to the vessels from compression is certainly much less than that from spicule of bone where they are allowed to remain. *Respecting the wire as a foreign body*, nothing need be said, its similar use in other cases being universally approved and adopted. If desired, the patient, having arrived at general hospital, and the bones become knit, the wire can readily be removed; or it may be left to work its way out unaided, which it will do without any serious discomfort to the patient. In order to facilitate this method of treatment and make it easily practicable in the field, where it is of most importance, I have invented a bone drill, which works very rapidly, and is much simpler and cheaper than anything else of the kind in use. Its chief advantage, however, is, that its portability is such that it can be crowded into almost any field-case without any compartment having been specially provided for it. It can be used sometimes more conveniently than a more elaborate instrument, and is in all cases as expeditious and efficient. As seen in FIG. 578, the instrument consists of a stock and movable drill. The stock is about three and a half inches long, the drill about an inch and a half or two inches. The drill is inserted into the shaft of the stock and secured by a little spring-catch. The steel shaft of the stock into which the drill is inserted is provided with a wheel with a hollow groove, and it revolves on its axis by means of a little pivot wheel let into the handle. FIG. 577 is simply a straight strip of thin steel with a hole in one end and a notch in the other. A knot is made in one end of a piece of catgut; the other is passed through the hole and made fast to the notch at the other end, constituting a bow. The string of the bow is passed around the wheel-shaped part of the stock, and revolution may be produced at any velocity required. The stock is the only part for which a special compartment might be desired in a field case. The drills, of which there are four varieties, when not in use are packed inside the handle, which is made hollow for that purpose. The bow can be laid open or alongside the saw. FIG. 578 shows an exploring drill, which I have invented for the subcutaneous examinations of bony tumors, etc., their character being ascertained by submitting the successive contents of the hollow drill to the microscope, etc.; also a caries drill, likewise a concave drill, which for some purposes works more freely than any other. The drill attached is the only one needed in the field. For other than field purposes, Tiemann, of New York, affixes a handle to the bow, and otherwise makes the instrument in different degrees of elegance. The manner in which I prefer to apply the sutures is shown in FIG. 577. By using two sutures thus, and passing them as nearly as possible through opposite sides of the same bone, great firmness is secured, and if left to come away of themselves by ulceration, both of them together accomplish it in less than half the time in which it could be done by one wire, which should be passed through the opposite cortical portions of each end of both fragments. Also, if desired, they can be withdrawn with greater facility. *The apparent advantages of the treatment proposed over amputation* are: Greater probability of ultimately saving the limb, diminished shock, and less risk of life. *It is better than simple application of splints*, because the irritation, peculiar suppuration, the injurious pressure of tight splints, disintegration of detached fragments, necrosis of the fractured ends of the bone, exposure to phlebitis, pyæmia, and danger from 'tertiary sequestra,' with their various attendant risks, are all avoided, or the probability of their occurrence is greatly diminished. *It is better than simple resection*, because non-coaptation, the intervening space for admission of air and collection of pus, motion of the ends of the bone, and probability of false joint, are avoided. In addition to these negative advantages, there are more or less the positive ones, of sound medulla, sound bone, healthy periosteum, each respectively in apposition and at rest. We have a healthy patient who has not to submit to a tedious constitutional drain before the reparative process can be rendered possible; but one who, having little to do, has surplus strength adequate to the task, and everything tends toward a *prompt recovery*. This plan of treatment is applicable mainly to the humerus. It should be performed in all cases where amputation would otherwise be resorted to on account of the degree of the comminution of the bone. If applied with discretion, it may appear that *amputation of the arm, either primary or secondary, need be of but rare occurrence*, except where rendered necessary by injury of vessels or extensive destruction of soft parts. I would not restrict its application to the humerus alone; there may be cases of fracture of the femur where it is just as applicable. In such cases amputation is at once excluded from consideration. Should there be an inclination to preserve the limb as it is, it would be difficult to show what harm could be done by removing entirely detached fragments, by reducing the rough fractured ends of the bone to a smooth surface, or, in view of transportation, what evil could result from securing the smooth surfaces in perfect apposition, and certain rest, wherever practicable. Is it not rather apparent that, under these circumstances, we may fairly expect, according to the theory of Virchow, that the medulla and the apposed periosteal surfaces will, alone, almost entirely effect a complete repair; thus preventing the demand upon the soft parts for that superabundant mass of provisional callus which, under other circumstances, is thrown out, and so much of which subsequently remains, embarrassing the proper action of the parts, until removed by a slow process of absorption? The principles are plain and unvarying; their application can be governed only by circumstances, and directed by the judgment of the surgeon in each particular case. The time necessary to perform this operation is greater than for amputation. Presuming, however, that the surgeon's own humerus is the one in question, according to the golden rule of every conscientious man, and the consideration of a little more or less of time or trouble would not be entertained for a moment; that plan of treatment

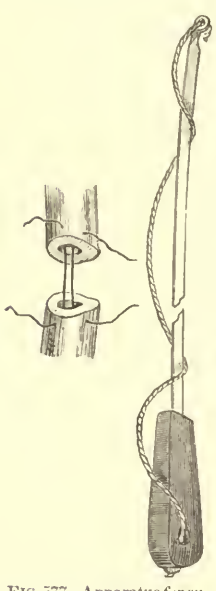

FIG. 577.—Apparatus for suture of bone. From a drawing by Dr. B. HOWARD.

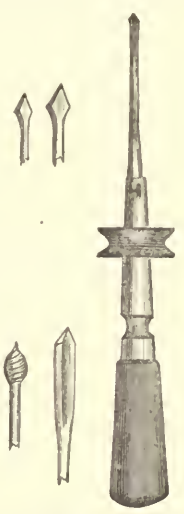

FIG. 578.—Bone drill, from a drawing by Dr. HOWARD. *Spec.* 4080.

either unauthentic or duplicated; yet, even on such data, he concludes that resection in the continuity of the humerus should only be practised for the removal of protruding ends of the bone, hindering its reposition; otherwise shot fractures of the diaphysis of the humerus should be severely let alone,—"möglichst sich selbst überlassen."

Among the varieties of dressing employed after excisions in the shaft, the felt or adaptable porous splints, devised by Dr. David Ahl, gave much satisfaction.[1] It was practicable to use them with fenestrated openings and with water lotions, and some surgeons thought that they realized the advantages without the disadvantages of the gypsum dressings.

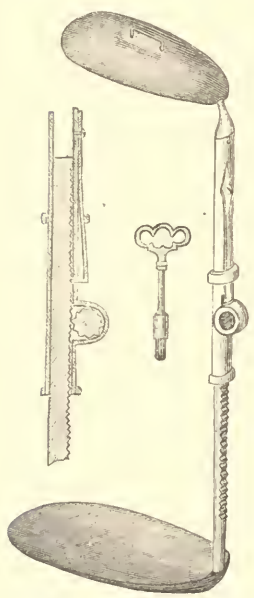

FIG. 579.—Dr. H. A. Martin's splint for excisions and fractures of the shaft of the humerus. *Spec.* 5574.

In addition to the plans for making extension after excisions of the shaft of the humerus mentioned on pages 509, 562, 812, 813 *ante*, was one proposed in 1869, by Dr. H. A. Martin, of Boston, which, though unlikely to come into general use, may prove serviceable under certain circumstances.[2]

Amputations in the Continuity.—It has been shown that the mean mortality after amputation in the continuity of the arm in the War was 23.6 per cent., a larger death-rate than that presented by Norris, Hayward, Buel, and Stone,[3] for the results of this operation, for disease or injury, in American civil hospital practice; but comparing very favorably with any authentic statements that have been published regarding the surgery of other wars. This appears clearly on consulting the figures in TABLE CIV, on page 826. There are several points to which it is important to revert.

I think that it may safely be assumed, from the evidence adduced, that amputation at the upper third of the arm is less dangerous than exarticulation at the shoulder, and should always be preferred to the latter operation when the alternative is presented. This is one of

alone would be adopted which was considered absolutely best for the patient. The operation, however, need not be a long one, if plenty of room be allowed to clear out the fragments of bone. By far the most tedious part, and one which I have labored to overcome, is made easy by the use of the little drill described. Though unable to cite field experience in this plan of operation, I have, with ease, drilled the four holes in the femur and completed the process of wiring on the subject in about five minutes. For such little additional trouble we are certainly well rewarded. The tedious resections which I have performed on the field, some of which were done under fire, have given me more subsequent satisfaction than the amputations after many battles, all put together. The treatment and transportation of gunshot fractures is one of the most important and interesting subjects which has occupied the attention of military surgeons during the present war. The chief questions being: First, how to avoid the consequences arising mainly from the presence of detached fragments and spiculæ of bone? Second, how to prevent the present fearful exaggeration of those consequences by unavoidable transportation? By removing the cause of the former, and by maintaining perfect apposition and rest during the latter, in the manner described, I think these desiderata are obtained, and, when practicable, will furnish better results than any other treatment previously adopted or recommended.

ANNAPOLIS, MD., *December* 18, 1863. (Signed) B. HOWARD, *Assistant Surgeon, U. S. A.*"

[1] AHL (D.), *Surgeons' Splints and Improved Adaptable Apparatus*, New York, 1866, pp. 16. *Adaptable Porous Splints, with Directions for their Employment*, Newville, 1875. Surgeon-General C. A. FINLEY ordered a thousand sets of these splints for army use, and more than a thousand additional sets were subsequently procured by the purveyors.

[2] Professor F. H. HAMILTON, in the 5th edition of his *Practical Treatise on Fractures and Dislocations*, 1875, p. 250, figures and describes this apparatus, and says: "In my opinion, and in the opinion of nearly all practical surgeons who have written upon this subject, it is impossible, by these or any other similar contrivances, to make extension in fractures of the humerus. * * The adhesive plasters must inevitably fail to retain their places even when a moderate amount of traction is continually made upon them." The apparatus of Dr. H. A. MARTIN, Lieutenant Colonel, and formerly Surgeon U. S. V., was submitted to the Surgeon General in May, 1869, and referred to a board of medical officers (Assistant Surgeons WOODWARD, CURTIS, and OTIS), which reported as follows: " * * The advantages claimed for the apparatus are that it provides a firm point of resistance for extension without injurious pressure anywhere, avoids the necessity of irksome removal and repetition of dressings, and furnishes means of preserving an unchangeably proper relation between the elbow and shoulder, thus precluding overlapping or angular deformity. The board were of the opinion that the shoulder cap secured by adhesive strips across the chest and back, provided a satisfactory mode of counter-extension; that the apparatus, like other bracketed splints, afforded a ready means of access to the wound in compound fractures or excisions, and that it secured immobility of the arm, if not absolutely, at least to a satisfactory degree, and in a convenient manner. Though not convinced that extension is frequently required in fractures of the humerus, the board considers this apparatus an excellent means of effecting this purpose when requisite. It furnishes, moreover, a convenient means of supporting the arm and forearm after excisions of the humerus. * * With these exceptions, the appliance was regarded by the board as an ingenious one, which might be made quite useful in a limited number of cases."

[3] NORRIS (G. W.), *Stat. Account of the Cases of Amputation at the Pennsylvania Hosp.*, in *Am. Jour. Med. Sci.*, 1831, Vol. XXII, p. 363. HAYWARD (G.), *Stat. of Amputation of Large Limbs at Mass. Gen. Hosp.*, in *Am. Jour. Med. Sci.*, 1840, Vol. XXVI, p. 64, and in *Surgical Reports*, Boston, 1855, p. 142. BUEL (H. W.), *Stat. of Amp. in the New York Hosp.*, in *Am. Jour. Med. Sci.*, 1848, Vol. XVI, p. 33. STONE (J. O.), *Amput. and Comp. Fract., with Stat.*, in *New York Jour. of Med.*, 1849, Vol. III, p. 297. The number of cases of amputations is not large, but they are most conscientiously recorded and analyzed.

the few instances in which a favorite dictum of the celebrated Larrey has been reversed by the experience of modern military surgeons.[1] Experience does not justify the assertion that there is great liability of consecutive arthritis after section of the humerus at the surgical neck. The rounded form of the shoulder is preserved by leaving the head and even the smallest portion of the shaft of the bone; and it is quite remarkable how serviceable even the shortest stump may become. Many pensioners thus mutilated can hold in the axilla a cane, umbrella, or a small parcel, and leave the sound limb free for use. Moreover, by such a stump the adaptation of an artificial limb is greatly facilitated. A comparison of the annexed figures (FIGS. 580, 581), drawn from patients at Harewood Hospital, with those of the subjects of exarticulation at the shoulder, on pages 616, 618, etc., illustrate the advantages of the operation in the continuity.

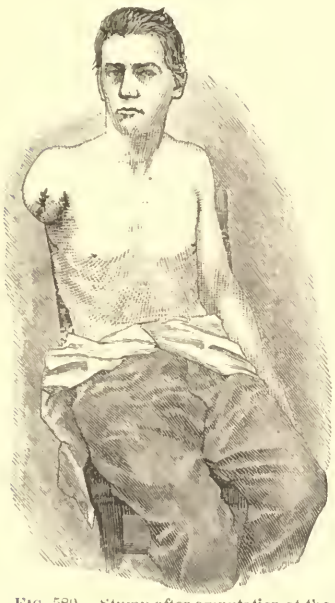

FIG. 580.—Stump after amputation at the surgical neck. TABLE LXVIII, CASE 509.

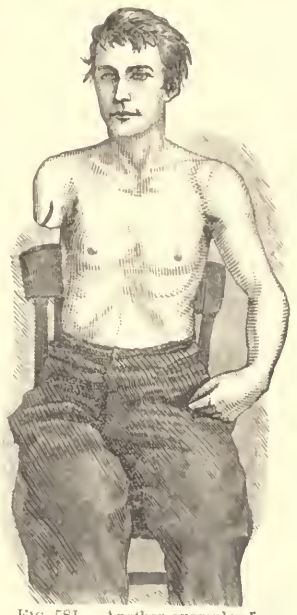

FIG. 581.—Another example of amputation near the shoulder. [From a photograph.]

The uniformity with which amputations at the lower third of the arm afford less favorable results than ablations higher in the continuity, and than exarticulations at the shoulder even, is another point deserving of attention. This exaggerated fatality in the amputations in the aggregate series reported in this Section is not fortuitous; for it obtains not only in the several groups of primary, intermediary, and secondary operations, as shown in the TABLE CII, following, but also in the only other statistical summaries, by Professors Günther and Warren, as cited in TABLE CIII, in which the question has been examined from this point of view. This curious result has been noticed on pages 739 and 806.

[1] LARREY (D. J.) (*Mémoires de Chirurgie Militaire et Campagnes*, 1812, T. III, p. 400) says: "Lorsqu'elles [les blessures du bras] s'étendent très-haut au lieu de conserver un très-court moignon formé avec l'extrémité supérieure du membre, il vaut mieux l'extirper à l'articulation; car, lorsqu'on ne peut pas faire la section de l'humérus, tout au moins au niveau de l'attache tendineuse du deltoïde, le moignon est rétracté vers le creux de l'aisselle, par le pectoral et le grand dorsal. La ligature des vaisseaux qu'il faut porter profondément dans le creux de l'aisselle, irrite le plexus brachial, et augmente cette rétraction, qui ne peut se faire sans douleur ni tiraillement extrêmement incommodes à l'invalide. Souvent cette cause amène le tétanos: le moignon reste toujours engorgé, et l'humérus finit par s'ankiloser avec l'omoplate, en sorte que cette portion du bras est tout-à-fait inutile à l'individu et l'expose à des accidens. J'ai vu plusieurs soldats et officiers de toutes classes regretter de n'avoir pas été amputés à l'article." GUTHRIE (*Treatise on Gunshot Wounds*, 3d ed., 1827, p. 508, and *Commentaries, etc.*, 5th ed., 1855, p. 113) emphatically dissents from this opinion of LARREY, and earnestly recommends that the humerus shall be sawn a half inch or inch below the tuberosities, whenever it is practicable, in preference to disarticulation, regarding this operation as safer, and as avoiding the unseemly elevation and projection of the shoulder resulting from exarticulation. JOBERT (de Lambelle), on the other hand (*Plaies d'armes à feu*, 1833, p. 339), supported the views of LARREY, and advised exarticulation at the shoulder in shot injuries requiring amputation, whenever it was impracticable to saw the bone below the insertion of the deltoid. This exaggeration he justified by alleging that union was more prompt after disarticulations than after amputations in the continuity of the upper third; secondly, that the loose cellular tissue uniting the deltoid to the humerus was prone to conduct inflammation to the shoulder joint; and thirdly, that phlebitis was common in amputations high up in the continuity,—all these assertions being founded on altogether insufficient proof. Many of the French military surgeons adhered to the precept of LARREY. Thus, for example, BÉGIN (L. J.) (*Nouv. Elém. de Chir. et de Méd. Opér.*, 1838, T. III, p. 937) declares: "Si la section devait porter au col chirurgical de l'humerus on devrait opérer plutôt dans l'articulation." On the other hand, DR. HARALD SCHWARTZ (*Beiträge zur Lehre von den Schusswunden*, 1854, S. 215), treating of amputations high in the arm, in the Schleswig-Holstein war, remarks: "We preferred amputation high up, often only an inch below the head of the humerus, to exarticulation at the shoulder, partly because *we considered it less fatal*, partly because it preserved the rounded form of the shoulder. We never observed necrosis of the humerus when it was divided so near the shoulder." PIROGOFF (N.) (*Grundzüge der Allgemeinen Kriegschir.*, 1864, S. 800) teaches: "In shot fractures of the upper third of the diaphysis of the humerus—even where they extend to the extreme end of the upper epiphysis, but leave the head and capsule uninjured—I prefer the amputation close to the limits of the joint capsule to exarticulation. This amputation has, regarding the healing of the wound and the infiltration of pus, given equal and even better results than amputation through the joint (the ratio of mortality in both operations fluctuates between 25 and 35 per cent.), and, as regards the secondary bleeding and deformity, the results of the high amputation are much more favorable. I have, as yet, lost not a single patient from secondary hæmorrhage after this operation, but have seen several perish from this cause after exarticulation." BECK (B.) (*Chir. der Schussverletzungen*, 1872, S. 789) asserts: "This method (the circular) made it possible to operate close to the shoulder joint wherever the lesion of bone will yet permit an amputation through the surgical neck; in such cases I prefer the high amputation to disarticulation, as being less dangerous on the one hand and more apt to give a serviceable stump on the other."

TABLE CII.

Tabular Statement showing the Percentages of Mortality of the Various Subdivisions of the Fifty-four Hundred and Fifty-six Amputations of the Arm for Shot Injury.

OPERATIONS.		CASES.	RECOVERIES.	DEATHS.	RESULT UNDETERMINED.	PERCENTAGE OF MORTALITY.

I at first ascribed this excessive fatality of amputations at the lower third of the arm[3] to the fact that the slighter injuries of the elbow were treated by expectation or excision,

[1] GÜNTHER (G. B.), *Lehre von den Blutigen Operationen*, Leipzig, 1859, B. III, Abschnitt XII, S. 101.

[2] WARREN (E.), *An Epitome of Practical Surgery for Field and Hospital*, Richmond, 1863, p. 397.

[3] There were 1952 amputations in the upper third of the arm (exclusive of 866 exarticulations at the shoulder), 1739 amputations at the middle third, and only 758 amputations at the lower third. There were 626 cases of excisions at the elbow; and although the resulting mortality was 23.7, it might be argued, with a *petitio principii*, it is true, that had these cases been submitted to amputation at the lower third, the mean fatality of this operation would have been reduced below the death-rate of amputations higher up. I have unavailingly made many sections of prepared and recent humeri—longitudinally, obliquely, and transversely—with a view of discovering some anatomical explanation of the greater fatality of amputations at the lower third. It has been suggested that section of bone below the entrance of the nutritious artery is more liable to be followed by osteitis and osteomyelitis; but such is not the rule in other long bones. The section in amputations at the lower third is made through the smallest periphery of the bone, and where its structure is least compact, and reparation might, *a priori*, be expected to be most rapid. I think that the cause is to be sought in the structural arrangement of the soft parts rather than in the bone. Professors WARREN and GÜNTHER statistically proved the fact that the rule that amputations augment in fatality as the trunk is approached, appears to be here invalid, without noticing the importance of the conclusion. Professor SÉDILLOT, however, in his important memoir (*Du traitement des fractures des membres par armes de guerre, in Gaz. méd. de Strasbourg*, and *Arch. gén. de méd.*, 1871, Sec. 4, T. XVII, I, pp. 49, 382) speaks of the subject as "deserving the most serious consideration." I did not receive this masterly paper until I had long devoted much serious though unsuccessful study to the question. M. SÉDILLOT terms the insertion of the deltoid (*creux deltoidienne*) the place of election in arm amputations, and asserts that he has ascertained incontestably that those amputated at that point "ont gueri plus promptement et en plus grand nombre." "Here," he says, "the circumference of the limb is less, and the wound less extensive, the fasciculi of the biceps, triceps, and brachialis augment in size as the elbow is approached, and in amputating lower down inflammatory engorgements of the stump, deep abscesses, and osteitis are common, although rarely seen in amputations in the upper thirds. Three-fourths of the survivors are found among those amputated at the insertion of the deltoid, and though we made numerous amputations in the lower third, we found few invalids with this mutilation." I think the eminent professor is in error regarding the circumference of the arm. In fifty measurements of the arm of men employed in the War Department, I found the mean circumference at the deltoid depression = 9.9 inches,

while the graver cases were reserved for amputation; whereas, in the upper thirds, the gravest cases were treated by disarticulation at the shoulder, and the mortality of amputations in the continuity was proportionally reduced. But this explanation, and the further suggestion that the greater anatomical complexity of the tissues divided near the elbow admit a greater risk of septicæmic infection and consecutive hæmorrhage, are alike inadequate. Nor is the difficulty solved by an analysis of the causes of death in the individual cases of the several groups. The various immediate causes of fatality were in very nearly the same proportion in the lower as in the upper thirds. The question merits, and will doubtless receive, further investigation.

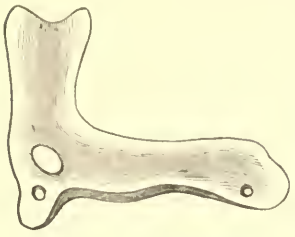

FIG. 582.—Lossen's extension splint.

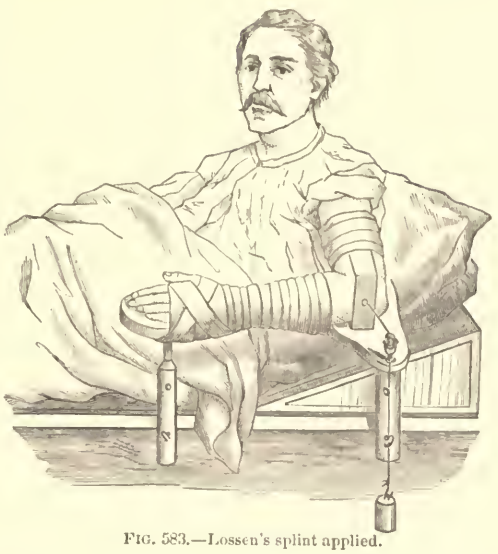

FIG. 583.—Lossen's splint applied.

There is room, in the space allotted to this Section, for a mere allusion to a remarkable instance of simple united shot fracture of the humerus,[1]—to an apparatus for extension[2] of shot fracture of the shaft (FIGS. 582, 583), with the remark that fractures of this bone requiring much extension are exceptional,—and to the fact of the frequent use of the tourniquet in shot wounds of the arm from dread of primary hæmorrhage. Besides the ordinary field tourniquets issued by the Army Medical Department, the more complex compressors devised by Drs. Lambert and A. B. Mott[3] were supplied to some of the troops. Some further observations on amputations of the arm,[4] bearing more especially on diseases of arm-stumps, must be reserved.

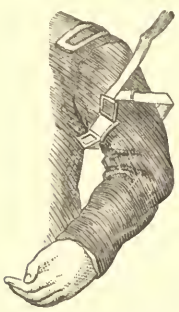

FIG. 584.—Tourniquet of Lee and Lambert applied to the brachial artery.

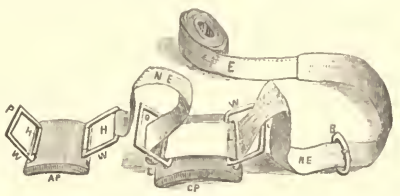

FIG. 585.—Lee and Lambert's tourniquet. AP, arterial pad; CP, counteracting pad; NE, inelastic band; E, elastic band; W W W W, wire wings hinged at H H; B, buckle. *Spec.* 2292(3).

over the most prominent part of the middle of the flexed arm = 9.7 inches, and at the point of section in amputations near the elbow = 8.7 inches. It seems more probable that the disposition of the aponeuroses, and of the veins and absorbents, may account for the greater liability to inflammatory engorgements in the section in the lower third. I have carefully analysed the causes of death in the three groups, and do not find a greater proportionate frequency of secondary hæmorrhage in the lower third amputations, and no marked predominance in the complications of gangrene, osteomyelitis, and pyæmia.

[1] In treating of simple shot fracture of the humerus, on p. 815, I omitted to mention a specimen in the museum of the New York Hospital, *Spec.* I, 103, of a united oblique fracture of the humerus, taken from a soldier wounded in the Mexican war, September, 1847. Dr. J. O. STONE, the donor, states that a cannon ball passed between the patient's arm and thorax, and broke the humerus without abrading the skin. Union took place, but there was complete paralysis, and the limb was successfully exarticulated at the shoulder, at the patient's request (RAY'S *Cat. Path. Cab. N. Y. Hosp.*, 1860, p. 69).

[2] Professor H. LOSSEN, of Heidelberg (*Kriegschir. Erf.*, in *Deutsche Zeitschrift für Chir.*, 1873, B. II, S. 56), describes this appliance as used advantageously in the hospitals at Manheim and Karlsruhe during the late Franco-German War, a judgment corroborated by Professor BILLROTH. The application of the lightly padded wooden angular splint is sufficiently explained by the drawing.

[3] The description of Dr. MOTT'S tourniquet is contained in a paper by his distinguished father, VALENTINE MOTT, *On Hæmorrhage from Wounds*, New York, 1863. It was favorably considered by Surgeon-General HAMMOND, and placed in the Dunton field panniers. Dr. T. S. LAMBERT, of Peekskill, proposed the tourniquet illustrated in the wood-cuts (FIGS. 584, 585), in *A Description of the newly-invented elastic Tourniquet for the use of Armies*, etc., New York, 1862. This instrument, according to the editor of the *American Medical Times*, 1862, Vol. V, p. 40, was officially issued to Maine, Connecticut, and New Hampshire troops, and it was actually urged that every soldier should carry one. The remarks made at p. 39 of *Circular* 6, S. G. O., 1865, are fully justified by further investigation. Serious primary hæmorrhage from shot wounds of the extremities is exceedingly rare.

[4] The first detailed instance of an amputation in the continuity of the arm for shot injury that I am able to find on record, is related by VALLERIOLA (*Observationum medicinalium Libri sex*, Lugduni, 1606, p. 301): On September 17, 1562, in a battle between the Huguenots and Papists, near the Cistercian city (Citeaux), a servant man received a wound from a brass blunderbuss, between the ulna and humerus, and his arm fell into a gangrene. Receiving no succor from the surgeon of the army, he went to Areleta (Arles), where VALLERIOLA saw him, with the arm sphacelated "cum fetore mirabili, ingredine, mollitie, frigidateque summa," and called a council of surgeons, and, "acting on the precept that GALEN gives from THUCYDIDES, that where there is but one way of salvation the most dangerous and doubtful remedies may be used," it was resolved to cut the limb, "and the man Jacobus recovered in a month, and we returned thanks to God."

I will conclude this Section by a comparative numerical statement of the results of shot fractures of the arm under different modes of treatment on sundry occasions:

Section V.

WOUNDS AND INJURIES OF THE ELBOW JOINT.

Reserving for future consideration the reported cases of sprains, contusions, simple and compound luxations and fractures resulting from other causes than shot injury, there remain, for present consideration, a few instances of bayonet and sabre wounds of the elbow joint,[1] many examples of shot injury, and a considerable number of operations involving the articulation. As usual, in treating of war injuries of the extremities the shot fractures will form the main subject of discussion, and, after glancing briefly at the punctured and incised wounds, and the periarticular shot wounds, the shot fractures will be examined in detail, according to their treatment by expectation, excision, or amputation, the materials for the history of the last category having been, to a large extent, collated in the preceding Section. A small group of exarticulations at the elbow, or amputations in the contiguity for injuries of the forearm, will also be comprised in this Section.

Punctured and Incised Wounds.—The few reported examples of such injuries were received in action, and were inflicted by the sword or bayonet.

Bayonet Wounds of the Elbow.—Three cases were reported as stabs penetrating the elbow joint; but it appears almost incredible that in either of them the articulation could have been really opened with such slight inflammatory reaction:

Cases 1731–1733.—Surgeon H. Wardner, U. S. V., reports that Sergeant G. Salz, Co. B, 9th Illinois, "received a severe bayonet wound directly over the external condyloid ridge, at Corinth, Mississippi, October 3, 1862. The wounded man was sent to Mound City Hospital on the following day. Simple cerate dressing was applied, and the wound healed kindly; the sergeant was returned to duty December 29, 1862.——Surgeon Isaac Scott, 9th West Virginia, reports that "Private C. Upson, Co. C, 14th Connecticut, received a bayonet wound of the elbow, at Chancellorsville, May 3, 1863. He was treated at regimental hospital near Potomac Creek, and also at the Second Corps general hospital." Surgeon F. A. Dudley, 14th Connecticut, reported that the patient returned to duty three days afterward. The Adjutant-General of Connecticut reports (*Report* of 1865) that the soldier subsequently died in the Andersonville prison.——Later information respecting the case of Private Welcome David (recorded as Case 1230, on p. 436 of this volume, and erroneously entered "D. Welcome") indicates, if the nature of the injury is correctly reported, a very remarkable recovery. It will be remembered that the case was regarded as a flesh wound, with lesion of the brachial artery, which was successfully secured by double ligatures. The captain of the company, however, testifies that "the bayonet ran through the elbow joint." Examiner Joseph Robbins, of Quincy, Illinois, certifies that there was "a bayonet wound of the right elbow joint. The bayonet penetrated the joint and passed between the radius and ulna, causing partial dislocation of the head of the radius, which still exists. There is partial anchylosis of the elbow, and the arm cannot be fully extended; pronation and supination are impossible, and the muscles of the arm and forearm are atrophied." Examiner J. W. Trader, of Sedalia, certifies, February 21, 1873: "The joint was injured, but no stiffness or anchylosis exists. There is some tenderness, owing no doubt to implication of the nerve. The brachial artery and median nerve were wounded." On January 15, 1874, this same Examiner reported that "rotation of the arm is perfect, and the joint free and mobile. Some muscular weakness." This soldier was pensioned and paid to March 4, 1875.

[1] Elbow: Anglo-Saxon, *Elboga;* German, *Elbogen;* Ital., *Gomito;* Fr., *Coude;* Sp., *El codo.* The region of the elbow is situated at the angular union of the arm with the forearm, and contains the humero-cubital articulation, and the tissues near it. (*J. Hart*, in *Cyclop. of Anat. and Phys.*, 1839, Vol. II, p. 62): "It may be arbitrarily defined as limited above by a circular line a finger's breadth above the inner condyle, and inferiorly, by a similar line, two fingers' breadth, below that process. Its greatest extent is in the transverse direction, and it forms an angle salient posteriorly, and retiring in front, which cannot be effaced even in the utmost extension of the forearm." Ἀγκών, a bend, or ἀγκάλη, the bend of the elbow, were the terms used in referring to this region by the Greeks.

Sabre Wounds of the Elbow.—Six instances are reported under this rubric.[1] It is possible that the joint may have been directly implicated in two of the cases; but the meagre evidence renders it most probable they were all six periarticular wounds. Three of the six patients were pensioned:

CASES 1734–1739.—Surgeon B. A. Vanderkieft reported that "Private P. A. Carlin, Co. F, 1st New York Mounted Rifles, was wounded at a skirmish at Scott's Mills, May 17, 1863, by a sabre thrust in the left arm, the point of the weapon entering below and within the olecranon process; entered Annapolis Hospital May 25th, and was returned to duty June 13, 1863." This soldier was discharged August 31, 1864, to re-enlist as a veteran, and deserted August 17, 1865, at Charlottesville. He applied for a pension, and the Brooklyn Examining Board (McCollum, Leighton, and Atwood) recommended his claim, May 6, 1874, stating that he had "received a sabre thrust on the left elbow joint. The cicatrix is an inch and a half long and over the external condyle. Prolonged exertion of the joint is attended with pain." The claim was disallowed until the charge of desertion was disproved.——Private G. Townsend, Co. A, 6th Michigan Cavalry, aged 28 years, is recorded on the casualty lists from Gettysburg, by Assistant Surgeon E. J. Marsh, U. S. A., as having received, July 2, 1863, a sabre cut on the forehead and a severe wound in the left elbow. He was sent to Satterlee Hospital, registered as a case of "sabre wound of the frontal region and left elbow," and returned to duty September 23, 1863. He was discharged June 21, 1865, and applied for pension. Examiner W. E. Dockey, of Michigan, certifies, April 21, 1875, that the cicatrix from the sabre wound of the head, "extending upward in a straight line about an inch above the left orbit, occasions no inconvenience. The wound of the left elbow was received in an effort to ward off a blow aimed at the head, the sabre striking across and about half an inch above the external condyle, injuring the nerve in its passage around the condyle. The cicatrix is about three-fourths of an inch long by one quarter of an inch in breadth, tender, but not firm. There is no difference in the size of the arm. There is loss of sensation on the ulnar side of forearm and hand, both on the dorsal and palmar aspects. There is no loss of motion. He claims to suffer from cold."——Surgeon W. W. Bowlby, 3d New Jersey Cavalry, reports that Private D. W. Cherrington, Co. C, 2d West Virginia Cavalry, "received, at Five Forks, April 1, 1865, a sabre wound of the right elbow." Assistant Surgeon C. A. McCall, U. S. A., reported this soldier's admission to the depot hospital of the Cavalry Corps April 3d, and return to duty April 27, 1865. Not a pensioner.——Private A. Hager, Co. C, 105th Pennsylvania, was wounded and captured at the engagement on the Weldon Railroad, October 27, 1864. Surgeon E. H. Smith, P. A. C. S., recorded his admission into Chimborazo (Confederate) Hospital, Richmond, November 3, 1864, and return to quarters, January 11, 1865. He was exchanged, and discharged from service May 29, 1865. Not a pensioner.——Private A. Dubrieul, Co. K, 1st New York, was wounded at Antietam, September 17, 1862. Surgeon J. H. Robinson, U. S. V., reported his admission to the Patent Office Hospital, December 24, 1862, "with anchylosis of the right elbow, resulting from a sabre cut," and the soldier's discharge from service January 15, 1863. Not a pensioner.——The case of Private J. T. Reed, Co. C, 1st Vermont Cavalry, has already been detailed on page 21 of the *First Surgical Volume*, and it remains only to add the report of Examiner J. Nichols, of Washington, who certifies, December 28, 1864: "Severe sabre cut across the left elbow joint, fracturing the olecranon process, and inflicting a serious flesh wound and severing tendons of forearm. The elbow joint is anchylosed and entirely useless. Also received a severe cut on the head, fracturing the right parietal bone and depressing the inner table. Several pieces of bone have been removed, and dizziness and pain, almost always present, has resulted." The subsequent examiners report substantially the same. The pensioner was paid September 4, 1875.

Punctured and incised wounds of the elbow may usually be treated hopefully on the

[1] Sabre wounds of the joints are so infrequent that the following examples are of interest: BILGUER (J. U.) (*Chirurgische Wahrnehmungen*, * *), who has collected many surgical cases reported by various surgeons at the Prussian field hospitals during the Seven Years' War, 1756–1763, details five cases of sword wounds of the elbow joint. CASE 14 (p. 426): Hussar Kollmar, of von Lau's Escadron; sabre wound through the olecranon into the articulation, June 2, 1762; fever, vomiting, copious suppuration; sinus; free incision, removal of numerous fragments of the posterior surface of the humerus; recovery in six months. Reported by Chief Surgeon BRAUN.—CASE 15 (p. 430): Lieut. von Prittwitz, sword wound through elbow joint; olecranon nearly split; joint opened; June 15, 1762, suppuration; free incision; removal of splinters; recovery in three months; anchylosis of elbow joint; partial anchylosis of shoulder joint, which gradually disappeared. Reported by Staff-Surgeon HENRICI.—CASE 16 (p. 434): Uhlan Woitgewitsch; sabre wound of elbow, extending obliquely across the joint; olecranon nearly cut away; wound gaping; recovery in five months, with complete anchylosis of joint. Reported by Surgeon HORLACHER.—CASE 17 (p. 436): Corporal von Fangerow, of Forcade's regiment, at the battle of Hoch-Kiirhen, October 14, 1758, while protecting his head with his uplifted arm against the attacks of a cuirassier, received a sword wound of the right elbow, which nearly severed the forearm; deep incisions, removal of many bone splinters; healthy suppuration established; recovery in five months. Reported by Staff-Surgeon BEYER.—CASE 18 (p. 440): A captured French dragoon, Birron, had been cut across the right elbow at the battle of Rossbach, November 5, 1757; the wound had been sewed up; Staff-Surgeon BEYER cut the sutures, enlarged the wound, and removed splinters; recovery in a short time, with tolerable use of the elbow. RAVATON (*Chirurgie d'Armée*, Paris, 1768, p. 613, OBS. XXV) gives the case of a dragoon of the Beaufremont regiment, whose left olecranon was severed by a sword cut and hung by a flap of skin. The parts were replaced, and maintained in apposition by compresses dipped in balsamic emulsions, and frequently wetted by vulnerary lotions. The limb was kept at an obtuse angle on an anterior splint. The patient recovered, with moderate stiffness of the elbow. RAVATON remarks that the regeneration of the integuments of the elbow is very slow, the aponeurosis and ligaments opposing almost insurmountable obstacles to reunion, and, in the latter stages, a whitish gelatinous discharge appearing that is arrested only with great difficulty. Irritating dressings are likely to induce caries of the condyles of the humerus, etc. LARREY (D. J.) (*Mém. de chir. mil. et camp.*, Paris, 1812, T. II, p. 257) observes: "Toutes les fois que'une articulation ginglimoïde est ouverte et altérée profondément par la cause vulnérante, il importe d'examiner avec soin cette blessure, pour résoudre la question de savoir s'il n'est pas plus avantageux (comme je le pense) de couper le membre, que de laisser le malade livré à un danger certain," and on page 256 cites the case of Gabriel Sauvages, a chasseur, who received a sabre cut in the left elbow, dividing the articulating portion deeply and extensively. It had been attempted to bring the lips of the wound into exact apposition; inflammation had already set in, and in twenty-four hours gangrene supervened. M. LARREY amputated the arm, and the patient left the hospital in forty days, perfectly cured. In the case of d'Aout, a captain of mamelukes, the skin, the olecranon, a part of the articulating surface of the humerus, the contiguous ligaments, and some branches of the recurrent arteries were divided. M. LARREY observes: "Malgré la gravité de la plaie, je conçus l'espoir de conserver le bras, je ne voulus point la reunir par première intention, l'expérience m'ayant appris que les réunions trop exactes pour les plaies des articulations sont plus pernicieuses qu'utiles, a raison de la pression très-forte que les bandages unissans exercent sur les parties inégalement coupées ou déchirées. L'inflammation se déclare, marche avec l'appareil qui l'accompagne, et il est difficile d'en prevoir les suites." The captain recovered with the principal motions of the arm preserved.

expectant conservative plan, reserving the remedy of secondary excision until rendered imperative by inflammatory disorganization of the joint; but temporization sometimes involves grave and even fatal consequences.[1]

SHOT WOUNDS.—Instances were reported of periarticular shot wounds, with consecutive involvement of the joint, and of shot penetrations of the articulation without fracture. Illustrations of these injuries will be met in studying the expectant and operative treatment of shot injuries of the elbow. At present, our attention will be particularly directed to the recorded examples of shot wounds involving primarily the bones composing the humero-cubital articulation. These are classified in the subjoined table:

TABLE CV.

Tabular Statement of Two Thousand Six Hundred and Seventy-eight Shot Fractures of the Bones of the Elbow Joint.

MODE OF TREATMENT.	CASES.	DUTY.	DISCHARGED.	UNDETERMINED.	DIED.	MORTALITY OF DETERMINED CASES.
1. Treated by Expectation	938	285	543	14	96	10.3
2. Followed by Excision of the Elbow Joint	529	80	318	16	115	22.4
3. Followed by Excision of the Elbow Joint and subsequent Amputation of the Arm.	64	4	35	.....	25	39.0
4. Followed by Amputation at the Elbow Joint	6	.....	5	.....	1	16.6
5. Followed by Amputation of the Arm	1,124	109	738	5	272	24.3
6. Followed by Amputation at the Shoulder	17	.....	13	.....	4	23.5
Aggregates	2,678	478	1,652	35	513	19.4

Thus, of the twenty-six hundred and seventy-eight instances of shot fractures interesting one or more of the bones of the elbow, nine hundred and thirty-eight were treated throughout on the expectant conservative plan, five hundred and ninety-three by excision, and eleven hundred and forty-seven by amputation. The class embraces injuries of great variety,—comminutions or perforations of the shaft of the humerus, with fissures extending into the joint; fractures of the ulna or of the radius, or of both, communicating with the joint; penetrations of the joint by small missiles with slight lesion of one or more of the articular surfaces and lodgement of the missile; grazing shots implicating one or other of the processes; perforations in all directions with more or less destruction of tissue; and comminutions by large projectiles; and each of these varieties was further complicated by

MALLE (P) (*Clin. chir. de l'hôpital mil. d'instruction de Strasbourg*, Paris, 1838, p. 620) informs us that "a soldier of the 1st Artillery received, on February 15, 1835, in the bent elbow joint, a sabre cut, which detached the olecranon. The wound was exceedingly painful. M. BÉGIN secured the arm in a nearly extended position; whenever the bandage was removed, the arm was flexed a little farther. The soldier recovered in fifty days; the movements of the arm were preserved. MACLEOD (G. H. B.) (*Notes on the Surgery of the War in the Crimea*, 1858, p. 327) reports: "A dragoon was cut across the elbow of his sword arm by a Russian horseman, at the heavy cavalry charge at Balaclava (October 25, 1854). The olecranon was completely detached and the joint opened. The wound was immediately closed, the arm placed in an extended position, and cold employed to allay inflammation. Little more was done, and the divided surfaces quickly adhered, and an arm remained which, although not so free in its motions at that joint as it was formerly, was yet most useful."

[1] MICHAELIS (*Nachrichten aus New York*, in RICHTER'S *Chir. Bibliothek*, Göttingen, 1782, B. VI, p. 727): A soldier run a large nail into the elbow joint; little blood but a great deal of yellow fluid escaped; enormous swelling ensued; counter-openings were made at the hand, when a large quantity of pus escaped; small pieces of loose carious bone were removed from the elbow joint by enlarging the wound. The patient recovered in seven weeks, with nearly complete anchylosis of the joint. LANGENBECK (B. v.) (*Chirurgische Beobachtungen aus dem Kriege*, 1874, p. 158): A carpenter, 54 years of age, received, on February 22, 1857, in the streets of Berlin, a punctured wound of the left elbow joint, which bled very freely. When admitted to the clinic, blood and synovia escaped. The arm was secured at right angle and ice applied. February 27, the arm was swollen and gangrene developed at the wound; March 6, resection of elbow joint; March 9 to 16, healthy suppuration and granulation; March 30, pyæmic chills; April 11, death. Autopsy: Pyæmic foci in the lungs and in the connective tissue of the anterior wall of the bladder; pus in the left shoulder joint. The resected humerus necrosed for two and a half inches, the medulla infiltrated with ichorous sanies. HERRMANN (A. G.) (*Compendium der Kriegs-Chirurgie*, Wien, 1870, S. 255): "Punctured and incised wounds of the elbow joint may be treated on the expectant-conservative plan, or by secondary resection when extensive suppuration of joint supervenes."

the extent of injury to the synovial membrane, the cartilages, ligaments, vessels, nerves, and other soft parts with which they were attended. In the discussion of this series of shot wounds of the elbow under the three heads of cases treated by expectation, excision, and amputation, there will be occasion to refer to each of these different forms of injury.

Shot Wounds of the Elbow treated on the Expectant Plan.—There were nine hundred and thirty-eight cases of shot injury of the elbow treated throughout on the expectant plan,[1] at least two hundred and fifty treated by temporization with ulterior recourse to intermediary or secondary excision, and a large number, undetermined with strict exactness, by consecutive amputation. Several examples of the first group will be cited, commencing with such as recovered with conservation of the functions of the joint:

CASE 1740.—First Lieutenant E. A. Ellsworth, Co. D, 11th Infantry, aged 24 years, was wounded at Bethesda Church, June 1, 1864. Two days afterward he reached the Fifth Corps Hospital at White House, and, on June 7th, he entered Harewood Hospital, Washington. Surgeon D. W. Bliss, U. S. V., reported: "Gunshot wound of right arm. Patient transferred to private residence on June 13th." The missile, represented in the annexed cut (FIG. 586), is a small triangular fragment of a shell weighing two hundred and five grains troy; remarkable for having furnished lustre to a porcelain bulb though of cast iron. It was contributed to the Museum by Assistant Surgeon J. S. Smith, U. S. A., who reported: "The missile struck the ulna of the right arm about one and a half inches from the elbow joint, fracturing the bone transversely at the point of contact and rending it into long splinters in its length. The presence of the missile was revealed by the Nélaton probe about midway of the ulna, between the long spiculæ." In a report of observations by Assistant Surgeon J. S. Billings, U. S. A., to the Medical Director of the Army of the Potomac, mention is made of this case as follows: "Lieutenant Ellsworth was wounded by a minié ball, which passed through the upper and outer portion of the right ulna, the fracture extending into the elbow joint. The smaller fragments and spiculæ were removed by Assistant Surgeon J. S. Smith, U. S. A., and two large and firmly attached fragments, one joined to the upper, the other to the lower fractured end, were left *in situ*. Simple cold-water dressings were applied. This officer went to Washington, and was treated by Surgeon B. Norris, U. S. A. Two months afterward the wound had almost entirely healed, motion was good in the joint, although somewhat limited, and the deformity of the arm was slight. Only three small spiculæ of bone came away." Lieutenant Ellsworth resigned his commission on December 18, 1866, and was pensioned. Examiner W. W. Potter, April 19, 1869, certified: "Fracture of right ulna near elbow joint, caused by a shell. * * * The head of the radius appears displaced and the limb is deformed. The muscles are atrophied; extension cannot be completely made; pronation and supination are imperfect; strength of limb destroyed for any purpose of labor." The pensioner was paid on March 4, 1875.

FIG. 586.—Shell fragment extracted from a wound of the elbow. *Spec.* 4280.

CASE 1741.—Brigadier-General John W. Geary, U. S. V., was wounded at the engagement at Cedar Mountain, August 9, 1862. He was struck in the evening in the left foot, and afterward received a more severe wound in the left elbow, "but remained on the field until nine o'clock, when he was compelled to retire from exhaustion produced by pain and loss of blood." (BATES, in *Hist. of Penna. Vols.*, 1869, Vol. I, p. 427.) His wounds were dressed at the field hospital of the 2d division, Second Corps, established by Surgeon A. Ball, 5th Ohio, and he was sent to Culpeper and thence to Washington. He was attended in quarters by Surgeons M. Clymer, B. A. Vanderkieft, U. S. V., and Dr. David Ahl. It was found that a conoidal musket ball had shattered the left olecranon and outer condyle, and had flattened itself against the latter. There had been considerable bleeding, and the joint was already swollen and tender. The battered projectile and some bone splinters were extracted, and the limb was put up in a felt trough or angular splint, a large fenestrum being cut out opposite the wound, and kept at rest at an angle of 130°. There was very considerable inflammatory reaction and copious suppuration; but the inflammation was kept within bounds and there was little destructive action in the tissues about the joint. At the end of five weeks, it was practicable to commence passive motion, cautiously, and by September 25th the General was able to rejoin the army, "with his arm still in a bandage" (BATES, *op. cit.*, p. 428), and took command of the 2d division, Twelfth Corps. He was again wounded at Chancellorsville; but served to the end of the war with very tolerable motion of the elbow. He was subsequently elected Governor of Pennsylvania, and died February 9, 1873, aged 53 years.

---

[1] PARÉ (*Œuvres Complètes, éd.* MALGAIGNE, 1840, T. II, p. 168, IX Livre, Chap. XIV) relates two instances of shot wounds of the elbow that recovered without operative interference—that of the Comte de Mansfelt and that of Bassompierre, colonel of horse, both wounded at the battle of Moncontour, 1569. PARÉ observes that neither of these noble lords was able to flex or extend the arm after recovery, and that in the case of Comte de Mansfelt more than sixty pieces of bone were removed during the cure. Such examples are very rare in the early records. RICHARD WISEMAN, Sergeant Surgeon to Charles II, seems to have regarded amputation as indispensable in shot fractures of the elbow. He tells us (*Severall Chirurgicall Treatises*, London, 1676, p. 420) that a Scottish soldier was brought to him at the battle of Worcester, shot with a musket bullet into the elbow joint, which fractured not only the ends of the radius and ulna, but likewise that of the *adjutorium*. WISEMAN proposed to cut off the arm, and encouraged the soldier to endure it. "In answer thereto, he only cried: 'Give me drink and I will die!' They did give him drink, and he made good his promise, and died soon after; yet had no other wound than that." The urgent thirst and speedy dissolution suggest that he perished from hæmorrhage. MUNNIKS (*Praxis Chirurgica*, Amsterdam, 1715, p. 324, Lib. II, Cap. XXIII), though he gives no case, refers to the liability of anchylosis after wounds of the elbow: "Sin Cubiti articulo inflictum sit vulnus, brachium nequè extensum servandum, nequè inflexum nimis; illa enim figura contractionem, sanato vulnere, solet impedire; hæc liberam extensionem; quocircà mediâ collocandum figurâ, quæ angulum obtusum refert." BORDENAVE (*Mem. de l'Acad. de Chir.*, 1753, T. II, p. 523) relates the case of an Irish soldier, wounded at Ypres by a ball which carried away the aponeurosis of the extensors of the forearm, the olecranon, and a portion of the external condyles. After violent inflammation and exfoliation, the patient recovered in three months, under the care of PLANQUE. BOUCHER (*Obs. sur. des playes d'armes à feu*, in *Mem. de l'Acad. de Chir.*, 1753, pp. 292, 302) records four cases of shot fracture of the elbow resulting favorably, after Fontenoi and other engagements of that period.

Another instance of recovery after shot fracture of the head of the radius, the ulna, and outer condyle of the humerus, with good motion of the elbow, has been published by Acting Assistant Surgeon F. H. Brown.[1] Mr. E. N. B. Smith, of Buffalo, has also printed, in July, 1864, an account[2] of a shot comminution of the olecranon and epitrochlea in a soldier wounded at the Wilderness in the previous May, who was rapidly recovering with "the motions of the joint retained in a remarkable degree;" but the report of the pension examiners does not confirm the favorable prognosis of mobility of the elbow. Eight other instances are found on the records of recovery after shot penetration of the elbow without much loss of motion; but whenever it has been practicable to trace the ulterior histories of these discharged men it appeared that they had stiff or diseased joints. Assistant Surgeon D. C. Peters, U. S. A., states[3] that he treated twelve cases of shot injury of the elbow joint on the expectant conservative plan, with extraordinary success; but the examples I have given are all that have come to my knowledge of recovery with motion. On the other hand, the recoveries with anchylosis in a favorable position are numerous.

CASE 1742.—Lieutenant-Colonel Isaac J. Wistar, 71st Pennsylvania, was wounded at Ball's Bluff, October 21, 1861. In his *History of Pennsylvania Volunteers*, 1870, Vol. III, page 790, Mr. Samuel P. Bates reports that: "Lieutenant-Colonel Wistar was twice severely wounded, but kept his place until he was completely disabled by a third wound." The first two injuries were shot flesh wounds of the thigh and of the neck, the third a shot fracture of the right elbow. The case is referred to by Surgeon A. B. Crosby, U. S. V. (*Appendix to First Part Med. and Surg. Hist. of the War*, p. 11), in his report of the wounded at Ball's Bluff, and by Surgeon J. A. Lidell, in the same volume of documents, p. 13. There was little inflammatory reaction for a fortnight, but grave trouble ensued. However, the patient recovered with an anchylosed joint, and, in August, 1862, returned to duty as colonel. At Antietam he received a shot perforation of the left arm, near the elbow, but not implicating the bone. (See Bates, *l. c.*, p. 794.) Promoted to be brigadier-general, November 29, 1862, this officer served until honorably mustered out, September 15, 1864. In November, 1875, Dr. George C. Harlan, of Philadelphia, had the kindness to make the following notes of the injury to the right elbow: "The ball seems to have shattered the external condyle of the right humerus and the head of the radius, and to have chipped the olecranon in passing out. There was no resection, but the wound was opened about three weeks after the injury and some pieces of bone were extracted. *Present condition:* The wounds of entrance and of exit are united by a broad cicatrix. The elbow is firmly anchylosed at a right angle. The forearm is well developed. The hand is in excellent position and its functions are perfect except that slight limitation of flexion interferes with the handling of small objects. The 'other elbow' is in good condition, never having received any injury, but there is an adherent cicatrix on the inner side of the arm, at about its middle, and some numbness of the little, ring, and middle fingers of the left hand. There was occasional pain in the right elbow for two years, after which it became constant, and was at times very intense. There were no signs of inflammatory action in the joint—the pain was of a neuralgic character, and extended over the whole arm and forearm. This lasted about two years, when it gradually subsided, and, of late, the General has suffered only occasionally and slightly." This officer's name is borne on the Pension List as last paid June 4, 1875.

[1] BROWN (F. H.) (*Cases illustrating conservative surgery*, in *Boston Med. and Surgical Journal*, 1864, Vol. LXX, p. 9): "Ball entered outer and dorsal aspect of right arm three inches below olecranon; the ball there split, one portion passing up through the outer condyle of the humerus and lower part of the shaft of the bone, and thence out on the outer and posterior aspect of the arm, three inches below the elbow; the second portion passed through the radius and ulna at a right angle to the axes of the bones, and lodged. This portion was removed by incision at a subsequent period. In addition, the humerus was fractured transversely, just above the exit wound of the first portion of the ball, either by a fall or by concussion. In this case, there was fracture of the humerus, comminution of the lower end of the same bone, injury to the joint, comminuted fracture of the radius and ulna, and two ball tracks of perhaps six and ten inches, respectively." The arm was put up in felt splints, and the fractures united well. The report concludes: "At the earliest possible day flexion and extension and pronation and supination were induced. When last heard from, three and a half months after the injury, he had entirely recovered, the only trouble being that, in extending the arm, it lacked an inch or two of being straight. This soldier was transferred to Buttonwood, to Mower, and to Convalescent Hospital, and mustered out with his regiment June 18, 1863. Not an applicant for pension.

[2] SMITH (E. N. B.) (*Buffalo Med. and Surg. Jour.*, 1864, Vol. III, p. 460): Private J. Brunner, Co. B, 49th New York, aged 39 years, was wounded at the Wilderness, May 5, 1864, and was sent to Emory Hospital, at Washington, May 11th, and was furloughed May 16th. He went to Buffalo, and Mr. SMITH states that Dr. MINER laid open the wound, and found that the ball had entered the forearm about an inch and a half below the olecranon, and had broken off the process and shattered the ulna for three inches below the point of entrance, and fractured the inner condyle of the humerus, not touching the radius. The ball and pieces of bone were removed, and the wound cleansed and drawn together. This patient was readmitted to Emory Hospital, September 10th, and discharged December 3, 1864, "for paralysis of left arm and anchylosis of left elbow, caused by gunshot wound." Examiner Tormis, of Buffalo, certified, September 17, 1866: "Ball entered left elbow near olecranon, passed into joint, and was removed by incision; exfoliation ensued, and the elbow joint is now completely anchylosed in nearly an extended position." The Buffalo Examining Board reported, September 4, 1873: "Loss of pronation and supination of hand; flexion and extension almost lost; unable to extend and flex fingers." The pensioner was paid June 4, 1875.

[3] PETERS (D. C.) (*Gunshot Wounds of Joints*, in *Am. Med. Times*, 1863, Vol. VII, p. 156) tabulates six cases of shot injury of the right and six of the left elbow, treated at Jarvis Hospital from June 20, 1862, to October 1, 1863. Of the twelve patients, one was cured and returned to duty, seven were transferred to other hospitals, three were remaining under treatment, and one had died. Dr. PETERS observes: "The gunshot wounds of the elbow joint enumerated in the table, we treated by resting the limb bent at a right angle on a grooved tin splint which had been previously well padded with tow. They were retained in this position by loose bandages; the wounds were kept clean, and the patient, as soon as able, was made to exercise in the open air, and attention was paid to passive motion. The diet of these patients must be generous, and malt liquors are to be ordered them to support their strength. The diet of a soldier in the field is substantial, but it is not sufficiently mixed to be healthy—that is, he does not have the opportunity to obtain his customary amount of vegetables; and it has been found in general hospitals, where the men are supplied with these articles, that their condition is much improved, and, indeed, in most chronic complaints a most wonderful change is worked under their use."

A number of examples of the results of expectant measures after shot penetration of the elbow joint will be detailed, and, for comparison, some results will be cited of analogous cases[1] in other campaigns,[2] both remote and recent.[3]

CASE 1743.—Private E. T. Parker, Co. E, 2d New Hampshire, aged 21 years, was wounded at Gettysburg, July 2, 1863, and admitted to the field hospital of the 2d division, Third Corps, where Surgeon C. K. Irwin, 72d New York, recorded: "Wound of right arm and left thigh." On July 13th, the wounded man entered West's Buildings Hospital, Baltimore, and on November 2d he was transferred to Baxter Hospital, Burlington. Surgeon G. Rex, U. S. V., and Assistant Surgeon S. W. Thayer, U. S. V., reported "the favorable progress of a gunshot wound of right arm." This soldier was transferred to the Veteran Reserve Corps March 8, 1864, and discharged from service June 9, 1864. He subsequently re-enlisted, and was placed on duty as messenger at the Army Medical Museum, where he is still employed in the clerical force of the Surgeon General's Office. According to his statement, he was wounded in both thighs and in the scalp, in addition to receiving a gunshot fracture of the right elbow, the ball entering the joint below the external condyle of the humerus, passing through the ulna, and emerging about one inch from the end of the olecranon. About October 1, 1863, twenty-nine fragments of bone were removed, varying from one-fourth to one and a half inches in length, the two largest being nearly one-quarter of an inch wide. A photograph was taken of the pensioner at the Museum in 1871, and is represented in the annexed cut (FIG. 587.) This pensioner was examined April 17, 1882, by Dr. J. O. Stanton, who certified: "Gunshot wound of right elbow; the ulna and radius seem to have been fractured. The forearm is partially flexed and the elbow joint anchylosed; is unable to rotate the forearm; slight atrophy; circulation poor in forearm and hand," etc. A plaster cast of the injured elbow in this case was taken and contributed to the Museum, about three years after the reception of the injury, by Hospital Stewart E. F. Schafhirt, U. S. A. It shows the joint in a semi-flexed position, with an irregular transverse cicatrix extending across the dorsal surface just below the articulation. (*Cat. Surg. Sect.*, 1866, p. 537, *Spec.* 4026.) In January, 1876, this case was examined by the writer. The cicatrix over the olecranon and external condyle was rather more conspicuous than represented in the cut. The joint was very firmly anchylosed, the forearm in pronation; the power of supination was entirely gone. There had been no traces of inflammation about the joint or of neuralgic pain for several years. The muscles of the forearm were well developed, and the functions of the hand perfect, the pensioner writing well.

FIG. 587.—Anchylosis after shot fracture of the olecranon and outer condyle. [From a photograph.]

Other cases were complicated with protracted suppuration and extended caries:

CASE 1744.—Private T. Hayes, 1st Kansas, aged 41 years, was wounded at Wilson's Creek, August 10, 1861, and sent to St. Louis on the 19th. Surgeon S. M. Horton, U. S. A., reported, September 17, 1862: "The wound was by a conical ball, which entered the outer and anterior side of upper portion of forearm three inches below the elbow joint, and escaped through the inner and posterior portion off the lower end of the arm one inch above the joint, fracturing the upper end of the radius, and fracturing and breaking off the internal condyle of the humerus. Violent inflammation set in soon after infliction of the wound. The soft parts have healed several times, but abscesses formed again and again around and near the joint. * * Several pieces of bone have been extracted, and now, after the lapse of thirteen months, the man is confined to his bed with a painful, diseased arm. The upper half of the surface of the forearm is erysipelatous, and pus of an unhealthy character exudes from openings near the joint every fourteen to twenty days." This soldier was discharged February 12, 1863, and pensioned. Examiner Cumminsky reported, July 27, 1866: "Anchylosis of right elbow joint, with forearm at a right angle, and partial paralysis of the fingers, rendering them useless in any kind of manual labor. Caries of the humerus and upper part of radius and ulna." Examiner Corson reported, September 29, 1873: "There has been disease of the humerus nearly to the shoulder joint, with discharge of bone. Arm is atrophied, with two inches shortening; hand and fingers distorted."

---

[1] BILGUER (J. U.) (*Chirurgische Wahrnehmungen*, Berlin, 1763, S. 407–482) details fourteen cases of recovery after shot fractures of the bones of the elbow joint, treated on the expectant conservative plan; but in one instance only (*Wahrnehmung* VI, S. 408) is it reported that some motion of the elbow joint remained. THOMPSON (J.) (*Report of Obs. after Waterloo*, 1816, p. 156) refers to several cases of shot wounds of the elbow joint in which recovery would probably take place by anchylosis, and to one in which the ball was lodged in the joint without much inflammation. PERCY and LARREY appear to have been very skeptical as to the propriety of treating shot injuries of the elbow without operative interference. HENNEN and ALCOCK are silent on the subject. GUTHRIE (G. J.) (*A Treatise on Gunshot Wounds*, 2d ed., 1827, p. 521) recommends excision in cases of shot fractures of the bones of the elbow joint; but where the head of the radius or ulna alone is injured, it "will not require so severe an operation; the pieces of bone should be removed, and the efforts of nature carefully awaited."

[2] I find but few references to shot wounds of the elbow joint in the meagre surgical annals of the American Revolution and the War of 1812. NEALE (H. St. J.) (*Chirurgical Institutes*, London, 1865, p. 224) relates the case of Major Ferguson, wounded at Brandywine by a musket ball, which carried away the olecranon of the right elbow. This officer recovered after three months, and resumed active service, with a stiff joint. Dr. AMASA TROWBRIDGE, who was surgeon of the 21st U. S. Infantry during the engagements on the northern frontier in 1812, relates (*Lecture on Gunshot Wounds, at Willoughby University*, in *Boston Med. and Surg. Jour.*, 1838, Vol. XVIII, p. 342) that "Col. Aspinwall, at the battle of Chippewa, received a gunshot wound near the elbow joint. The ball pierced the capsules and condyles of the humerus, and yet he appeared to be but little affected by it. He remained on the field until the battle was ended, then immediately suffered amputation of his arm without much pain or disturbance."

[3] In the Schleswig-Holstein campaigns of 1848–'50, STROMEYER (L.) (*Maximen*, S. 756) tabulates three cases of shot fractures of the elbow recovering without operative interference, with stiff joints. In the Dano-Prussian War of 1864, Dr. LÖFFLER (*General-Bericht über den Gesundheitsdienst im Feldzuge gegen Dänemark*, 1864, S. 229) informs us that of forty-seven cases of shot fracture of the elbow, four were treated by amputation, forty by resection, and three by expectation. Of the latter group, two cases resulted fatally. Twelve of the resected and two of the amputated cases were fatal

The next case furnishes an example of fair recovery after shot fracture of the olecranon, the joint, though stiff, remaining exempt from disease:

CASE 1745.—Private A. Brown, Co. K, 13th New Jersey, aged 19 years, was wounded at Gettysburg, July 3, 1863, and admitted to the Twelfth Corps Hospital. Surgeon H. E. Goodman, 28th Pennsylvania, noted: "Gunshot wound of right elbow." On July 11th, the patient entered Mower Hospital, Philadelphia, where Surgeon J. Hopkinson, U. S. V., recorded the following history: "He was injured by a rifle ball in the right elbow joint, directly over the olecranon, causing a transverse wound extending down to the bone. On admission, the arm was painful and swollen; ordered poultice of linseed meal. July 13th, ordered cold-water dressings. July 21st, wound looking much the same; arm a good deal inflamed and painful; has a good deal of fever. Ordered sulphate of magnesia an ounce; also a prescription of liquor ammoniæ acetatis four ounces, and spiritus ætheris nitrici two ounces, given in tablespoonfuls every two hours. July 24th, discontinued fever mixture; the arm is kept enveloped in lint saturated with lead water and laudanum. July 27th, wound suppurating freely; inflammation much reduced; patient is on extra diet. The same treatment was continued to August 8th; wound healthy. August 9th, warm-water dressings applied; an abscess forming above the elbow. August 10th, abscess opened and a great quantity of pus discharged; emollient poultice applied. Patient anæmic; is on extra diet, with a bottle of porter per day and tonics, a prescription of sulphate of quinine eight grains, and pills of carbonate of iron twenty-four grains, with sufficient extract of gentian to make twelve pills, being given in doses of one pill every three hours; also an anodyne at bedtime. August 11th, improving; same treatment continued. August 12th, stimulating poultice applied to wound, and a solution of plumbi subacetatis mixed with tincture opii, to surrounding parts to obviate the inflammation; anodyne at bedtime. August 13th, 14th, and 15th, doing very well; treatment continued. August 16th and 17th, wound looks well; patient has diarrhœa; a dose of one-half ounce of castor oil and ten drops of tincture of opium prescribed. August 18th, 19th, and 20th, diarrhœa checked; wound in excellent condition; discharge much decreased; patient on extra diet. August 21st, a superficial abscess formed on elbow, was opened, and discharged a thin sanious pus; general health good. August 22d and 23d, continued treatment; doing well. August 24th to 31st, cold-water dressings applied; patient doing well, and still on extra diet, with a bottle of porter daily and tincture of sesquichloride of iron twenty drops thrice daily. September 1st, opened a small abscess, which discharged thin sanious pus; applied flaxseed poultice. September 2d to 10th, general treatment continued; doing well. September 11th to 18th, continued treatment. I think this patient will have a stiff joint. The wound is nearly healed; it is still a little tender upon pressure, and there is little or no motion. September 19th to October 7th, doing well; treatment continued. October 8th to 12th, the elbow joint is injured, but there is no complete anchylosis; the wound is nearly healed. October 13th to 20th, doing well; a small piece of bone came away; the wound looks better since, and is now doing very well. October 23d, doing well; wound nearly healed; dressed with simple cerate. October 27th to November 1st, doing well; treatment continued." On January 10, 1864, the patient was assigned to the Veteran Reserve Corps, to which organization he belonged until March 1, 1869, when he was transferred to the general service. Examiner J. O. Stanton, June 6, 1872, certified: "Gunshot wound of right arm at elbow joint, injuring the olecranon process. The elbow joint is partially flexed and anchylosed, and there is slight atrophy and some loss of power in the forearm." This pensioner has been on duty as messenger in the Surgeon General's Office since September 5, 1865, and is at present serving in that capacity. At the Army Medical Museum, a photograph of him, represented in the annexed cut (FIG. 588), was taken in 1875. The elbow then permitted no flexion or extension, but movements in pronation and supination were perfect, and the functions of the forearm and hand were unimpaired, and the joint was free from any inflammatory action.

FIG. 588.—Elbow anchylosed after shot injury. [From a photograph.]

In the next case, the ulna was more extensively fractured, and the functions of the forearm and hand were less perfectly restored:

CASE 1746.—Corporal W. Marshall, Co. F, 1st Pennsylvania Reserves, was wounded at South Mountain, September 14, 1862, and sent to Washington. After treatment in Ryland Chapel, he was admitted, December 5th, to Stanton Hospital. Surgeon J. A. Lidell, U. S. V., reported: "The patient received a gunshot wound of the left elbow joint. The forearm was partially bent upon the arm at the time of injury. The bullet entered the outside of the joint close to the ulna, and passed directly inward, splitting the ulna, passing through the articulation, and escaping on the inner side of the joint; thence continuing its course inward and grazing the antero-lateral part of his body. For about six weeks after he was hurt the wound at the elbow pained him a great deal, and discharged copiously. The joint has never swelled to a marked degree. No large bone splinters have been discharged. Some bone in the form of grit, as the patient calls it, has been discharged, but the quantity has not been large; he has been treated for the most part with the water dressing. The wound is now nearly closed; discharge trifling. Anchylosis has occurred; all motion of joint lost, including pronation and supination. There is now no pain, and but little soreness; the forearm is permanently flexed on the arm at an obtuse angle of about 120°. He has good motion of the fingers, hand, and wrist; the amount of atrophy is small. Discharged from the service on surgeon's certificate of disability. January 13, 1863, condition improving; excellent prospect of preserving a useful limb." Examiner P. R. Palm, of Allentown, Pennsylvania, May 4, 1872, certifies: "The joint is completely anchylosed, and the arm partly bent and considerably atrophied. Complains of want of strength in the limb, and cannot well grasp objects; says he has much pain in the whole arm." And May 6, 1874: "There is anchylosis of the joints of the left hand, partly." This pensioner was paid December 4, 1874.

In the following case, the elbow joint was opened by a ball, with but slight injury to the articular surfaces of the bones composing the elbow:

CASE 1747.—Private A. Parkess, Co. I, 16th Connecticut, aged 22 years, was wounded at Antietam, September 17, 1862, and was sent to Baltimore and entered Camden Street Hospital. Acting Assistant Surgeon E. G. Waters made the following special report: "Admitted September 25, 1862. Examination showed that a musket ball had entered the posterior aspect of the left forearm five inches below the elbow, passed upward and outward, emerging over the outer condyle of the humerus. The wounds were treated with water dressing. October 5th, it being evident that the elbow joint had been opened by the bullet, or so severely contused that violent inflammation had been set up, and fluctuation being apparent, the wound over the outer condyle was freely opened; a quantity of pus issued, and the finger passed into the cavity of the articulation. The extremity of the humerus was found already roughened through the ulceration or absorption of cartilage. Constitutional irritation was met by general treatment, and the wound dressed with aqueous infusion of opium. The forearm was maintained at a right angle and anchylosis secured in this position. A superficial abscess of the joint was subsequently opened. This youth, while under treatment for the above injury, had a mild attack of gastric fever, and subsequently of scarlet fever. During this last attack he was a good deal plagued with retention of urine, the catheter being daily required for his relief for a week or more. February 26th, cured and discharged the service, using his hand and arm at the time with great facility." Examiner S. G. Ridley, of Vernon, Connecticut, July 27, 1870, finds: "Perfect anchylosis of the left elbow joint; the forearm related to the arm at an angle of about 110°." * * "Unable to use the arm any in manual labor; the entire arm about two-thirds the size of the other arm; cannot reach any part of the head with any part of the hand when the head is erect, so he cannot use it in feeding himself." The Hartford Board (Drs. Brownell, Jarvis, and Fuller) reported, September 16, 1873: "Ball struck near the outer condyle and passed down to the middle of the forearm, and came out over the radius. Complete anchylosis at about a right angle. Forearm pronated and incapable of rotation." This pensioner was paid December 4, 1874.

The limb was often preserved when the articular surfaces were very badly fractured,[1] as in the following case, in which the humerus, radius, and ulna were involved:

CASE 1748.—Corporal O. G. Hess, Co. C, 8th Illinois Cavalry, was wounded at Beverly Ford, June 9, 1863, and was sent to St. Paul's Church Hospital, at Alexandria. Assistant Surgeon A. W. Tryon, 100th New York, reported: "Admitted June 11, 1863. Ball entered over the middle point of the upper aspect of the elbow joint, and, passing upward and backward, made its exit on the outer surface of the arm an inch above the joint, fracturing the humerus. General health good; bowels constipated. A mild cathartic was given, and the wound was constantly irrigated with ice water. June 20th, some fever; pulse 118; tongue a little coated. June 30th, arm is but little swollen; some small pieces of bone discharged; appetite good; pulse 92; bowels constipated. Compound cathartic pill given, cold-water dressings to wound, and one glass of porter daily. July 10th, arm is improving finely. July 15th, has an attack of diarrhœa; pulse 98; arm looks well; discharge is small. Astringents given. July 20th, diarrhœa checked; appetite good; is able to sit up, and can move the joint. July 24th, is able to walk about; upper opening of the wound entirely healed; discharge slight; pulse 84. July 26th, was up in the morning, feeling unusually well; at five in the afternoon was taken with a chill. July 27th, erysipelas appeared on the right arm—the swelling is considerable, redness extending six inches above and below the elbow; pulse 118; tongue coated light brown. During the day the pulse rose to 130; the redness and swelling extended to the body and down to the wrist. Iron, quinine, and stimulants given; discontinued stimulants at about three P. M., and gave spirits of mindererus and nitric ether, and, locally, lead and opium wash. July 28th, feels the quinine considerably; pulse 120; swelling and redness not much increased; tongue not much coated, red at the edge, and moist. July 29th, redness and swelling has crossed the line of nitrate of silver and extended upon the neck and on the sides; it is somewhat lessened where it first appeared; pulse 116; tongue but little coated, quite red; has severe headache. Tonics and stimulants, quinine in small doses at long intervals; lead and opium wash locally. July 30th, feels better; pulse 108; swelling extending on hand and down back; redness fading along the whole arm. 31st, diminished the stimulant; fingers much swollen; redness and swelling has reached to the hip. August 1st, swelling and redness still extending over the body; has disappeared in the arm; pulse 120 and feeble; tongue still coated; bowels loose. Quinine, iron, and brandy ordered. 2d, redness and swelling extending over abdomen and down on the hips; pulse 112 and a little stronger; tongue moist. 3d, redness and swelling has not extended; pulse 90 and full. 5th, redness disappearing over most of his body, but still extending on the outer margin of its course; pulse 100, a little quicker; tongue quite clean. 6th, redness almost entirely disappeared. 8th, all symptoms of erysipelas have disappeared; the wound discharges some; appetite good. 11th, is able to be up and walk about; but little dressing. 20th, wound has not quite healed up; elbow joint is quite stiff, though he has some motion; uses his arm considerably; appetite good; all medicine discontinued; simple dressing and exercise employed. The patient continued much the same until October 1st, at which time the arm was quite stiff; the patient could not put his hand to his mouth, but could touch his forehead, and could not rotate the hand; he was detailed on duty as mounted orderly at headquarters. He was discharged April 29, 1864, and pensioned." Examiner R. A. Wells, Jefferson City, October 29, 1866, reported: "Wounded by a ball which entered the right arm near the external condyle of the elbow joint, and, passing directly through the joint in a somewhat diagonal direction, escaped about an inch above the internal condyle, evidently fracturing badly the heads of both radius and ulna, * *; complete anchylosis of said joint; arm bent at nearly a right angle; the entire arm has wasted away to a considerable degree." Examiner A. H. Coffee, of Carthage, September 13, 1869, reported: "Complete anchylosis; atrophy of muscles of arm;" and in September, 1873: "Rotation of arm destroyed" This pensioner was paid December 4, 1874.

[1] COLE (J. J.) (*Military Surgery*, 1852, p. 155), although a determined advocate of primary amputation for shot wounds of the elbow, relates that: "In Major Edwardes's second battle with the Sikhs, one of his best officers was badly wounded in the right elbow joint. I saw him a few days after, when suppuration was profuse. The articulating extremities of the humerus, radius, and ulna were all exposed to view—the latter two broken. The patient would not hear of amputation, or even of extraction of detached portions of bone, but left camp in disgust at the European doctor. He recovered, with a useless arm. (See Major EDWARDES'S '*Year in the Punjaub.*')"

The various appliances employed in the treatment of shot fractures and excisions at the elbow will be more fully noticed in the sequel; but it is convenient meanwhile to intercalate in the text figures of some of the forms of apparatus employed. FIG. 589 represents Dr. L. Bauer's wire splint,[1] and FIG. 590 Professor Esmarch's suspension splint.[2] References to cases of shot fracture of the elbow treated on the expectant plan in foreign countries are continued in the foot notes,[3] and other instances from the large number returned from the American war, are adduced in the text, selection being made of such as exemplify the repair of different varieties of injury, or illustrate the divers complications which impeded recovery:

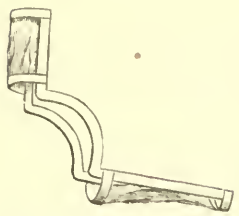

FIG. 589.—Bauer's wire elbow splint.

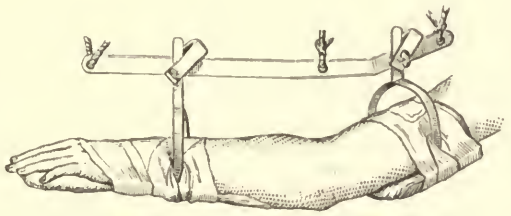

FIG. 590.—Esmarch's elbow splint. [After OCHWADT.]

CASE 1749.—Private J. A. Erwin, 8th Battery, 2d Indiana Artillery, was wounded at Chickamauga, September 19, 1863, and was treated in Hospital No. 8, Nashville, for "gunshot wound of the left elbow joint, with fracture." On December 13th he was furloughed, and January 5, 1864, admitted to the hospital at Evansville, Indiana. Acting Assistant Surgeon J. A. Janson reported: "The ball passed through the elbow joint in an oblique direction from the bend of the elbow, back toward the edge of the olecranon. January 12th, the joint is anchylosed; the wound is gangrenous; application of bromine to wound, and stimulants often. The general health of the patient is feeble. January 25th, the wound is healing kindly, but the constitutional disturbance is still marked. Suppuration growing less, and granulation going on under the sloughing surface. February 20th, the wound is improving, and the general health is good. March 2d, patient put on light duty; the joint is completely anchylosed. April 12th, discharged on surgeon's certificate of disability." Examiner B. I. Day, April 13, 1864, certified: "Ball entered elbow through anterior aspect; joint anchylosed; wound discharging, and hand quite useless for the present." Examiner S. E. Munford, September 4, 1873, certified: "The ball entered at the external condyle, fracturing the lower end of the left humerus. Considerable bone is missing; the joint is perfectly stiff; the forearm is flexed at an obtuse angle." This pensioner was paid December 4, 1874.

Few cases of this group were reported with detailed histories, and the abstracts of recoveries with anchylosis from shot injuries of the elbow have been compiled, with few

[1] BAUER (L.) (*Contributions to Surgery*, in *St. Louis Med. and Surg. Jour.*, 1870, Vol. VII, p. 193). Professor BAUER presumes this splint "to be preferable to the plaster of Paris bandage, from the fact that it is equally effective in immobilizing the elbow, and leaves the wound more approachable to wet applications without lacking in firmness."

[2] As figured by Oberstabsarzt OCHWADT (*Kriegschir. Erf.*, 1865, S. 235, and TAF. II), and described as a flat iron rod suspended above the arm and parallel with its axis. The limb reposes on dish-shaped padded splints, one for the upper and one for the forearm, which are hung from the rod by movable stirrups.

[3] The annals of the French Revolution of 1830 furnish some examples of the successful expectant treatment of shot injuries of the elbow. Thus: MENIÈRE (P.) (*L'Hotel-Dieu de Paris en Juillet*, 1830, p. 321) records the case of "Grenier, a plumber, aged 28, whose left elbow was shattered by a ball July 29, and who was in a fair way to recover September 16th." JOBERT (A. J.) (*Plaies d'armes à feu*, Paris, 1833, p. 356) details two instances of shot fracture of the right elbow among the insurgents of July, 1830. Both patients recovered under expectant measures, with stiff joints. To these may be added a case referred to about the same period by MALLE (*Clinique Chirurgicale de Strasbourg*, 1838, p. 624): An officer of the 26th regiment received, March 10, 1830, in a duel, a pistol ball perforation through the right elbow joint. With local depletion and cold irrigation, he recovered with a stiff arm. The late M. BAUDENS (*Clinique des Plaies d'Armes à Feu*, Paris, 1836, p. 444) sets forth that: "Lorsque la balle n'a pas atteint les cartilages interarticulaires, et qu'elle a borné son action à la perforation d'un condyle avec déchirure partielle des ligaments, sa lésion est moins grave que dans le cas contraire; car dans cette hypothèse il n'y a pas de corps étrangers entre les surfaces de l'articulation, et s'il est vrai que des fentes se prolongent souvent jusque dans celle-ci quand un condyle a été nettement perforé par une balle, cette blessure n'en est pas moins susceptible de guérison. Or, on conçoit que ces considérations ne se rapportent qu'aux articulations par ginglymes, parce qu'en effet la tête des os qui constituent des énarthroses, quand elles viennent à être atteintes par des balles, laissent toujours des débris osseux dans la capsule articulaire; et si le projectile sort au-dessous de cette capsule, on n'a plus affaire qu'à une solution de continuité du corps des os. D'où il résulte que toute plaie d'articulation par énarthrose avec brisure des têtes articulaires exigent l'amputation ou la résection, tandis que celle par ginglyme est guérissable sans opération chirurgicale, lorsque les surfaces articulaires n'ont pas été en contact immédiat avec le plomb. Aussi n'ai-je jamais vu guérir les fractures de la tête du fémur et de l'humérus, tandis que la guérison a presque toujours été obtenue après les plaies de l'articulation *huméro-cubitale*, radio-cubitale, tibio-tarsienne, et même tibio-fémorale, celle-ci toutefois beaucoup plus difficilement que les trois autres; ces vérités ressortiront de l'examen des faits exposés ci-dessous." He then adduces four instances from the Algerian campaigns (1831–1836) who recovered from shot fractures implicating the elbow, under expectant treatment, viz: E———, 13th regiment, aged 25 years, musket ball in joint; recovery in three months after extraction of ball and bone fragments. H———, 17th regiment, wounded at Tufna, the ball breaking the olecranon and passing down the forearm; recovery in three months with anchylosis. D———, 47th regiment, and T———, 17th regiment, with fractures of the olecranon and epicondyle or epitrochlea on the same occasion; recovered in three months with stiff joints. The four cases were treated by free incisions, removal of primary splinters, cold applications to the joint, and the extraction of secondary sequestra. In the discussion at the Paris Academy, in August, 1848 (*Comm. sur des plaies d'armes à feu*, par MM. AMUSSAT, BLANDIN, etc., 1849, p. 152), it appears that most of the shot wounds of the elbow in the late insurrection had been treated by excision or amputation; but two cases were reported from Hotel Dieu of recovery with incomplete anchylosis. BERTHERAND (A.) (*Campagnes de Kabylie, Histoire Médico-Chirurgicale des Expéditions de* 1854–6–7, Paris, 1862, pp. 127 and 162) details two examples of expectant treatment of shot fractures of the elbow: H——, 1st Zouaves, received a shot comminution of the right olecranon and trochlear extremity of the humerus, and recovered in three months; there was incomplete anchylosis, some flexion, but imperfect extension. Capt. L——. of the Chasseurs, with shot splintering of the articular extremity of the ulna, recovered in five months, with anchylosis, but good use of the hand.

exceptions, from brief hospital entries and pension memoranda. If not presented with the vividness of a connected narrative by a single hand, the examples gain, perhaps, in authentic value, from the corroborative evidence[1] accumulated from several sources.[2] The next case is another example of the complication of hospital gangrene:[3]

CASE 1750.—Private J. Mattice, Co. K, 1st New York Artillery, was wounded at Chancellorsville, May 2, 1863, and was sent to Aquia Creek Hospital. On June 14th, he was transferred to Douglas Hospital, Washington, and on October 29, 1863, to St. Joseph's Hospital, New York. Acting Assistant Surgeon G. T Shrady reports that: "The conical ball entered the left elbow joint on the anterior face, and was extracted on June 11th from the posterior part of the joint, together with several fragments of bone. Patient states that erysipelas set in in the latter part of July and terminated in gangrene. The treatment of the latter consisted in the application of nitric acid for the first week; but it did not seem to benefit the case, and bromine was next used, applied once a day for four days, when the gangrene was arrested. Constitutional treatment consisted of milk punch and a good nourishing diet. One piece of bone has been thrown out of the wound of entrance since the operation. This piece came out about October 1st. The wound is still discharging a little. The joint is anchylosed at nearly right angles." Discharged November 12, 1863, because of "anchylosis of the left elbow joint," and pensioned, and paid December 4, 1874.

CASES 1751–1753.—Private W. C. Duckett, Co. K, 4th Infantry, wounded at Petersburg, June 15, 1864, was sent to Annapolis by a transport steamer June 20th. Acting Assistant Surgeon C. W. Neff reported: "A fracture of the right elbow by a musket ball, which had entered the posterior portion of the forearm and passed through the joint. Oakum dressings were used, and full diet" This soldier was discharged April 16, 1865, and pensioned. Examiner Owens reported, March, 1866: "Partial loss of motion at joint; is unable to flex the fingers and thumb of the right hand." Examiner J. O. Stanton reported, in September, 1873: Cicatrices sound; slight atrophy of muscles; some loss of motion in thumb and index. Was pensioned December 4, 1874.——Serg't B. D. Savage, Co. F, 3d Maine, aged 22 years, was wounded at the Wilderness, May 5, 1864. Surgeon D. Evarts, 20th Indiana, recorded: "Shot fracture of right elbow." The patient was treated at Campbell Hospital, Washington: discharged June 28, 1864, and pensioned. Examiner C. W. Snow, of Maine, reported, June 30, 1864: "A minié ball entered the right forearm, upper third, coming out above the joint, and fracturing the humerus; arm perfectly useless." Examiner A. Lambert, of Massachusetts, March 1, 1865, recommended a reduction of pension, stating: "The arm is improving rapidly, and the applicant is beginning to earn a respectable livelihood." Examiner G. A. Wilbur, of Maine, reported, March 5, 1866: "Shot wound of ulna, five inches below olecranon, to just above the right external condyle, shattering the lower end of the humerus. The arm cannot be extended exactly straight; otherwise perfect." Examiner Snow again reported, September 4, 1873: "Motion of elbow joint impaired; arm atrophied and painful; disability one-half." This pensioner was paid June 4, 1874.——Pt. F. Hintzpeter, 22d Illinois, aged 30 years, was wounded at Belmont, Missouri, November 7, 1861, and sent to Mound City Hospital on November 13th. Surgeon E. C. Franklin, U. S. V., reported: "Shot wound of right arm, fracture of humerus into elbow joint; recovered with partial anchylosis; arm bent at 45°; can use it well." This soldier was sent to duty January 27, 1862, and was discharged the service March 5, 1862, and pensioned. Assistant Surgeon W. W. Bailey, 22d Illinois, reported: "Anchylosis of right elbow joint, produced by shot wound; disability total." This pensioner was paid June 4, 1874.

In the three foregoing cases recovery took place with incomplete anchylosis, although

[1] WILLIAMSON (G.) (*Military Surgery*, 1863, p. 168) relates that four soldiers returned from the Indian Mutiny of 1858, invalided on account of shot fractures of the elbow, treated on the expectant plan. "In these elbow joint cases there can be no doubt of the direct penetration of the joint, with comminution of bone, resulting in anchylosis. In three of them the ulnar nerve was injured. In these instances the olecranon was fractured, and in one case the external condyle; the joint was anchylosed in all of them. In three of them the forearm was at an obtuse angle. In the fourth case the arm was quite straight and the elbow joint anchylosed, rendering the arm very useless; but in this case the humerus had also been fractured, making it very difficult to treat; even now the limb is much more useful than any artificial arm which he could have been supplied with. In none of them had resection been performed, and it becomes a question whether these patients would have had a more useful arm had the joint been excised so as to allow of free motion of the joint. If it were possible to induce patients to use the arm at an earlier period of the treatment, they might preserve some motion of the joint." The pensioners were: 1. Pt. Arthurs, 32d regiment, aged 33 years, wounded at Lucknow, September 27, 1857; musket ball entered the external condyle and passed out at the inner side of the olecranon. The arm was anchylosed in a bent position. No sensation in little finger and outer half of ring. 2. Pt. Wardleworth, aged 34 years, wounded at Lucknow; musket ball fracture of olecranon; abscess of joint; anchylosis. 3. Pt. Marshall, 52d regiment, aged 27 years; wounded at Delhi, September 14, 1857; pistol ball perforation of left elbow. Anchylosis in bent position; anæsthesia on ulnar side. 4. Pt. Dunne, 61st regiment, aged 38 years, wounded at Delhi; musket ball fracture of shaft of humerus, with perforation of joint and fracture of ulna. Elbow anchylosed with limb in extension; an inch and a half shortening.

[2] M. CHENU (*Campagne d'Italie en* 1859–60, Paris, 1869, p. 602) tabulates 162 shot wounds of the elbow with 17 deaths, and enumerates 88 cases of pensioners with more or less complete anchylosis, many suffering also with various degrees of muscular atrophy and paralysis. In the same work, Dr. CUVELLIER, chief surgeon of the French military hospital San Ambrogio, at Milan, observes: "Les blessures graves de la région huméro-cubitale, les fractures comminutives compliquées de lésions s'étendant jusqu'à l'articulation, *sont de celles qui ont retiré le plus d'avantages de la temporisation*. A moins de désordres tellement étendus que l'amputation fût exigible sur le champ de bataille, il nous fut permis pour cette région d'attendre plus longtemps qu'on ne le pense en général." On the German side, Dr. DEMME (*Studien*, 1860, B. II, S. 232) observes that: "The extended practice of the conservative expectant treatment of shot comminutions of the elbow joint in Italy has proven that the hopes of success are less than in injuries of the shoulder joint, but that, nevertheless, frequent cures are accomplished in this manner," and cites six cases of this class, the patients having all recovered with anchylosis; and, on p. 235, tabulates 81 cases of fractures of the elbow joint treated on the conservative expectant plan, with 52 deaths, or 64.2 per cent. And again, on page 235, adds: "The active conservative treatment (resection) found few advocates in 1859 in Italy. The majority of the Italian and French surgeons choose between the expectant conservative treatment and amputation, a fact incomprehensible in the face of the results of latest campaigns. The only two resections of the elbow that I call to mind were performed by my friend Neudörfer, at the hospital San Spirito in Verona, and had favorable results."

[3] The results published of the conservative treatment of shot injuries of the elbow in the Silesian or Bohemian or Six Weeks' War of 1866, are very satisfactory. Thus, Oberstabsarzt R. BIEFEL (*Im Reservelazareth. Kriegschir. Aphorismen* von 1866, in LANGENBECK'S *Archiv.*, 1869, B. XI, S. 432) records eleven cases of shot wounds of the elbow joint conservatively treated with success. One case recovered with complete motion, nine with limited motion, and one case resulted in complete anchylosis. The Swiss ambulance-surgeon K. FISCHER (*Militairärztliche Skizzen, aus Süddeutschland und Böhmen*, Aarau, 1867, S. 69) tabulates twelve cases of shot fractures of the elbow from the Bohemian battles treated conservatively, of which nine recovered and three died. He refers to thirteen cases of the same nature treated conservatively in South Germany, but is ignorant of their termination.

the evidence seems to show that they were instances of penetration of the joint, with lesion of some portion of the articular surfaces.[1] In the following cases, also of penetrating wound with fracture, recovery ensued with imperfect motion at the joint:

CASES 1754–1756.—Corp't J. Hare, Co. G, 21st Massachusetts, aged 21 years, was wounded at Chantilly, September 1, 1862. On September 5th, Acting Assistant Surgeon John Neill reported, from Philadelphia, a "fracture of the right elbow joint by a conoidal ball. The limb was placed in an internal rectangular splint, with cold-water dressings, and afterward stimulating poultices. Spicula of bone were removed. By November 1st the injury was repaired, with *considerable motion of the joint.*" This soldier was discharged January 16, 1863, and pensioned. Examiner Jewett, of Fitchburg, reported, September 6, 1864: "A ball entered the inner surface of the right forearm, and fractured the head of the radius and external condyle of humerus. Spicula of bone make their way to the surface from time to time. There is chronic inflammation of the joint and of the ulnar nerve. Imperfect and partial extension of the forearm is practicable." In 1869, Examiner A. Miller noted: "This wound has produced great pain and atony of the muscles." The Fitchburg Board reported, May, 1873: "There is *partial* anchylosis of the joint, and disease of the radial nerve, with constant pain. General appearance, worn and pale, the result of the wound. The pensioner is unable to do any manual labor." Paid September 4, 1875.——Pt. C. N. Summerlin, Co. H, 74th Indiana, aged 28 years, was shot in the left elbow at Chickamauga, September 19, 1863, and sent to Louisville, and thence to Madison, and treated by immobilizing the arm on a splint, with simple dressings. He was discharged March 24, 1864, Surgeon G. Grant, U. S. V., reporting: "With little motion at elbow; a gunshot fracture of the left external condyle has caused anchylosis. There is also a subluxation at the right elbow." Examiner Rerick, of La Grange, certified, April 4, 1868: "Wounded in left arm and elbow. The wound is now healed, but the elbow is anchylosed and the forearm cannot be fully straightened. Was injured by a railroad accident in the right elbow." Pensioner paid June 4, 1875.——Pt. H. McGuire, Co. D, 6th Vermont, aged 23 years, was wounded at Funkstown, Maryland, July 10, 1863, and sent to Hammond Hospital, with a shot fracture of the left elbow. Surgeon E. E. Phelps, U. S. V., reports that the patient was admitted to the hospital at Brattleboro', August 10, 1863, with a shot fracture of the humerus involving the elbow joint, and transferred to the Veteran Reserve Corps, February 17, 1864, with the fracture united and motion of the arm incomplete." This soldier was discharged October 1, 1864, and pensioned. Examiner Skinner, of Barton, Vermont, reported, in 1864: "Ball entered left elbow near the junction of the radius with the external condyle, and is now lodged in the arm, causing partial stiffness of the joint. The arm is lame; the wound is now healing." Examiner Woodruff, of Joliet, Illinois, certifies, September 6, 1873: "Shot entered left elbow, and was never removed; motion of joint greatly impaired." Pensioner paid September 4, 1875.

In some cases of recovery from arthritis following shot wounds in the region of the elbow, it is exceedingly difficult to determine whether the primary lesion directly implicated the ends of the bones, or even whether the capsule was penetrated. The two following instances appear to have been strictly periarticular wounds:

CASES 1757–1758.—Private W. Galbreath, Co. K, 6th Indiana, aged 35 years, received at Chickamauga, September 19, 1863, a shot wound of the left elbow. He was sent to Cumberland Hospital, and thence to Madison, Indiana. Acting Assistant Surgeon D. W. Flora reported, November 17, 1863: "The ball entered the forearm on the anterior surface while the elbow was flexed, and came out in the lower third of the arm, the wounds of entrance and exit being about four inches apart. The elbow is permanently flexed, and in view of the extensive suppuration in the vicinity of the joint, its structures are no doubt implicated. December 16th, inflammation has been pretty severe, and several abscesses have formed. Tincture of iodine applied once a day. February 4th, wound entirely healed; elbow permanently flexed; transferred to Invalid Corps March 23, 1864, and discharged October 10, 1864, and pensioned. Examiner Collins, of Madison, September 25, 1868, certified: "Minié ball entered exterior face of upper third of left forearm, and passed upward to near the shoulder joint, where it was extracted. The left arm is greatly disabled." Dr. Collins made substantially the same report in 1873, and recommended a reduction of pension, and the disability was rated one-fourth, at which estimate the pensioner was paid December 4, 1874.——Pt. E. F. Stevens, Co. A, 1st Maine Cavalry, was wounded at Shepherdstown, July 16, 1863, and sent to Camden Street Hospital, Baltimore, on July 19th. Acting Assistant Surgeon E. G. Waters noted: "A minié ball entered the posterior aspect of the left arm just above the olecranon, passed downward and outward, and emerged on the outer aspect of the forearm, below the outer condyle of the humerus, crossing the elbow joint in its passage, and probably getting within its capsule." The patient was discharged June 26, 1865, and pensioned. Examiner J. C. Weston, of Bangor, May 18, 1866, reported: "The motions of the elbow joint are impaired. Can only extend his left arm half way between a right angle and a straight line, and can only flex it to a right angle. There is atrophy of arm and forearm. They measure in circumference nearly an inch less than the other. Cannot as well lift, chop, etc., with it. Complains of an occasional rheumatic pain in the joint, and a creaking noise can be heard on motion." The Bangor Board, Drs. Jones and Sanger, August 3, 1874, reported: "The forearm was at a right angle with the humerus, which was raised in front of his body when wounded." Paid December 4, 1874.

In a great proportion, however, of this series of eight hundred and twenty-eight cases of recovery after shot wounds at the elbow treated on the expectant plan, the evidence of penetration of the joint and injury of the articulating extremities of one or more of the

[1] BECK (B.) (*Chir. der Schussverletzungen*, 1872, S. 588) details two cases of shot injury of the elbow joint without injury to the bone: B——, of the 1st Baden grenadiers, received a shot wound of the elbow which opened the joint; bone not injured; synovia escaped; recovery in five weeks. From the fact that the man did not apply for a pension, Dr. Beck presumes that the usefulness of the arm was only slightly impaired. W——, 2d Baden regiment, received a similar wound; synovia escaped. Patient recovered, with partial anchylosis.

bones was incontestable, and the ordinary result was more or less complete anchylosis, often associated with muscular atrophy, and not infrequently with paralysis and neuralgic affections.[1] When the outer condyle and head of radius escaped, motion in pronation and supination was sometimes retained, although anchylosis of the humero-cubital joint forbade all movement of flexion and extension:

CASES 1759–1761.—Private G. Best, Co I, 186th New York, aged 39 years, was wounded at Fort Hell, Virginia, April 2, 1865, and sent to Harewood Hospital, Washington. Surgeon R. B. Bontecou, U. S. V., noted: "Patient was admitted April 5th, with a shot wound of the left elbow joint. Erysipelas supervened; but with the liberal use of tincture of sesquichloride of iron and supporting treatment the patient recovered and was doing well, the parts nearly healed, on July 20th, when transferred to Lincoln Hospital. This soldier was discharged August 3, 1865, for "anchylosis of the left elbow in consequence of a minié ball passing through the joint." Examiner Johnson, of Watertown, New York, September 22, 1873, reported: "Shot wound of the left forearm at upper fourth, complicating the elbow joint, producing complete anchylosis; the forearm flexed at right angles with the humerus; circulation and strength impaired." This pensioner was paid December 4, 1874.——Pt. E. W. Law, Co. A, 1st Massachusetts, aged 21 years, was wounded at Oak Grove, June 25, 1862, and sent to St. Elizabeth Hospital, Washington: returned to his regiment at Fort Worth, Virginia, and subsequently discharged and pensioned. Surgeon F. LeB. Monroe, 1st Massachusetts, certified on his discharge papers: "Anchylosis of the right elbow joint, the result of shot wound. There is immobility of the joint, probably permanent, with loss of the power of supination." Examiner G. S. Jones, of Boston, recorded, October 14, 1862: "Anchylosis of right elbow joint. The arm has been left in a straight and pronated position, and its usefulness destroyed. It is the result of a shot wound of the elbow joint, and his disability is increased in consequence of neglect in its management." Examiners Fry, Treadwell, and Chase, of Boston, reported, August 9, 1871: "A ball entered the right arm at the insertion of the biceps, and escaped from between the olecranon and the inner condyle, its course being directly through the joint, which latter is anchylosed in a slightly flexed position. The ulnar nerve was divided, and connections have never been re-established. That part of the hand dependent upon the ulna for nervous power is paralyzed, and the flexor power of the radial side of the hand is so much weakened as to destroy the usefulness of the member." This pensioner was paid June 4, 1874.—— Private J. A. Dingman, Co. G, 134th New York, was wounded while shooting at a mark at Thoroughfare Gap, November 5, 1862, and sent to Satterlee Hospital, Philadelphia, December 12, 1862. Acting Assistant Surgeon J. Berryman reported that: "The ball entered the anterior aspect of the left arm at the flexure of the elbow, and passed into the articulation, where it still remains. At present there is nearly complete anchylosis of the joint, and a discharge from the wound very like synovial fluid. The patient's general health is feeble. The limb was put in an angular splint, with cold-water dressings. The patient was ordered quinine and iron and extra diet." The patient had a series of chills, with pulmonary complications, which excited apprehensions of the invasion of pyæmia. Abscesses formed about the joint, and were freely incised, and quinine was administered, and the part poulticed. On December 16th he was ætherized and a flattened pistol ball was removed. On January 28, 1863, he was discharged. Examiner Dockstader, of Sharon, reports that: "He has a crooked arm and stiff elbow, with no use of the fingers; he cannot get his hand to his mouth." As the wound was accidental no pension was allowed.

[1] From the Franco-German war of 1870–71 we have many references to the expectant treatment of shot fractures of the elbow, from both French and German sources. Professor ALBERT SCHINZINGER, of Freiburg (*Das Reserve-Lazareth im Kriege*, 1870 *und* 1871, S. 64) states that there were received at the hospital at Schwetzingen eight cases of shot fracture of the elbow, of which one was treated by resection and seven by expectation. All recovered, and of the seven treated expectantly, two retained motion of the joint, while five had anchylosis in favorably flexed positions. Professor LÜCKE, of Bern (*Kriegschirurgische Fragen und Bemerkungen*, 1871, S. 41), records seventeen examples of shot fracture of the elbow, of which two were treated by amputation, eleven by excision, and four by expectation. Of the latter group, three recovered with anchylosis, and one submitted to consecutive exarticulation at the shoulder. Professor LÜCKE declares that to him "it is indubitable that a large proportion of shot injuries of the elbow joint may be successfully treated conservatively, that is without any operation whatever." Dr. LUDWIG MAYER, of Münich (*Kriegschir. Mittheilungen aus den Jahren* 1870–71, in *Deutsche Zeitschrift für Chirurgie*, Leipzig, 1873, B. III, S. 50), records a case of recovery after shot fracture of the elbow. MACCORMAC (W.) (*Notes and Recollections, etc.*, 1871, pp. 94–106) records fifteen cases of penetrating shot wounds of the elbow, and remarks: "In the great majority resection was performed at once, *as all secondary operations do so very badly*. In a few cases of elbow wounds, for one reason or another, expectant surgery received a trial." He then details two such cases,—of Vivien and Soitel, of the 89th French infantry, who recovered very satisfactorily after Sedan. PONCET (F.) (*Contribution à la relation méd. de la guerre de* 1870–71. *Hôpital milit. de Strasbourg*, in *Montpellier Médicale*, 1872) records a case of recovery, with anchylosis, of shot fracture of the elbow, healed without operative interference. SÉDILLOT (*Du traitement des fractures des membres par armes de guerre*, in *Arch. gén. de méd.*, 1871, IV sér., T. XVII, p. 409) relates eight cases of conservative treatment of shot wounds of the elbow joint with seven recoveries. CHRISTIAN (J.) (*Relation sur les plaies de guerre observées à l'ambulance de Bitschwiller*, 1870–71, in *Gaz. méd. de Strasbourg*, 1872, No. 23, p. 279) cites five cases of shot wounds of the elbow joint treated on the expectant conservative plan. All recovered; but one died of variola afterward. RAËIS (E.) (*Deux cas remarquables de blessure par armes de guerre observés a l'ambulance internationale de Pfaffenhofen, in Gaz. méd. de Strasbourg*, 1872, No. 3, p. 26) gives an interesting case of successful treatment on the expectant conservative plan of a shot injury of the elbow joint. COUSIN (A.) (*Hist. chir. de l'ambulance de l'école des ponts et chaussees*, in *L'Union méd.*, 1872, T. XIII, p. 126) notes two cases of shot wounds of the elbow joint treated expectantly, favorably in one case, and with a fatal result in the other. GROSS (F.) (*Notice sur l'hôpital civil pendant le siége et le bombardement de Strasbourg*, in *Gaz. méd. de Strasbourg*, 1871, No. 12, p. 139, CASE 20) adduces an instance of complicated fracture of the elbow successfully treated on the expectant conservative plan. CHIPAULT (A.) (*Fract. par ames à feu*, 1872, p. 35) records a shot comminution of the right olecranon, with suppurative arthritis, extraction of fragments, and copious suppuration, but recovery with some movement of the joint. He gives (p. 128, *Obs.* XC) another case, in which expectation was persevered in for many weeks after a musket ball perforation of the right elbow, the recourse was ultimately had, and successfully, to resection. SOCIN (A.) (*Kriegschir. Erf.*, 1872, S. 158) mentions two instances of shot fracture of the elbow successfully treated without operative interference. GOLTDAMMER (*Bericht über die Thätigkeit des Reserve-Lazareths des Berliner Hülfsvereines, etc.*, in *Berlin Klin. Wochenschrift*, 1871, SS. 139–149) records two cases of shot wounds of the elbow joint successfully treated by the conservative plan. STOLL (*Bericht aus dem Königlich Würtembergischen 4 Feldspital von* 1870–71, in *Deutsche Mil.-ärztl. Zeitschrift*, 1874, B. III, S. 193) remarks: "Of eleven shot injuries of the elbow joint (seven from small projectiles, four from shell) three were conservatively treated,—one proved fatal; the result in the other two cases is unknown." STUMPF (L.) (*Bericht über das Kriegsspital des St. Georg-Ritter-Ordens zu Neuberghausen*, in *Bayerisches Ärztl. Intelligenzblatt*, 1872) records three cases of conservative expectant treatment of wounds of the elbow joint; two recovered with anchylosis, one proved fatal from tetanus. BECK (B.) (*Chir. der Schusverletzungen*, u. s. w., 1872, S. 588) records 41 cases of shot wounds of the elbow, of which 15 were treated by expectation, without a single fatal result; 9 by intermediary or secondary amputation, with 5 deaths; and 17 by excision, with 2 deaths.

We have seen, on page 674, that, although conservation of the limb has been advocated in cases of shot fracture of the humerus complicated by wound of the brachial artery, our late war experience is not known to have furnished an example of a successful essay in this direction; and, indeed, according to Guthrie and Lœffler,[1] the annals of military surgery afford no instance of such an achievement.[2] The following successful operation, by Dr. A. V. Cherbonnier (now Medical Storekeeper, U. S. A.), gives, however, irrefragable evidence that, in shot fracture of the condyles of the humerus with lesion of the *radial*, it is possible to tie the vessel and to preserve the limb:

CASE 1762.—Private J. H. Scritchfield, Co. B, 20th Indiana, aged 21 years, was wounded in the left elbow at Spottsylvania, May 12, 1864, and sent to the hospital of the 3d division, Second Corps, where Surgeon D. Evarts, 20th Indiana, recorded: "Gunshot wound of arm." The wounded man was transferred, May 18th, to Patterson Park Hospital, Baltimore. Surgeon T. Sim, U. S. V., reported: "A minié ball entered above the left olecranon process, making exit near the bend of the elbow. Hæmorrhage occurred, on May 24th, to the amount of six ounces, and was controlled by pressure and persulphate of iron. Hæmorrhage recurred May 31st, to the same amount, and was controlled by the same means. A third hæmorrhage occurred on June 7th, when the probable loss of blood amounted to sixteen ounces. The probable source of bleeding was the radial artery. On the last occasion, the brachial artery was ligated at the lower third by Acting Assistant Surgeon Cherbonnier, the patient at the time of the operation being very feeble and pale. There was no recurrence of hæmorrhage; the patient rallied and recovered. There was partial anchylosis of the joint. He was transferred, July 20th, to La Fayette, Indiana, and mustered out July 29, 1864, and pensioned. Examiner Clippinger, of Indianapolis, Indiana, July 30, 1864, certified: "Has been shot through the left elbow; the brachial artery has been tied. The wound is still suppurating. There is inability to use the forearm and it remains flexed." Examiner S. Roberts, of Manhattan, Kansas, reported February 10, 1869, and September 6, 1873: "The applicant was wounded in the left elbow, the ball passing from behind forward, fracturing the lower portion of the humerus and wounding the radial artery in its upper third, making necessary the ligation of the brachial artery in its lower third, thereby hindering the circulation and preventing the proper nourishment of the arm and hand. He has partial anchylosis of the elbow joint, having neither perfect flexion nor extension of the forearm. . . . The limb is somewhat atrophied." This pensioner was paid September 4, 1875.

The two following cases of shot wounds at the elbow complicated by hæmorrhage and successfully treated by ligation of the brachial, are reported; but it appears probable that they were both examples of periarticular wounds; at least, there is no direct testimony that the extremities of either the humerus or bones of the forearm were fractured. On page

---

[1] LŒFFLER (F.) (*General-Bericht*, u. s. w., 1867, B. I, S. 231) details the case of J. Fries, 9th Danish Infantry, wounded April 18, 1864. The missile passed through the olecranon and comminuted the epiphysis of the humerus at the inside of the arm. Tourniquet applied to control the bleeding. April 20th, resection. Death, April 22, 1864. At the autopsy the ulnar artery was torn high up, and the brachial artery was obstructed at the point of division by a thrombus. Dr. LÖFFLER concludes: "The co-injury of the brachial artery itself, in cases of shot fractures of the elbow joint, is sufficient cause for immediate amputation, and the practice of 1864 does not show a single case in which, with this complication, life and limb were preserved." Case 157 (Fries, above cited) renews the admonition, to consider this point before attempting conservation or resection, even if bleeding should not remind you thereof at the moment.

[2] That compound fracture of the humerus, or femur, complicated by wounds of the main arteries of the limb, demand amputation, had come to be one of the commonplace precepts of practical surgery, and is still taught in the best modern surgical text-books; thus ASHHURST (J., jr.) (*The Principles and Practice of Surgery*, 1871, p. 164) emphasizes: "Especially do wounds of the main arteries and nerves of a limb, in conjunction with fracture, demand amputation." But there have always been surgeons who have urged that, on account of the freedom of anastomosis, etc., the danger was much less in the upper extremity. LE DRAN (1675–1770) was one of the earliest writers to intimate that injury of the brachial, in shot wounds of the arm, does not necessitate amputation. Although he could not be accused of timidity, yet, as SPRENGEL tells us, he was very reluctant to sacrifice limbs. In his *Traité ou Reflexions tirées de la Pratique sur les Playes d'armes à feu*, 1737, p. 107, he teaches that when a ball passes in the vicinity of the brachial artery, the surgeon should be watchfully on his guard, placing about the limb a loose tourniquet for use in case of accident; if hæmorrhage supervenes, he must make an incision and place a ligature on the vessel: "Si c'est le tronc de l'artérie, il ne faut pas moins en faire la ligature, quitte à faire après, l'amputation du membre si l'on s'aperçoit que, faute de nourriture, il soit menacé de gangrene." GUTHRIE (G. J.) (*A Treatise on Gunshot Wounds*, 3d ed., 1827, p. 516) says: "If the artery be wounded with an extensive fracture, the operation is then imperious; but if it be wounded with merely a splintering of the bone, without complete solution of its continuity, or even if it [the bone] be broken short across, with little or no splintering, the vessel should be secured above and below and the event carefully watched. *I have no case in support of the opinion;* it is therefore more theoretical than practical; but I think it a case well deserving trial." M. LEGOUEST (*Chirurgie d'armée*, 1863, p. 689) believes that if, in shot fracture of the shaft of the humerus, the brachial artery is divided below the origins of the external circumflex and nutritious arteries, conservation may be attempted. His opinions, and those of Professor BILLROTH and Dr. HOFF, and the opposing views of Herr LÖFFLER, are cited at length on page 674 *ante*. I believe that Dr. LÖFFLER's assertion, that surgical literature has not presented an example of recovery from shot fracture of the humerus with division of the brachial, remains uncontradicted. VELPEAU, it is well known, gives a remarkable case (*Nouv. élém. de méd. operat.*, 2me éd., 1839, T. II, p. 568) from CHAMPION, of a boy of seven, with compound fracture of the lower part of the left humerus, with injury of the artery and nerve, in whom HERIOT divided and ligated the brachial, resected and reduced the humerus, and preserved the arm (see BLACKMAN'S MOTT'S VELPEAU, 1853, Vol. II, p. 289). But this was not a shot fracture, and the injury was very low down. CHISOLM (J. F.) (*A Manual of Military Surgery*, 3d ed., 1864, p. 386) affirms: "Should the main vessel be injured, in connection with the fractured bone [humerus], we have not sufficient cause to sacrifice the limb; but, ligating the artery at its bleeding mouths, we treat the fracture as if this complication had not existed. Owing to the free anastomosis of the blood-vessels of the arm, mortification is not to be feared when a ligature is applied even to the brachial; a circuitous route soon supplies the needed nourishment to the parts beyond. Should the nerves as well as the artery be wounded, or the principal nerves be divided with the bone, then the limb, even when saved, would be a useless paralyzed extremity, and its immediate removal will save the patient a long, tedious, and painful convalescence." Dr. E. WARREN (*An Epitome of Pract. Surg. for Field and Hospital*, Richmond, 1863, p. 373) coincides in these opinions.

843 will be found abstracts of two fatal cases (1770, 1771) illustrating this complication, and completing the information it has been practicable to collect on this interesting topic.

CASE 1763.—Private *G. McClinty*, Co. F, 7th South Carolina Cavalry, aged 17 years, was wounded at Weldon Railroad, August 21, 1864. On the following day he was admitted to the depot hospital of the Fifth Corps, at City Point, where Surgeon W. L. Faxon, 32d Massachusetts, recorded: "Wound of right elbow." From City Point the patient was sent to Whitehall Hospital, near Bristol, and thence he was transferred to West's Buildings Hospital, Baltimore, on September 10th. Surgeon A. Chapel, U. S. V., in charge of the latter, reported: "Gunshot wound of right elbow joint. The wound became gangrenous and involved the lower part of the brachial artery, producing hæmorrhage, on September 20th, to the amount of thirty-two ounces. The artery was tied in two places above the line of the sloughing parts. Tonics and stimulants were used, and the patient did well, no hæmorrhage recurring. He was transferred to Point Lookout, for exchange, on October 17, 1864."

CASE 1764.—Private R. Graham, Co. B, 81st Pennsylvania, aged 43 years, was wounded at Malvern Hill, July 1, 1862, and entered Broad and Cherry Streets Hospital, Philadelphia, on July 31st. Acting Assistant Surgeon J. Neill contributed the following history: "Gunshot wound of left elbow joint. A round ball entered in front on the radial side of the forearm about two inches below the joint, and, passing obliquely inward and upward, made its exit on the inner side of the arm, about three inches above the internal condyle of the humerus, afterward producing a slight wound of the chest. No fracture detected. The radial artery was wounded, and profuse hæmorrhage followed, amounting to syncope. The patient remained insensible on the field until next morning, when he was removed to Savage Station. The arm was kept quiet, and cold water was applied to the parts. On the eighth day after the injury he suffered from a severe attack of secondary hæmorrhage, and a surgeon tied the brachial artery in its lower third. Violent inflammation of the elbow joint followed; an abscess formed on the front of the forearm and a large slough was thrown off. The ligature came away on the 8th day after the operation. At the time of admission the patient was very much broken down in health, the joint and forearm being still very much inflamed and discharging a large amount of unhealthy pus. He was ordered a good diet, with stimulants and tonics. A stimulating poultice was applied, and the arm kept at perfect rest on a rectangular splint. Under the treatment he improved rapidly and the parts healed, leaving a large cicatrix on the front of the forearm extending almost to the joints, and giving rise to a contraction of the tissues, resembling that of a burn. He stated that about two weeks after the artery was tied he was seized with severe pain in the forearm and hand, and trembling of the whole limb, which has continued to the present time. November 1st, is now able to walk about the ward, and will probably have a useful limb." The patient was discharged December 9, 1862, and applied for pension.

The twenty-five preceding abstracts of cases of shot wounds at the elbow successfully treated by expectation,[1] fairly represent those of the series most fully reported. I regret that a lack of clerical assistance has forbidden the search, in the files of the Pension Bureau, of the ulterior histories[2] of a larger number of cases. At a future day, it may be possible to supply this hiatus. As far as the investigation has gone, the results as to the average usefulness of the limb after conservative expectant treatment is not flattering.[3] Of the eight hundred and twenty-eight patients of the series who recovered, two hundred and eighty-five returned to modified duty, or were paroled or exchanged, and five hundred and forty-three were discharged. Among the survivors there were many examples of chronic arthritis, with caries and persistent fistulæ and exfoliations; many instances of paralysis and paresis, with shrunken and wasted limbs and contracted and powerless hands. The known instances of recovery with preservation of the functions of the joint were very few; and those with anchylosis in a favorable position, with freedom from disease about the joint and good use of the forearm and hand, were not numerous.

[1] MATTHEW (T. P.) (*Med. and Surg. Hist. of Brit. Army in Crimea, etc.*, 1858, Vol. II, p. 361) informs us that of 34 cases of shot injury of the elbow, reported after April 1, 1865 (4 officers and 30 men), 18 were treated by expectation, of whom 4 submitted to secondary excision, 2 to conservative amputation, 4 died without operation, and 4 underwent primary amputation. Of 16 submitted to primary excision, 3 died. M. CHENU (*Rap. sur la Campagne d'Orient*, 1865, p. 282) records 320 "*Blessures de l'articulation humero-cubital*," under the heads of fractures, 57; undetermined wounds, 97; wounds, 123; luxations, 4; and contusions, 39. At page 504, M. CHENU mentions four cases of excision of the elbow joint resulting fatally. It is impracticable to learn from his tabulations how many cases of *shot wounds of the elbow treated by expectation* recovered. The names of 70 pensioners are given, of whom 2 had suffered luxations, 1 a bayonet wound, and 67 either "fractures, wounds, or undetermined wounds of the elbow," cases that were probably, for the most part, shot injuries of the elbow; and it is added that 130 cases of these groups were discharged cured, or transferred, and that 79 died. It is impossible to draw precise conclusions from these statistics, or the yet more imperfect and confused reports of the surgical experience of the Russians in the Crimea.

[2] HANNOVER (A.) (*Die Dänischen Invaliden aus dem Kriege* 1864, Berlin, 1870, S. 23): "Of 54 invalids after injury of the elbow joint, 26 have complete and incurable anchylosis, a few suffer from atrophy or loss of power of forearm, or laming or incurvation of some of the fingers, especially of the last two fingers. In the rest the power of extension is generally more circumscribed than the power of flexion, and pronation and supination is in various degrees impeded or painful at passive motion."

[3] MOSSAKOWSKY (P.) (*Statistischer Bericht über* 1415 *Französische Invaliden des deutsch-französischen Krieges* 1870–71, in *Deutsche Zeitschrift für Chir.*, 1872, B. I, S. 236) observes: "Not less than thirty-eight penetrating elbow joint wounds were conservatively treated, and on the whole with not very pleasing results. Only in ten the wounds had healed; in the rest they yet suppurated freely, principally in consequence of bone sequestration within the joint—conditions that undoubtedly have finally led to serious consequences. . . In all cases the motion of the joint was destroyed. In twenty-cases the arm was anchylosed at nearly a right angle, in six at near 135°, and in twelve at nearly straight arm."

§ *Fatal Cases.*—We may turn now to the fatal cases, which are not uninteresting or uninstructive for the clinicians, and are most important for the pathologists. Setting aside fourteen instances in which the result was not ascertained, there remain ninety-six treated by expectation that terminated fatally. Several are illustrated in the Museum:

FIG. 591.—Caries a month after shot penetration of left elbow. *Spec.* 2189.

CASE 1765.—Private W. K———, Co. E, 32d Indiana, aged 36 years, was wounded at Missionary Ridge, November 25, 1863. He was admitted to the field hospital of the third division, Fourth Corps, where Surgeon W. W. Blair, 58th Indiana, recorded: "Wound of the left elbow." On December 3d the patient entered Hospital No. 1, at Nashville, where Surgeon C. W. Hornor, U. S. V., reported: "Gunshot fracture of left arm by minié ball. Treatment, simple water dressings and supporting diet. Death from exhaustion, on December 24, 1863. *Post-mortem* forty hours after death: On examination of the wound it was found that the missile had entered on the inner side of the elbow joint, passed backward, and fractured the olecranon process of the ulna. The tissues were very dark and fœtid immediately around the wound. Slight pleuritic adhesion was found in the right side of the thorax, and small hard tubercles in the apex of each lung, the lower lobe of each lung being highly congested. The heart apparently was healthy and weighed fifteen ounces; the liver was fatty and weighed five pounds and six ounces; the spleen ten ounces and healthy. Both kidneys were fatty and somewhat elongated, and weighed nine ounces each." The specimen (FIG. 591) was contributed by Acting Assistant Surgeon P. Peter, and consists of the bones of the left elbow, showing the ulnar articulating surfaces to be carious, and a slight plate of necrosed bone adhering in the upper part of the coronoid fossa.

CASE 1766.—Private *A. B*——, Co. C, 38th Georgia, was wounded at Gettysburg, July 1, 1863, and admitted into hospital at Frederick on the 6th. Acting Assistant Surgeon W. S. Adams reported as follows: "Wounded by a conoidal ball, which entered on the posterior and outer surface of the arm one inch and a half above the olecranon process, passing out anteriorly near the flexure, grooving its way through the bone immediately above the external condyle, the fracture communicating with the joint. The patient was a man of delicate frame, medium size, and was much worn down by the fatigue of marching and exposure. Water dressings were applied to the wound, and the patient was ordered nourishing diet. July 18th: There has been for several days considerable œdema of the limb and redness about the joint. On consultation, it was decided to make a resection of a portion of the injured part. Ether having been given for fifteen or twenty minutes without producing anæsthesia, a small amount of chloroform was added to the sponge, and, as near as I can guess, from one and a half to two ounces were poured on it, and then placed closely over the mouth and nose. In the course of from thirty to forty seconds stertorous breathing was produced, whereupon the surgeon in charge proceeded to operate, commencing his incision two inches above the olecranon and extending it downward one inch and a half below the joint, cutting down to the bone at the first incision. About this time, I noticed that the pulsation of the brachial artery was rapidly running down, and on observing the respiration and seeing no movements of the chest or abdomen, remarked that it had ceased, and immediately instructed one of the attending surgeons to examine the patient's tongue, and finding it had not fallen back, proposed that Marshall Hall's ready method should be instituted, which was done instantly, and kept up for half a minute, when the surgeon in charge, observing that there was no respiratory effort, immediately proceeded to open the larynx, and, after artificial respiration, by means of compressing and relaxing the chest and abdominal walls for about two minutes, natural breathing was re-established and a pulsation of the radial artery was felt. There was scarcely any hæmorrhage from the incision, and none, perhaps, entered the trachea; the edges of the wound were drawn together by adhesive straps. It not being thought proper to proceed with the operation, the patient was returned to his ward, and stimulants were ordered to be given freely, with generous diet. July 19th: Patient rested finely last night, and took broth very freely this morning for breakfast; pulse 130 and feeble; respiration quite easy. July 20th: He had a chill last night, and has but little appetite this morning; no evidence of bronchial trouble; skin disposed to be dry. July 24th: He has had a chill each day since last note, and considerable cough; auscultation affords well-marked evidence of capillary bronchitis throughout the whole extent of the left lung. Only a few râles can be heard in the right lung; the tongue is much coated and brown, appetite very poor; wound of the elbow little disposed to suppurate; no granulations are being thrown out. 25th: Cough more troublesome; the patient is much depressed in spirits, and refuses all manner of nourishment; the pulmonary trouble is increasing. Four o'clock P. M., slight hæmorrhage has taken place from the incision over the olecranon; no bleeding vessel can be discovered; it seems to be a general oozing from all the parts. Seven o'clock P. M., hæmorrhage of the same character has again occurred to the extent of three or four ounces; applied Monsel's solution freely to the parts, and ordered water dressings. 27th: Slight bleeding again this morning; respiration 40 to the minute; pulse very feeble and quick. The patient has been taking beef-tea and whiskey in the way of clyster for the last two days. 28th: The patient died this morning at ten o'clock. Autopsy six hours after death: On opening the chest I found two small abscesses, each containing about one ounce of pus, situated just beneath the pleura costalis on either side of the sternum, and about one inch and a half below the clavicle; capillary bronchitis well marked throughout the whole extent of the left lung; no pleuritic adhesions; right lung somewhat engorged, several small abscesses in the upper lobe. The mucous membrane of the smaller bronchii was only slightly congested, but otherwise healthy. I removed the larynx, together with several small rings of the trachea; the openings through the cricothyroid membrane shows the seat of operation." The specimen of the lower third of the right humerus (FIG. 592) was contributed to the Army Medical Museum by Assistant Surgeon R. F. Weir, U. S. A. The outer border is chipped just above the condyle, opening the joint. Superficial necrosis of the adjacent bone and the development of numerous foramina are observable.

FIG. 592.—Lower third of right humerus fractured by a conoidal ball. *Spec.* 3901.

Pyæmic infection, illustrated in the foregoing case, was reported as the cause of death in sixteen instances. The next most frequent cause of fatality was hospital gangrene,

alone or accompanied by consecutive hæmorrhage, complications that are exemplified in the two succeeding abstracts:

CASE 1767.—Corporal J. H———, Co. H, 68th Pennsylvania, age 21 years, was wounded at Gettysburg, July 3, 1863, and sent to Satterlee Hospital, Philadelphia, July 10th. Acting Assistant Surgeon W. C. Dixon states that "a buckshot struck the ulnar side of the right forearm two inches below the elbow, producing a slight flesh wound. The patient had chronic diarrhœa; the wound presented a very unhealthy appearance, and on the 23d began to slough, and acid nitrate of mercury was applied. On August 13th and 14th, profuse hæmorrhage took place from a recurrent branch of the ulna and was arrested by torsion. The sloughing continued until the structures of the elbow joint were destroyed. On September 7th pyæmia appeared, and terminated fatally September 14, 1863. Amputation had been proposed on August 20th, but the condition of the patient would not warrant an operation." This case furnished the Museum with specimen 2782 (*Cat. Surg. Sect.*, 1866, p. 152). "The entire articular surfaces are carious."

CASE 1768.—Sergeant J. Whittaker, Co. E, 33d Iowa, was wounded at Helena, July 4, 1863. On the 7th he was admitted into Jackson Hospital, Memphis, and, on the 30th, was transferred to Presbyterian Church Hospital. Acting Assistant Surgeon C. H. Cleveland noted as follows: "The patient, a man of nervous, bilious temperament, with light hair and eyes, was admitted with gangrene of the right elbow, having been wounded by a ball which had entered just above the outer condyle of the humerus, emerging three inches posterior to the entrance, fracturing the condyle in its course. The patient says he has suffered but little from it since the injury; his appetite has been good, but he has slept but little since that time; simple local dressings have been used. The patient's arm now presents a large ulcer on both the external and internal condyles, while the outer condyle is now protruding through the wound but resists attempts at its removal; it is still connected with the joint below, and drawn downward half an inch from the line of fracture; the patient's condition is good. A solution of sulphate of zinc was applied and tonics given internally. August 3d: Wound healthy and perfectly clean; zinc lotion continued. 5th: Appetite good, pulse firm, bowels regular; cannot sleep; application, tonics and stimulants continued. 6th: Wound granulating; bone still firmly attached to the joint; treatment the same. 8th: Found the same appearance; discontinued the medicine, but still gave milk punch. 10th: Slept poorly; bowels regular; appetite good; wound continues improving. 15th: Patient the same, wound improving slowly. 17th: Gangrene has been arrested for some days past under the use of bromine; this morning it has reappeared at one or two points; bromine reapplied. 20th: Gangrene still extending at one or two points; condyle detaching itself in small fragments. 25th: Patient sleeps well; wound scarcely changed in appearance; compound solution of bromine applied. 31st: Wound entirely clean, with the exception of the cavity over the outer condyle, which still retains a little fœtor; bromine was injected with a glass syringe. September 4th: Patient slept poorly; appetite small; he has had diarrhœa for the last few days; this morning he had a spell of vomiting; stomach irritable; no unfavorable change in the wound; simple dressings. 12th: Patient passed a restless night; the diarrhœa is but slightly checked; pulse quick, feeble, and irregular; tongue slightly coated; patient complains of soreness of the throat, which slightly troubles him upon swallowing; little appetite; seems to be failing fast; the arm has assumed a dark hue and a dry, shrivelled appearance. 16th: Patient very low; saccharine odor of the breath; hippocratic expression of countenance; pulse imperceptible; he died at 10 o'clock from pyæmia."

Granular degeneration of the kidney supervening after protracted suppuration, a complication that has attracted interest of late, is illustrated by the next case:

FIG. 593.—Anchylosis and necrosis after shot wound of elbow. *Spec.* 2749.

CASE 1769.—Private Bernard W———, Co. I, 37th New York, aged 22 years, was wounded at Williamsburg, May 5, 1862, and after treatment on the field was sent to Philadelphia, and entered Wood Street Hospital June 12. On December 6, 1862, Assistant Surgeon C. W. Hornor, U. S. V., reported: "Admitted with gunshot wound of the right elbow, with compound fracture of the lower extremity of the humerus, involving the joint; several large spiculæ of bone were removed. Still under treatment, with inflammation threatening the loss of the arm." On March 12, 1863, the patient was transferred to McClellan Hospital, Nicetown. Acting Assistant Surgeon C. H. Boardman noted: "Nothing but simple dressings were applied while he was under my care. There was at all times a profuse purulent discharge from the various orifices, through which small sequestra frequently came away. During the spring and summer his general condition was much improved under the use of tonics, stimulants, and nourishing diet. A few weeks before his death my attention was attracted by an œdematous condition of his feet and legs, which on one or two subsequent occasions became general, affecting the whole surface. This was corrected readily at first by diuretics. An examination of his urine proved it to be highly albuminous. From this time he became steadily worse, and about ten days or two weeks before he died was attacked with uncontrollable diarrhœa and vomiting, accompanied with extreme prostration. All available remedies were tried, some with a little temporary success, more with none. These symptoms all became partially alleviated shortly before death, which ensued August 20, 1863. I had almost forgotten to add that, at the autopsy, the kidneys presented the characteristic lesions of Bright's disease." The case is mentioned and the specimen figured in the preliminary surgical report in *Circular* 6, S. G. O., 1865, p. 30, and in the Museum catalogue of 1866, *Surg. Sect.*, p. 151. An anterior view of the specimen is given in the annexed wood-cut (FIG. 593), and a lateral view is presented in PLATE XIX, opposite, which is copied from Photograph No. 42 of the Surgical Series of the Museum. The specimen consists of "the right humerus and the upper thirds of the bones of the forearm, fifteen and a half months after shot injury; fracture of the humerus immediately above and involving the joint was followed by inflammation and resulted in anchylosis. New bone has formed to double the volume of the shaft at its lower extremity, and extending to the surgical neck. Through a number of cloacæ a very heavy sequestrum, occupying six inches of the shaft, is seen. The head of the bone is spongy, and a large part of the articular surface has been destroyed by ulceration. Donor: Dr. C. H. Boardman.

PLATE XIX. NECROSIS OF THE HUMERUS AFTER SHOT INJURY.

Of shot fracture at the elbow complicated by injury of a main arterial trunk, but successfully treated conservatively, an instance has been adduced on page 839, together with two cases of periarticular wounds with lesion of the artery. It is hardly necessary to observe that, in order to reasonably hope for such happy results, the wounded vessel must be ligated above and below the seat of injury. In the two following cases, in which this complication was presented, a single ligature was ineffectually placed on the bleeding vessel:

CASE 1770.—Private W. E——, Co. E, 9th Wisconsin, was wounded by a musket ball in the elbow, at Newtonia, Missouri, September 30, 1862. He was admitted to hospital at Sarcoxie, and transferred thence to Fort Scott. Surgeon H. Buckmaster, U. S. V., reported, from the latter hospital: "He was shot through the elbow joint, the missile splintering the articular extremities of the bones and wounding the ulnar artery. Profuse hæmorrhage followed at intervals while he was on the way to this hospital, and, arriving here, the brachial artery was ligated just above the elbow; but the patient died of loss of blood within twenty-four hours,—October, 1862.

CASE 1771.—Private A. H——, Co. C, 140th New York, was wounded at Gettysburg, July 2, 1863, and admitted to the field hospital of the 2d division, Fifth Corps. Assistant Surgeon C. Wagner, U. S. A., noted: "Gunshot compound fracture of right elbow joint. Patient transferred to Philadelphia on July 9th." On the following day he entered Satterlee Hospital, whence Acting Assistant Surgeon W. F. Atlee contributed the specimen (FIG. 594), with the following minutes of the case: "Wound in elbow joint, the ball passing through the bone, breaking off the inner condyle and the posterior extremity of the olecranon. Applied angular splints and water dressings. July 17th, some pieces of bone removed. July 26th, some hæmorrhage. July 27th, simple cerate dressings. August 2d, considerable hæmorrhage; took up an artery. August 3d, cold-water dressings. August 4th, hæmorrhage arrested by ligature. August 8th, simple cerate and syrup wash for dressings. August 14th, slight hæmorrhage; bones removed. August 16th, slight hæmorrhage. August 17th, small pieces of the olecranon came off with the dressing, some synovia running from the wound. Wound looking well, with a prospect of healing up. August 18th, patient died." The specimen shows the bones of the right elbow seven weeks after the injury, all the adjoining osseous tissue being carious and much absorbed.

FIG. 594.—Right elbow seven weeks after shot perforation. *Spec.* 2787.

The next case exemplifies the frequent complication of fatal pyæmia, in the course of an expectant treatment of a shot perforation of the elbow, and may be compared with CASE 1766.

CASE 1772.—Private G. S. R——, Co. G, 3d Maine, was wounded at Fredericksburg, December 13, 1862. Surgeon J. M. Cummings, 114th Pennsylvania, reported that he was admitted into a Third Corps hospital for a "gunshot wound of the left arm," and December 23d transferred to Lincoln Hospital, Washington. Surgeon Henry Bryant, U. S. V., reported: "External condyle of the left humerus carried away; preservation was attempted. Died January 13, 1863. Autopsy six hours after death: The lungs and heart were found normal. A metastatic abscess occurred in the liver, on the inferior surface of the lobus major, of one quarter of an inch in diameter. In the spleen numerous small metastatic abscesses were found; some inflammatory congestion of the lower part of the ilium was observed. The left elbow joint was destroyed; the ulna was dead for more than four inches below the articulation, and was completely surrounded by sinuses, so that the bone might have been removed by slight traction from its muscular envelope; the olecranon process was separated. All the articular cartilage was gone, except a little upon the head of the radius. The synovial membrane was, of course, destroyed; the sinuses were full of sanious fluid; the radius did not appear to be dead below the synovial membrane; the humerus was dead for three inches above the articulation." The specimen (FIG. 595), contributed by Dr. Bryant, consists of the bones of the left elbow. The external condyle has been split off and the olecranon destroyed as if by the oblique passage of a bullet. The fractured articular extremities are necrosed.

FIG. 595.—Effects of shot fracture of the left elbow. *Spec.* 678.

There were seven instances of shot wounds of the elbow fatally complicated by tetanus; of which five have been enumerated under the head of amputations of the arm,[1] while two were treated throughout on the expectant plan:

CASES 1773–1774.—Private J. W. McConnell, Co. M, 100th Pennsylvania, aged 24 years, was wounded May 13, 1864, by a conoidal ball, which shattered the right elbow. He was sent to Harewood Hospital on May 26th. Surgeon R. B. Boutecon, U. S. V., reports that, on the following day, "violent tetanic spasms occurred, the attack assuming no particular form. The treatment was antispasmodic, anodyne, and supporting. The spasms continued uninterruptedly, and death ensued June 1, 1864. *The ulnar nerve was found, at the autopsy,* pierced by a sharp splinter of bone, and was lacerated by the ball."——Corporal R. Morrison, Co. I, 55th Massachusetts, was wounded at Honey Hill, South Carolina, November 30, 1864. Surgeon J. Trenor, U. S. V., reported his admission, on December 2d, at Beaufort, with a "shot wound of the outer condyle of right humerus and upper third of ulna by a conical musket ball. Trismus supervened, and terminated fatally December 7, 1864."

[1] As follows: CASE 90 (Nichols), TABLE LXXI, p. 738; CASE 15 (Benbow), TABLE LXXV, p. 751; CASE 85 (*Hunkerfillar*), *Ibid;* CASE 63 (O'Donell), TABLE LXXVII, p. 760; CASE 19 (Haeggle), TABLE LXXXI, p. 773.

Many illustrations of the immediate or remote effects of shot injury of the elbow, besides those here adduced,[1] have been presented in the preceding Section,[2] and many others will appear in the succeeding observations on excisions at the elbow. Examples of projectiles lodged in the elbow joint have been mentioned on pages 769, 830, and 837. The following is one of the most remarkable of those in the Museum:[3]

CASE 1775.—Private A. Hoffman, Co. I, 86th Indiana, aged 26 years, was wounded at Missionary Ridge, November 25, 1863. He was sent from a Fourth Corps hospital, December 3d, to Hospital No. 1, at Nashville, whence Acting Assistant Surgeon M. L. Herr contributed the specimen (FIG. 596), with the following history: "The patient was admitted from Chattanooga, suffering from a severe gunshot wound of the left elbow joint. The missile, a conical musket ball, entered the forearm immediately below the joint and passed upward and outward, fracturing the external condyle of the humerus. On admission, the arm was much inflamed and tumefied, the discharge profuse, dark colored, and exceedingly fœtid; pulse at 90, tongue coated, and appetite impaired. Tonics, stimulants, and nutritious diet were freely used, and cold-water dressings locally. December 12th, discharge from wound the same as on admission. A severe chill occurred to-day. There is much pain, wakefulness, and entire loss of appetite; also icteroid skin. Two grains of sulphate of quinine and three grains of Dover's powder were given every three hours. December 14th, respiration labored; pain in region of liver; great thirst; sordes; skin very yellow; pulse feeble and 120 per minute; respiration 30. Death from pyæmia, on December 16, 1864." A *post-mortem* examination was held twenty-three hours after death, and is described as follows: "External appearance a deep icteric hue. On examining the wound the articulations corresponding to the external condyle were found to be denuded. The tissue immediately in contact with the wound was very dark, of a gangrenous appearance, and filled with dark, fœtid, and purulent matter. On opening the thorax the lungs were found covered with heavy deposits of lymph. The lower lobe of each lung contained several superficial abscesses, also several small circumscribed and hard masses of a light red color. The heart weighed thirteen ounces, and was apparently healthy in texture, except the mitral valves, which were thickened. The liver contained several dark diffused patches, which were soft and interspersed throughout the organ. The gall bladder contained no bile. The liver weighed five pounds and eight ounces; the spleen soft, and weighing one pound and eight ounces. The left kidney weighed eight and a half ounces, was soft in texture, and the pyramids obscure. The right kidney weighed seven and a half ounces and was healthy." The specimen consists of the bones of the left elbow, showing a severe fracture from a conoidal ball which, battered, is lodged in the outer condyle. The outer condyle is destroyed, and a perpendicular fracture extends upward two inches. There is no mention of any attempt to remove the ball.

FIG. 596.—Ball lodged in outer condyle of left humerus. *Spec.* 2192.

It is well to terminate this subsection with at least a brief review of the cases unsuccessfully treated on the expectant conservative plan, lest a superficial survey of figures alone should mislead,[4] and cause that plan to be unduly appreciated. The reader must not lose sight of the fact that, besides the nine hundred and thirty-eight cases of shot injury of the elbow treated expectantly and comprised in this series, there were at least five hundred and forty-three cases of shot wounds of the elbow, and probably many more,[5] that were treated expectantly at the outset; but were ultimately submitted to intermediary or secondary excision or amputation, with fatal results in two hundred and fifty-seven cases, or 47.3 per cent.

---

[1] In the Museum of St. George's Hospital, London, there are two illustrations of the results of conservative expectant treatment of shot wounds of the elbow: *Spec.* 106, Series I, is from W. W———, aged 22 years, and shows a shot comminution of the external condyle and adjacent portion of the shaft of the humerus, and fracture of the ulna. Amputation was practised four weeks after the injury, and death from pyæmia resulted a fortnight afterward, January 4, 1830. *Spec.* 216, of the same series, is from George R——, aged 51 years, a soldier of the Peninsular war, who was wounded in the elbow, in 1810. He had suffered for 22 years from attacks of inflammation of the joint with abscesses. His arm was amputated in September, 1832, and he was discharged cured a month after. A musket ball was found lodged in the cancellous structure of the lower end of the humerus, which was considerably enlarged, as were the upper extremities of the radius and ulna. The articular lamella of each of the bones was extensively destroyed. The ball lay uncovered at the bottom of the olecranon fossa (OGLE and HOLMES, *Cat. of Path. Museum of St. George's Hospital*, 1866, pp. 35, 65).

[2] Viz: Among the records of amputations of the arm, pp. 716–791, eighteen instances, represented by wood-cuts numbered: FIGS, 517, 523, 524, 525, 526, 528, 537, 539, 542, 543, 544, 546, 549, 553, 561, 562, 563, 564.

[3] Descriptions of the following may be consulted in the Catalogue of the Surgical Section, p. 146 *et seq.*: *Specs.* 1578, 2265, 2732, and 4264.

[4] LANGENBECK (B. v.) (*Chirurgische Beobachtungen aus dem Kriege*, Berlin, 1874, S. 165) details a number of cases of shot wounds of the elbow joint, and carefully compares the results of expectant conservative treatment with those of resection, and concludes: "The number of cases of recovery with anchylosis after conservative expectant treatment of shot wounds of the elbow joint, is pretty large. . . The fact that, among the patients treated on the expectant conservative plan and recovered with limited motion or anchylosis, the usefulness of the hand and fingers is sooner restored, will not astonish us when we consider that these were the cases of slighter injury, and that the wounded arm was treated in a more or less flexed position allowing motion of the hand and fingers, while the more severely injured limbs, treated by resection, were generally fastened upon splints with the wrist joint extended and hand and fingers, as a rule, immovably secured for 4 to 8 weeks. . . If, therefore, on a superficial examination or by consideration of figures solely, the scales appear to weigh in favor of the expectant conservative treatment, we will still find, on a more careful examination, that the end-results of elbow resection are not so bad."

[5] There were 197 intermediary and 54 secondary excisions with 74 deaths, and 292 intermediary and secondary amputations with 183 deaths. There were more consecutive amputations, but these are particularized as cases in which expectant treatment was undertaken.

EXCISIONS AT THE ELBOW JOINT FOR SHOT INJURY.—At the outbreak of the War, resection of the elbow joint for the effects of shot injury had been practised in this country but once, and then without success;[1] but the surgeons were familiar with Dr. Esmarch's account of the brilliant series of achievements by which Professors Langenbeck and Stromeyer and their disciples had established this resource as an unquestioned advance in military surgery, and the operation had been done with remarkable success in civil practice, for disease or injury, in thirty cases or more. It was performed, during the War, in a large number of cases, but compared with excision at the shoulder was relatively a less frequent substitute for amputation, and its results, as a conservative measure, must be esteemed, on the whole, less brilliant than those of decapitation of the humerus. The cases are classified in the following table:

TABLE CVI.

Numerical Statement of Six Hundred and Twenty-six Cases of Complete or Partial Excisions of the Bones of the Elbow Joint for Shot Injury.

OPERATIONS.	TOTAL CASES.	RECOVERIES.	FATAL CASES.	RESULT UNKNOWN.	MORTALITY RATE, DETERMINED CASES.
PRIMARY	322	250	68	4	21.3
INTERMEDIARY	197	127	69	1	35.2
SECONDARY	54	49	5	.....	9.2
TIME OF OPERATION UNKNOWN.	53	44	4	5	8.3
Aggregates	626	470	146	10	23.7

It will be observed that the ratio of mortality slightly exceeds the mean fatality of the amputations in the upper arm, practised during the War.[2]

1. Primary Excisions at the Elbow.—There are included in this category the instances reported during the war of formal excision of the ends of either or of all the bones of the elbow. Forty-seven cases treated by extraction merely of splintered detached fragments have been considered in the preceding subsection. A classification dividing the partial from the complete resections of the joint, while preserving the distribution into primary,

[1] Dr. H. H. TOLAND, of San Francisco (*Pacific Med. and Surg. Jour.*, 1858, Vol. I. p. 70), relates an excision at the elbow, in 1856, for caries of two years' standing, following shot fracture, in the case of P. McMahon, aged 40; amputation was resorted to, and the patient died from "phthisis" in 1857.

[2] HUGELSHOFER (A.), of Basel (*Ueber die Endresultate der Ellbogengelenkresection*, in *Deutsche Zeitschrift für Chir.*, 1873, B. III, S. 1), after citing statistics from Professors ESMARCH, SCHOLZ, SALTZMANN, O. HEYFELDER, DOUTRELEPONT, and others regarding the relative percentage of fatality of elbow joint resection and of amputation of the arm, remarks: "Finally, I will refer to a compilation of 315 cases of resections of the elbow performed during the North American War [*Circular No. 6*], with a mortality of 21.67 per cent. in cases of resection of the elbow, compared with 21.24 per cent. in amputations of the arm. These are the only published comparative statistics of elbow joint resections with amputations of the upper arm, in which the latter give a more favorable percentage of fatality than the former. To explain this, the reporter adds the following remark: 'It may be ascribed partly to the fact that the returns for the earlier part of the war include quite a large proportion of partial excisions, which are far more hazardous than complete removal of the articular surfaces.' . . ." In the preliminary report in *Circular No. 6*, I remarked that the conclusions resulting from the returns then examined, representing excisions at the elbow as more dangerous than amputations of the upper arm, "were altogether opposed to the Schleswig-Holstein and Crimean experiences, and will doubtless be modified when the statistics are completed." This anticipation was not realized. The statistics, so far as it has been possible to complete them, corroborate the conclusions expressed in *Circular No. 6*. From the tabular statements on pp. 824 and 845 of this volume, it may be seen that a strict analysis of nearly double the number of cases adduced in the preliminary report (with so small proportion of undetermined instances that there is little room for error) represent the excisions at the elbow, in the aggregate, as slightly more dangerous than amputations of the upper arm: 5,273 amputations, with 1,246 deaths, giving a death-rate of 23.6 per cent.; and 616 excisions, with 146 deaths, a mortality of 23.7 per cent. The difference is very slight, it is true, but is in favor of the amputations. Dr. HUGELSHOFER (although the statistics of excisions at the elbow and amputations of the arm for traumatic, as well as non-traumatic causes, cited by him, show a percentage in favor of excision over amputation) deplores his inability to separate in his returns the traumatic from the non-traumatic cases, and appears to doubt the correctness of the results regarding the non-traumatic cases at least, when he remarks: "*A priori*, it seems not improbable that in such cases the amputation of the arm, in which a far more radical removal of all diseased tissues occurs and a far more simple wound is caused, allows a more favorable *quoad vitam* prognosis than the resection of the joint, which occasioned a much more complicated wound, requiring a greater period for healing. . . As I am not able to prove this assertion by statistical data, I only give it as my subjective view, and far be it from me to proclaim it general truth."

intermediary, and secondary excisions, and those of uncertain date, would be inconveniently complex. The results of four of the three hundred and twenty-two operations are not ascertained. Sixty-eight of the remaining cases, or 21.3 per cent., terminated fatally, a mortality rate higher than that presented by primary amputations of the arm in the same campaigns, or by the expectant conservative treatment; but it would be unwise to conclude from such data that primary excision at the elbow for shot injury was not, under certain circumstances, a most salutary and advisable operation. That such was the conviction of the surgeons of largest experience in the field is proven by the increasing frequency with which the operation was resorted to during the progress of the war.[1]

§ *Recoveries after Primary Excisions at the Elbow.*—Of the two hundred and fifty cases included in this group, there were many that could be only termed successful in the sense that life was preserved. Twenty-seven of the patients ultimately submitted to amputation, and their histories have been alluded to in the preceding Section. Others required operative interference for caries or necrosis or for neuralgic affections. Others suffered from paralysis and muscular atrophy. Of a hundred and ninety-six pensioners, thirteen, at least, have died since their discharge, in most cases from causes more or less indirectly due to their mutilation. Yet a fair proportion of the survivors retain a tolerable control over the functions of the forearm and hand, a smaller number have very serviceable limbs, and, in a very few, the usefulness of the limb is hardly at all impaired. A number of instances of complete and of partial successful primary excisions at the elbow will be narrated, as comparatively few of those of the late war have been published:[2]

CASE 1776.—Private *W. S. Droughom*, Co. C, 60th Georgia, aged 18 years, was wounded at Monocacy, July 9, 1864, and was taken to hospital at Frederick. Acting Assistant Surgeon J. H. Coover reported: "Admitted July 10th. Was wounded by a minié ball, which entered the outer side of the elbow joint, fracturing the head of the ulna and inner condyle of the humerus, thus making its exit on the inner side of the elbow. Exsection of the elbow joint was practised on the day of injury by Surgeon W. L. Graves, C. S. A., by a simple straight incision; the limb was subsequently placed in a tin splint, and, according to the patient, cold-water dressings were used. The patient came under my care August 4th, when I found the arm in a tin splint, with the wound nearly healed, and cold-water dressings applied. I placed the arm in an angular splint so as to allow of passive motion. The wound healed nicely and gave the patient no pain or discomfort whatever. July 28th, the arm nearly healed, and passive motion was made every fair day, so that the arm can now be brought to the patient's mouth and extended almost entirely straight, when transferred to Dr. Mitchell's barracks, August 28, 1864." Acting Assistant Surgeon T. E. Mitchell noted: "August 29th, the patient came under my care, when I found his arm in an angular anterior splint with hinge joint; considerable motion in the joint; wound healed. September 15th, splint removed; patient able to write, though unable to raise the hand to the mouth without assistance. November 7th, at this date patient was transferred to Baltimore. The result of the case was most satisfactory. Patient has almost perfect use of the limb; pronation and supination are normal; flexion and extension are promptly performed; extreme flexion is somewhat interfered with; he cannot touch his shoulder with his thumb on the injured side as he does on the other side. The arm apparently has not been deformed in the least by the injury." The patient was transferred to Fort McHenry for exchange. The specimens figured in the adjacent wood-cuts were contributed by Assistant Surgeon R. F. Weir, U. S. A. The pathological specimen (FIG. 597) consists of the head of the radius, the ulna sawn at the coronoid process, and two-thirds of an inch of the lower extremity of the humerus excised from the right elbow for a fracture of the olecranon and inner condyle. The specimen (FIG. 598) is a cast of the limb after recovery, and represents the arm well flexed in pronation, without deformity.—*Cat. Surg. Sect.*, 1866, p. 536.

FIG. 597.—Rear view of excised right elbow. *Spec.* 3949.

FIG. 598.—Cast of right elbow after excision. *Spec.* 3258.

[1] In the year 1861, but a single primary excision at the elbow for shot injury was reported (TABLE CVIII, No. 28); in 1862, there were 16 cases; in 1863, 66 cases; in 1864, 219 cases; in the early part of 1865, when the war concluded, 20 cases.

[2] Accounts of successful primary excisions at the elbow for shot injury, during the civil war, have been published by Dr. F. FORMENTO, in his somewhat rare *Notes and Observations on Army Surgery*, New Orleans, 1863, p. 51 (Case of Lt. Myatt, TABLE CVII, No. 161, p. 856);—by Surgeon W. O'MEAGHER, 37th New York, in *Notes on the Casualties at Fredericksburg* (*Am. Med. Times*, 1863, Vol. VI, p. 179), referring to the case of General C. F. Campbell (*l. c.*, No. 33, p. 852);—by Surgeon CARLYLE TERRY, P. A. C. S. (*Confed. States Med. and Surg. Jour.*, 1864, Vol. I, p. 76), referring to the case of Sergeant New (*l. c.*, No. 166, p. 856);—by Surgeon G. T. STEVENS (*Trans. Med. Soc. of New York*, 1866, p. 138), detailing and illustrating the case of Sergeant Merriam (*l. c.*, No. 145, p. 855);—by Surgeon J. J. KNOTT, P. A. C. S., (*Report of Cases of Gunshot Wound of the Elbow Joint with partial or total Excision*, in *Atlanta Med. and Surg. Jour.*, 1867, Vol. VII, p. 218), detailing three primary (*l. c.*, Nos. 7, 113, 169) and several resections of uncertain date. It is quite probable that other primary excisions of this joint for shot injury during the campaigns in question may have been published, although they have escaped my notice.

Primary excisions at the elbow were more frequently practised for shot injuries involving the articular extremity of the humerus without lesion of the ulna or radius:

Case 1777.—Private J. Murtagh, Co. B, 69th New York, aged 30 years, was wounded at Fredericksburg, December 13, 1862. Surgeon D. W. Bliss, U. S. V., reported the following history and contributed the specimen (Fig. 599): "The patient is a native of Ireland, of sanguine temperament, robust figure, strong constitution, has always enjoyed good health, and has been in the service four months. He was wounded at 1 P. M., while in the act of firing, the ball taking effect in the right arm. He laid on the field until dark, and then walked more than a mile, into Fredericksburg, where he remained until the next morning. He was carried in an ambulance wagon to Alexandria, where his arm was bandaged and he was placed on board of a transport for Washington. December 14th, he was admitted to the Armory Square Hospital in the night, and no examination was attempted. December 15th, the general condition of the patient is good. Examination showed that the ball entered a little above the external condyle and emerged a little below the internal, causing a compound comminuted fracture of the humerus. The operation of resection was decided upon, and performed at 2 P. M. An S incision was made, commencing two inches above the elbow and extending the same distance below. The bone was found most terribly shattered. Both the condyles were removed, and the bone, as far as denuded of periosteum, taken off with the chain saw. In all, about three inches of the lower end of the humerus was removed, and numerous spiculæ of bone were taken out. The ulna and radius were uninjured, as were also the attachments of the extensors and flexors of the arm. The incision was closed by sutures, the wound where the ball made its exit being deemed a sufficient opening for the discharge of the pus which may be formed. December 16th, the patient has stood the operation well and appears comfortable." On May 12th, the patient was transferred to De Camp Hospital, David's Island, New York Harbor, whence Acting Assistant Surgeon J. W. Dickie reported the following result in the case: "The wound was healed when admitted. There is a space of about one inch between the bones of the upper and lower arms. The motion of the wrist and fingers is not affected. With this exception the arm is useless, as there is no motion, except passive, of the elbow joint. The tissues around the joint are tender." On June 25th, the patient was transferred to the Veteran Reserve Corps at Fort Schuyler, and on April 29, 1864, he was discharged from service and pensioned. In September, 1865, the pensioner was supplied with an apparatus by Dr. E. D. Hudson, of New York City, who described the injured arm as being "shortened one and a half inches." Examiner B. A. Watson, of Jersey City, December 11, 1873, certified: "Gunshot wound of right elbow, followed by excision. The arm hangs powerless at his side. This disability is equal to the loss of a limb for all purposes of manual labor, is total, third grade, and permanent." This pensioner was paid June 4, 1875.

Fig. 599.—Lower extremity of right humerus excised for shot injury. *Spec.* 2224. ½

Case 1778.—Private J. H. Cruver, Co. B, 96th Illinois, aged 22 years, was wounded at Chickamauga, September 19, 1863, and admitted to the field hospital of the 1st division, Reserve Corps, where Surgeon W. Varian, U. S. V., recorded: "Fracture of arm." Two days after the battle the wounded man reached Hospital No. 3, Chattanooga. Surgeon I. Moses, U. S. V., reported: "Wound through right elbow joint, the ball entering outside, opposite the external condyle of the humerus, passing out below and two inches inside of the head of the ulna, completely breaking up both condyles and the olecranon process. September 19th, Surgeon I. Moses removed both condyles and the olecranon process, the coronoid being left. Not a bad symptom occurred during his recovery, which was rapid. He was removed to Murfreesboro' with a good arm, and went on furlough with a very useful hand." The specimen, represented in the annexed cut (Fig. 600), was contributed by the operator, and embraces two inches of the lower extremity of the humerus and a portion of the olecranon. On May 7, 1864, the patient entered the Marine Hospital at Chicago, where a subsequent operation was performed by Acting Assistant Surgeon R. H. Isham, who reported the condition of the injured limb as follows: "Anchylosis of arm, nearly straight, with enlargement of bones; bone carious; fistulous openings; much suppuration, pain, and emaciation. Constitutional condition of patient very fair, but suffering from irritation of the diseased joint. On March 5, 1865, exsection of the elbow joint was re-performed. Uninterrupted good progress followed." The patient was subsequently transferred to Camp Douglass, and lastly to Camp Butler, where he was discharged, September 4, 1865, and pensioned. Drs. W. C. Lyman, E. O. F. Rohr, and F. A. Emmons, of the Chicago Examining Board, September 10, 1873, certified: "Resection of right elbow joint, with complete anchylosis in a flexed position; arm shortened two inches." The pensioner was paid June 4, 1875.

Fig. 600.—Excised lower extremity of right humerus and portion of olecranon. *Spec.* 2144.

Case 1779.—Private U. Howes, Co. E, 1st Massachusetts, age 22 years, was wounded by a shell, at Spottsylvania, May 18, 1864, the missile causing a fracture of the left humerus, involving the elbow joint. He was admitted to the field hospital of the 3d division of the Second Corps, where Surgeon C. K. Irwin, 72d New York, performed excision. On May 25th the patient entered the 2d division hospital, Alexandria, and on July 7th he was transferred to Judiciary Square, Washington. Surgeon T. R. Spencer, U. S. V., in charge of the former, and Assistant Surgeon A. Ingram, U. S. A., in charge of the latter hospital, reported: "Gunshot wound of left arm." The specimen (Fig. 601) was contributed by the operator, and consists of two inches of the lower extremity of the humerus. The appearance simulating periosteal disturbance is due to the mode of preparation. The patient left the hospital for his home on August 5, 1864, his term of service having expired on May 25, 1864, from which date he was pensioned. Examiner H. Clark, of Worcester, Mass., September 15, 1854, certified: "I find the left arm rendered useless by an injury to the heads of the bones forming the elbow joint. The condyles of the humerus are wanting, leaving a loose joint, with scarcely any voluntary motion of the forearm. Disability total and chiefly permanent." Examiner E. Barton, of Orange, Mass., reported, on September 1, 1873: "A fragment of shell struck the arm, fracturing and lacerating the elbow severely; the bones of the forearm are drawn up, shortening the arm some three inches and abridging the use of the arm very much. Disability total." The pensioner was paid June 4, 1875. Compare *Catalogue of the Surgical Section, Army Medical Museum*, 1865, p. 145.

Fig. 601.—Excised lower extremity of left humerus. *Spec.* 3254.

In the two hundred and fifty operations, the precise extent of excision was recorded in one hundred and ninety-four cases, of which sixty-one belong to the group represented by the three preceding abstracts, in which the lower extremity of the humerus alone was removed. In twenty-two operations, illustrated by the next two abstracts, the upper extremity of the radius only was resected; and in thirty-seven instances, of which CASE 1782 affords an example, the olecranon alone, or with the coronoid process or a portion of the shaft of the ulna, was excised:

CASE 1780.—Brigadier-General Max Weber, U. S. V., aged 38 years, received a shot perforation of the right elbow at Antietam, September 17, 1862. Excision of the joint was practised on the field by Assistant Surgeon Charles Heiland, 20th New York, the regiment of which General Weber was formerly colonel. The patient was treated at a Sixth Corps hospital until December 20th, when he was transferred to Washington. Surgeon Thomas Antisell, U. S. V., attending volunteer officers, reported that there was necrosis of the sawn extremities of the bones. The patient was furloughed for sixty days. After some small exfoliations the wound healed, and this officer resigned May 13, 1865, and was pensioned. Examiner James Neill, of New York, reported, September 6, 1865, that: "A bullet wound through the right elbow has resulted in complete anchylosis of the joint at an angle of 45°. The limb is paralyzed, and the hand cold and useless." Examiner T. Franklin Smith reported, November 26, 1873: "Ball entered at the right outer condyle of the humerus, and emerged at the inner surface of the forearm, about midway, carrying away about three inches of the radius. There is complete anchylosis of the elbow joint at a right angle, rendering the patient incapable of feeding himself." Dr. Heiland contributed to the Museum a photograph of the fragment of the radius removed, as represented in the wood-cut (FIG. 602).

FIG. 602.—Head of right radius from an excision for shot injury.

CASE 1781.—Colonel S. S. Carroll, 8th Ohio, was wounded at Spottsylvania, May 12, 1864. Surgeon J. L. Brenton, of the regiment, recorded the injury as follows: "Gunshot wound of left arm; resection of radius." The patient entered the field hospital of the 2d division, Second Corps, where Surgeon J. F. Dyer, 19th Massachusetts, recorded: "Wound of left elbow; cold-water dressings." In a report to the Medical Director of the Army of the Potomac, dated November 4, 1864, Surgeon A. N. Dougherty, U. S. V., Medical Director Second Corps, makes mention of this case as follows: "Colonel Carroll was wounded by a minié ball, which traversed the left elbow. He was brought to the hospital near Alsop's Mills, where I saw him. Before any examination of the injury (which was of course made under chloroform) he insisted that an effort should be made to save the arm, and I assented. The head of the radius was comminuted and the anterior surface of the ulna, including, as I thought, the coronoid process, was broken. I enlarged the wound with the scalpel; with the chain saw I removed the head of the radius, and with the forceps I picked out whatever loose spiculæ of bone presented themselves; then having the wounds patulous, I put up the arm in a hollow obtuse angle splint. After a very exhausting operation, and irritative fever lasting all summer, and accompanied by bed-sores and great emaciation, he is, as I learn by recent advices, recovering slowly but satisfactorily. The wounds are still uncicatrized, and there is complete anchylosis of the joint. He was confined to bed almost three months since he left; since that time he has gained greatly in strength and weight." Colonel Carroll was promoted Brigadier General, U. S. V., on June 14, 1834, and mustered out June 15, 1836. Subsequently he was appointed Lieutenant Colonel of the 21st Infantry, and on June 9, 1869, he was retired from active service with the rank of Major General. Surgeon B. Norris, U. S. A., was requested to report the result in this case, and had the kindness to furnish the following memorandum: "I have read the narrative of the case of Major-General S. S. Carroll, U. S. Army, retired, and can only add that he was under my care, at his mother's house in Washington, D. C., two or three months after the operation of resection of the head of the radius was performed on the field by Surgeon Dougherty. Erysipelas supervened and extended up the arm and over the shoulder, and for two years after he suffered pain and occasionally abscesses, and particles of necrosed bone were discharged. I meet him frequently in the city and at his house in Montgomery county, Maryland. The elbow joint is completely anchylosed. He has use of the wrist joint and of the hand and fingers unimpaired. He can hold the fork firmly in carving at table, and says the arm is invaluable."

FIG. 603.—Excised olecranon. *Spec.* 1378.

CASE 1782.—Corporal J. Moynehan, Co. G, 91st Pennsylvania, was wounded in the right elbow joint, by a minié ball, at Gettysburg, July 3, 1863. He was admitted to the field hospital of the 2d division, Fifth Corps, where Assistant Surgeon B. Howard, U. S. A., on July 5th, performed resection by a single straight incision. The excised parts, represented in the annexed cut (FIG. 603), were contributed to the Museum by the operator, and embraces the olecranon process and a spicula of the shaft, one inch long. A vertical fissure extends nearly through the process. On July 10th the patient entered Ward Hospital, Newark, where Surgeon G. Taylor, U. S. A., recorded his injury as: "Wound of right elbow," and his transfer to the Veteran Reserve Corps, February 4, 1864, by reason of "anchylosis of right elbow." He is not a pensioner. He must have retained a tolerably useful arm, since he was transferred from Co. 136, of the 2d battalion of the Veteran Reserves, to the 1st battalion, in which the more efficient men were employed, by a Board organized by Special Order 28, War Department, Provost Marshal General's Office, May 24, 1864.

The three foregoing operations resulted in complete anchylosis of the elbow. The pension returns indicate that this result was observed in at least eighty-three cases, and partial anchylosis in seventeen cases of this series; and that these terminations were more frequent after the partial than after the complete excisions of the joint. After the

extended excisions of the articular ends of the bones, the opposite inconvenience of a flail-like limb was more common.

CASE 1783.—Lieutenant E. D. Hall, Co. C, 8th Connecticut, aged 29 years, was wounded at Drury's Bluff, May 14, 1864. Excision of the elbow joint was performed on the field, and after treatment in hospitals at Fort Monroe and Annapolis the patient was discharged and pensioned October 5, 1864. The operator, Surgeon M. Storrs, 8th Connecticut, contributed the pathological specimen, with the following history: "Wounded May 14, 1864, by a musket ball, which passed through the outer condyle of the left humerus. I performed the operation a few hours afterward, on the field. A straight incision was made outside the olecranon in the track of the wound; through this the lower end of the humerus in many fragments was extracted. The bones of the forearm, nerves, and blood-vessels were uninjured. These were untouched in the operation; only the condyles and lower end of the humerus were removed, as shown by the specimen, which consists of some twenty pieces glued together. The patient was sent from the field to the general hospital at Fort Monroe, where he made a fine recovery. He has a loose swinging joint, which he ascribes to the treatment—to the extension used, which did not allow the bones to come together. The arm is now (March, 1866) perfectly well; strong to lift; able to carry a pail of water, but rotation of the hand is impaired. The patient is well satisfied with the result as it now is, but by a little mechanical help in the way of a suitable enveloping case for the joint he will have a very strong and useful limb." The specimen (FIG. 604) consists of "three inches of the lower extremity of the left humerus, comminuted by perforation from behind forward above the outer condyle, and excised."—(*Cat. Surg. Sect.* 1866, p. 145.) In March, 1865, Examiner J. Nichols, of Washington, reported: "Gunshot wound of left elbow, with removal of the joint by operation. False point of motion exists; entire loss of use of arm. I doubt its ever being restored for service." On April 27, 1874, Mr. Hall visited the Army Medical Museum, and the photograph represented by the wood-cut (FIG. 605) was then taken. See also photograph No. 350, Surgical Series. In a letter of May 14, 1874, Mr. Hall, then general agent of an insurance company of Meriden, Connecticut, gave the following description of his injury: "I was wounded May 14, 1864, at Drury's Bluff, and had resection of the elbow joint performed by Surgeon Melancthon Storrs, on the field. I was sent to the Chesapeake Hospital, and was there seventy days, when I had leave of twenty days, and on my way back to my regiment was sent to Annapolis Hospital, and there condemned by an Examining Board as unserviceable, and told that I better have my arm cut off, as it would never be of any use to me. I had a case of sheet-iron made and wore it for the first year. I had it well lined with fur. At the end of one year I could go without the case, and my arm did not hurt me much unless I took a misstep and jarred it. I began to get a little use of my fingers, which were very stiff for the first year. For the first three years, the arm pained me most of the time, and used to bother me a good deal of nights; but I find it quite useful now, and I think it paid to run the risk of saving it."

FIG. 604.—Excised lower extremity of left humerus, after shot comminution. *Spec.* 1421.

FIG. 605.—Appearance of elbow ten years after excision for shot perforation. [From a photograph.]

CASE 1784.—Lieutenant A. D. Campbell, Co. F, 45th Pennsylvania, aged 23 years, was wounded at Petersburg, July 30, 1864, and admitted to the field hospital, 2d division, Ninth Corps. Surgeon J. Harris, 7th Rhode Island, recorded: "Gunshot fracture of elbow joint; resection of elbow joint." The patient was transferred to the Depot Hospital at City Point, and thence, on August 25th, to hospital at Alexandria. Surgeon E. Bentley, U. S. V., reported: "Resection of right elbow joint, removing about two inches of humerus and about two inches of radius and ulna. The operation was performed previous to admission, by an incision four inches in length on the posterior aspect of the arm. Patient furloughed October 19, 1864." Acting Assistant Surgeon J. H. Longenecker reported his admission to the Officers' Hospital, Annapolis, November 30th, and described the injury as follows: "A minié ball entered outer side of joint, passed upward and lodged in the inner side of upper third of arm. The wound of resection is healed. There are several abscesses forming, and the arm is inflamed and painful. Flaxseed poultices and afterward dry dressings were applied. The patient continued to improve. He was discharged from service December 12, 1864." Examiner J. Nichols, of Washington, D. C., certified, December 13, 1864: "Wound yet unhealed; ball still remains in wound. Amputation may yet have to be resorted to. Arm useless; prognosis doubtful." In December, 1868, the pensioner was furnished with an apparatus (FIG. 606) by Dr. E. D. Hudson, of New York, who described "the injured limb as being shortened four inches," and stated that "the missile was still embedded under the pectoral muscle." Examiner J. T. Bundy, of Deposit, N. Y., reported, September 4, 1873: "Has a limited use of hand while resting upon a fixed basis, otherwise the arm is useless and rather an encumbrance, frequently becoming inflamed from irritation by spiculæ of bone, which are discharged by ulceration." This pensioner was paid on June 4, 1875.

FIG. 606.—Incomplete recovery after excision at the elbow. [From a photograph.]

Few primary excisions at the elbow for shot injury resulted more favorably than that illustrated in the left-hand figure of PLATE LIII, and the result is the more remarkable when the extent to which the shaft of the humerus was necessarily removed is considered:

CASE 1785.—Captain W. G. Tracy, A. A. D. C., was wounded at Chancellorsville, May 2, 1863, receiving a postero-anterior musket-ball perforation of the inferior extremity of the right humerus. On May 5th, Surgeon H. E. Goodman, 28th Pennsylvania, assisted by Surgeon R. W. Pease, 10th New York Cavalry, excised the joint, removing four and a half inches of the lower extremity of the right humerus. The large portion of the humerus removed, of which two views are presented in the annexed wood-cuts (FIGS. 607, 608), was presented to the Army Medical Museum by the operator. The amount of comminution is very extensive. The operation appears from the cicatrix to have been practised through an H-shaped incision. The nerves have escaped injury, and the muscles have regained attachments advantageously to a remarkable degree. A letter from Captain Tracy, received through the courtesy of Surgeon-General James E. Pomfret, of New York, and dated April 2, 1866, mentions these facts, and that "the bones of the forearm were not touched," and continues: "I returned to the army August 15th, the wound being perfectly healed, the bones remaining disunited, and I continued to serve on the staff of General Slocum until the close of the war. My arm has become about three inches shorter. The muscles have never withered away, and sensation is perfect in the limb. I can write as well as ever [with great elegance, it may be remarked, in passing], but experience some difficulty in raising my arm." Captain Tracy, having served gallantly through the war, resigned at its conclusion, and was discharged October 13, 1865, and pensioned. The reports of the Pension Examining Board at Syracuse for November, 1865, and September, 1875, recapitulate the facts above recorded. In October, 1875, Captain Tracy was in good health, and the usefulness of his mutilated limb had in no wise deteriorated. At this time he had the kindness to have made two photographs of the injured limb, which are bound with the contributed surgical photographs of the Army Medical Museum, one of them being copied in the left-hand figure of PLATE LIII, opposite.

FIG. 607.—Lower fourth of right humerus excised for shot injury. *Spec.* 1155.

FIG. 608.—Posterior view of the same specimen. ½

Another instance, in which an excellent result followed a primary excision of nearly the lower third of the humerus, is presented by the following case:

CASE 1786.—Sergeant C. H. Lovell, Co. D, 14th New York Heavy Artillery, aged 24 years, was wounded at Cold Harbor, June 2, 1864, and taken to the 1st division, Ninth Corps, hospital. Surgeon M. K. Hogan, U. S. V., reported "a gunshot wound of the right arm with fracture of the condyles of the humerus, and that the patient was operated upon, by excision of the elbow, twenty hours after being wounded. On the 9th he was transferred to Lincoln Hospital, Washington, and thence to Philadelphia, entering Mower Hospital July 22d. Surgeon Joseph Hopkinson, U. S. V., recorded the operation as follows: "Gunshot fracture of lower third of right humerus. Excision of four inches of right humerus, commencing at a point one inch above the condyles, by a straight incision four and a half inches in length, over and in the line of the humerus. The patient was in good condition at the time of operation." On September 6, 1864, the patient was discharged and pensioned, his disability being rated one-half. Examiner J. B. Graves, of Corning, New York, September 8, 1864, reported: "Gunshot wound of right arm. Resection of humerus just above the elbow joint, three inches in extent." On June 29, 1865, he reported: "Pieces of bone are working out, and the wound discharging pus continually. Every attempt to use the arm inflames it and lays him up." On January 16, 1866, Dr. E. D. Hudson furnished the patient with a prothetic apparatus, which, from the outset, proved highly useful. At that time the arm was shortened nearly four inches, and slightly atrophied. There was no use of the forearm, but the functions of the hand were normal. When the apparatus was applied, however, the patient was able to lift his forearm and to carry at right angles from the body, and to raise a chair at an angle of 45 degrees. Dr. Hudson contributed the photograph of the pensioner, taken at this time, to the Museum. A reduced copy of it is represented in the adjacent wood-cut (FIG. 609). On October 22, 1866, Examiner J. B. Graves, who reports the patient to be suffering from caries of the lower end of the humerus, with a continuous discharge and pain, rates his disability total and permanent. A communication from Dr. H. C. May, late Assistant Surgeon of Volunteers, dated March 18, 1868, states that this man has been employed for two years as a fireman in a factory at Corning, New York, and is able to do any work at arm's length, like pitching wood, shoveling coal, etc. The Elmira board, consisting of Drs. H. S. Chubbuck, H. C. May, and George Dean, September 5, 1873, reported: ". . Circulation of arm good, and arm well nourished; disability total." This pensioner was paid to March 4, 1874.

FIG. 609.—Results nineteen months after primary excision.

It would be interesting to narrate other cases in detail, and many of the series are represented in the Museum by specimens of the excised parts, or by photographs of the appearances after recovery; but the eleven foregoing abstracts exemplify the principal varieties of the successful primary excisions at the elbow; and it is imperative to compress further references to the group into the subjoined tabular statement.

PLATE LIII. RESULTS AT EXCISIONS OF THE ELBOW JOINT FOR SHOT INJURY.

Fig. 1. Case of Capt. Tracy. - 1785 p. 850

Fig. 2. Case of Pt Riley. - 1797 p. 869

TABLE CVII.

Summary of Two Hundred and Fifty Cases of Recovery after Primary Excision at the Elbow Joint for Shot Injury.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Acher, J. M., Pt., C, 14th Indiana, age 30.	May 12, 1864.	Shot fracture of right elbow...	May 12, 1864.	Olecranon process excised, by Surg. G. W. McCune, 14th Indiana.	Disch'd Nov. 19, 1864; pensioned. Complete anchylosis and paralysis of arm.
2	Allen, C. F., Pt., G, 24th Mich., age 20.	June 3, 1864.	Disintegration of joint by musket ball; excessive hæmorrhage.	June 3, 1864.	Three inches of humerus and radius, through longitudinal incision.	Gangrene. Mustered out May 17, 1865; pensioned. Arm shortened three inches and useless.
3	Allender, J. B., Corp'l, A, 121st Pennsylvania, age 22.	May 8, 1864.	Fracture of upper third of left radius by minié ball.	May 8, 1864.	Excision of elbow joint.....	Arm amputated May 24. Disch'd Sept. 5, 1864; pensioned.
4	Anthony, J. H., Pt., K, 125th New York, age 27.	April 2, 1865.	Wound of right elbow joint by conoidal ball.	April 2, 1865.	Lower two and a half inches of right humerus, by Surg. W. Vosburg, 111th New York.	Disch'd July 6, 1865; pensioned. No union; forearm worthless.
5	Babbitt, O. L., Pt., G, 33d New Jersey, age 23.	May 27, 1864.	Shot fracture of right elbow joint; erysipelas.	May 27, 1864.	Two inches of humerus, thro' an incision three inches long, by Surg. J. L. Dunn, 109th Pa.	Disch'd May 26, 1865; pensioned. Anchylosis; arm useless.
6	Babcock, D. A., Serg't, C, 6th New York Cav., age 24.	Aug. 16, 1864.	Left external condyle and head of radius almost entirely destroyed by gunshot.	Aug. 17, 1864.	Excision.....	Necrosis; total disorganization of joint; Oct. 9, 1864, amputation. Disch'd Dec. 6, 1864; pensioned. *Spec.* 3418.
7	*Bailey, J. T.*, Lieut., H, 51st Georgia, age 25.	Oct. 19, 1864.	Fracture of both condyles of left humerus, involving joint.	Oct. 20, 1864.	Excision of condyles and olecranon process, through longitudinal incision, by Surg. J. J. Knott, 53d Georgia.	Recovered in December with a useful limb.
8	Barber, J., Pt., H, 11th New Jersey, age 20.	May 10, 1864.	Compound comminuted fracture of right elbow by conoidal ball.	May 11, 1864.	Condyles of humerus and olecranon process; three ins. of bone, thro' crucial flap incis'n.	Disch'd Oct. 20, 1864; pensioned. Total loss of use of arm.
9	Barton, J., Pt., F, 1st D. C. Cavalry, age 21.	Aug. 25, 1864.	Right elbow joint fractured by conoidal ball.	Aug. 25, 1864.	Excision of joint.....	Disch'd April 13, 1865; not a pensioner.
10	Beach, O., Pt., B, 1st Michigan, age 21.	June 1, 1864.	Gunshot fracture of right elbow joint, opening it.	June 2, 1864.	Olecranon process and lower end of humerus.	Disch'd Aug. 10, 1864; pensioned. Complete anchylosis; muscular atrophy.
11	Beal, W., Pt., I, 88th Illinois, age 26.	May 17, 1864.	Wound of left elbow joint by conoidal ball.	May 18, 1864.	Excision of four inches of ulna and head of radius.	Disch'd July 19, 1865; pensioned. Total anchylosis at right angle; arm atrophied.
12	Beaumont, T., Pt., M, 9th New York Cavalry, age 20.	Aug. 23, 1864.	Conoidal ball entered elbow, passed through internal condyle, fracturing lower third of left humerus.	Aug. 26, 1864.	Two inches of humerus, condyles, and entire ulna, thro' linear incision, by Surg. R. Curran, 9th New York Cav.	Disch'd June 19, 1865; pensioned. Arm shortened two and a half inches, atrophied, and useless.
13	Behrens, E., Pt., D, 7th New York Heavy Artillery.	Mar. 31, 1865.	Fracture of left forearm, involving elbow joint.	April 1, 1865.	Excision of two inches upper extremity of radius, by Surg. P. E. Hubon, 28th Mass.	Arm amputated April 11, 1865, for hæmorrhage. Disch'd Aug. 2, 1865; pensioned. Died Oct. 9, 1871. *Spec.* 4053.
14	*Belcher, M. H.*, Pt., H, 60th Virginia, age 26.	Sept. 19, 1864.	Conoidal ball fractured bones forming articulation of right elbow joint.	Sept. 22, 1864.	Heads of ulna and radius and condyles of humerus, by Surg. G. L. Miller, C. S. A.	Sent to Provost Marshal April 1, 1865.
15	*Bell, A. H.*, Corp'l, K, 8th Georgia, age 21.	Oct. 7, 1864.	Wound of right elbow joint....	Oct. 8, 1864.	Excision of portion of humerus and ulna.	Furloughed November 10, 1864.
16	Benner, H. H., 2d Lieut., B, 45th Pennsylvania, age 36.	June 17, 1864.	Wound of right elbow joint by musket ball.	June 17, 1864.	Portions of condyles of humerus, by Surg. T. S. Christ, 45th Pennsylvania.	Disch'd Dec. 5, 1864; pensioned. Joint completely anchylosed.
17	*Bentley, J. J.*, Pt., D, 13th Georgia, age 27.	July 9, 1864.	Conoidal ball fractured condyles of right humerus and upper end of ulna.	July 11, 1864.	Two inches humerus and one and a half inches ulna, including olecranon, by Asst. Surg. R. F. Weir, U. S. A.	Sent to Provost Marshal February 11, 1865.
18	Bercaw, S. W., Pt., G, 64th Ohio, age 27.	Nov. 29, 1864.	Fracture of left elbow joint....	Nov. 29, 1864.	Excision of external condyles of humerus.	Disch'd April 17, 1865; pensioned. Anchylosis, with paralysis of forearm.
19	*Bolee, J.*, Pt., C, 8th Louisiana, age 29.	Aug. 29, 1864.	Wound of left elbow joint by conoidal ball.	Aug. 29, 1864.	Excision, by Surgeon J. N. K. Monmonier, 8th Louisiana.	To Provost Marshal February 15, 1865.
20	Borne, H., Pt., I, 139th Pennsylvania, age 22.	May 3, 1863.	Fracture of left elbow joint....	Primary	Excision of olecranon process..	V. R. C. Feb. 5, 1864; pens'd. Complete anchylosis at right angle.
21	Bowers, J. T., Pt., H, 8th Indiana, age 27.	Oct. 19, 1864.	Shot comminution of left ulna, joint opened.	Oct. 19, 1864.	Five inches of ulna excised through straight incision six inches long.	Disch'd June 20, 1865; pensioned. Complete anchylosis; muscular atrophy; arm at times useless.
22	Bradley, C., Serg't, I, 12th Kentucky Cavalry, age 30.	Dec. 14, 1863.	Shot fracture of lower end of right humerus.	Dec. 15, 1863.	External condyles of humerus, through longitudinal incision, by Surg. J. F. Kembley, 11th Kentucky Mounted Infantry.	Erysipelas. Disch'd May 16, '65; pens'd. Complete anchylosis; partial loss of motion of hand.
23	Brooks, W. H., Pt., B, 134th New York, age 35.	Nov. 25, 1863.	Fracture of right elbow joint by conoidal ball.	Nov. 25, 1863.	Upper portion of radius excised.	Disch'd April 2, 1864; pensioned. Anchylosis; arm nearly useless. Died October 11, 1868.
24	Bronk, D. W., Pt., D, 16th Infantry, age 25.	May 28, 1864.	Compound comminuted fracture of left elbow joint by conoidal ball.	May 28, 1864.	Excision of lower end of humerus and olecranon process of ulna through linear incision.	Disch'd Oct. 14, 1865; pensioned. No union; limb perfectly useless.
25	Brown, E., Pt., F, 31st Ohio, age 18.	May 14, 1864.	Olecranon process of left ulna fractured by conoidal ball.	May 15, 1864.	Olecranon excised, and ball removed, by Surg. E. S. Chappel, 31st Ohio.	Disch'd July 20, 1865; pens'd. Full use of joint.
26	Brown, J. W., Pt., B, 97th Ohio.	May 26, 1864.	Conoidal ball fractured left elbow joint.	May 27, 1864.	Upper third of radius and outer condyle of humerus, by Surg. E. B. Glick, 40th Indiana.	July 10th, arm amputated at upper third. Disch'd January 10, 1865; pensioned.
27	Brown, T., Pt., C, 14th New York Artillery, age 30.	July 30, 1864.	Wound of left elbow by conoidal ball; (also fracture of eighth rib.)	July 30, 1864.	Excision of elbow joint.....	Mustered out October 11, 1865; pensioned. Motion of joint good; cannot grasp small objects.
28	Buchanan, T. J. T., Serg't, A, 7th Wisconsin, age 20.	May 5, 1864.	Fracture of right elbow joint by conoidal ball; ulna involved.	May 7, 1864.	Upper third of ulna removed..	Discharged February 11, 1865; pens'd. Anchylosis; no rotation.
29	Buck, A., Lieutenant, E, 8th New Jersey.	May 3, 1863.	Comminuted fracture of head of left radius by conoidal ball.	May 3, 1863.	Head, neck, and two inches of radius, by Surg. C. S. Wood, 66th New York.	Mustered out October 6, 1864. Not a pensioner.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
30	Buckley, T., Pt., C, 32d Massachusetts.	June 6, 1864.	Conoidal ball wound of left elbow joint.	June 6, 1864.	Removal of lower extremity of humerus.	Discharged June 26, 1865. Not a pensioner.
31	Call, S. J., Pt., D, 32d Massachusetts, age 35.	May 12, 1864.	Shot fracture of lower third of humerus, extending into elbow joint.	May 13, 1864.	Lower extremity of humerus, including condyles, excised.	September 8th, amp.; sequestrum found embedded in callus; necrosis. Discharged January 5, 1865; pensioned. *Spec.* 3209.
32	Campbell, A. D., 2d Lieutenant, F, 45th Pennsylvania, age 23.	July 30, 1864.	Fracture of right elbow joint by conoidal ball; parts much lacerated.	July 30, 1864.	Two inches humerus, same of radius and ulna, thro' incision four inches in length.	Disch'd December 12, 1864; pensioned. No bony union; muscles absorbed; arm rather an encumbrance.
33	Campbell, C. T., Brigadier General, U. S. V., age 38.	Dec. 13, 1862.	Fracture of right elbow joint; (also wounds through body, leg, and groin.)	Dec. 13, 1862.	Resection of elbow joint, four inches of ulna, and other bones.	Discharged January 16, 1866; pensioned. Arm almost useless.
34	Carroll, S. S., Colonel, 8th Ohio.	May 12, 1864.	Shot wound of the left elbow, conoidal ball comminuting head of radius and anterior surface of ulna.	Primary	Excision of head of radius and removal of loose spiculæ with forceps, by Surg. A. N. Dougherty, U. S. V.	Promoted Brig. General May 12, 1864; mustered out July 13, 1864. Complete anchylosis.
35	Canala, J., Pt., I, 107th New York, age 36.	May 3, 1863.	Fracture of right forearm by a fragment of shell.	May 3, 1863.	Four inches of ulna and olecranon process, by A. Surgeon C. H. Lord, 102d New York.	Disch'd October 8, 1863; pens'd. Anchylosis; arm useless for labor. *Spec.* 1151.
36	*Cash, W.*, Pt., D., 46th Virginia, age 23.	Sept. 30, 1864.	Conoidal ball entered three inches below left elbow joint, passed through articular surface of ulna and humerus.	Oct. 1, 1864.	Excision of joint through single straight six-inch incision along posterior aspect.	October 20, 1864, good prospect of speedy recovery.
37	*Chowing, W. B.*, Serg't, B, 8th Tennessee, age 22.	Nov. 30, 1864.	Shot wound of left ulna at elbow joint.	Dec. 1, 1864.	Excision.....	Transferred to Provost Marshal March 7, 1865.
38	Christian, F., Pt., B, 12th Ohio Cavalry, age 22.	Jan. 24, 1864	Fracture of left elbow joint by conoidal ball.	Jan. 24, 1864.	Removal of four inches of radius and ulna.	Disch'd June 4, 1865; pensioned. Complete anchylosis; atrophy.
39	Churchill, A., Corp'l, M, 8th Illinois Cavalry, age 21.	June 9, 1863.	Articular surface of right elbow joint comminuted by carbine ball, which entered below joint and was removed three inches above.	June 10, 1863.	Lower portion condyles of humerus, olecranon process, and head of radius, thro' straight incision, by Surgeon A. Hard, 8th Illinois Cavalry.	Slight hæmorrhage and erysipelas. Disch'd Sept. 28, 1863; pensioned. Good use of forearm and hand.
40	Cigler, H., Pt., C, 68th Ohio, age 29.	July 22, 1864.	Fracture of left elbow by minié ball.	July 25, 1864.	Excision of elbow joint.....	Discharged June 26, 1865; pensioned. Anchylosis; cicatrix interfering with motion.
41	Clifford, R., Pt., C, 2d Rhode Island, age 19.	April 6, 1865.	Compound fracture of left elbow by conoidal ball.	April 6, 1865.	Resection of portion of humerus through T incision.	Disch'd June 11, 1865; pensioned. Anchylosis; atrophy; necrosis.
42	Cline, C. R., Pt., D, 24th Kentucky, age 21.	June 20, 1864.	Shot fracture of left elbow joint.	June 20, 1864.	Excision of olecranon process.	Disch'd Jan. 30, 1865; pensioned. Complete anchylosis; can use fingers and hand, but arm weak.
43	Cohler, J., Corp'l, G, 140th New York, age 24.	Feb. 5, 1865.	Fracture of right elbow joint by conoidal ball.	Primary	Partial excision of elbow joint.	Disch'd Aug. 12, 1865; pensioned. No bony union; arm useless.
44	Cole, L. B., 2d Lieut., D, 88th Illinois, age 25.	Nov. 20, 1863.	Fracture of heads of left radius and ulna.	Dec. 1, 1863.	Heads and four inches of shafts of radius and ulna; longitudinal incision over olecranon and down ulna.	Resigned May 4, 1864; pensioned. Some atrophy; shortened two and a half inches; entirely flexible. Died Oct. 26, 1866.
45	Cole, T. W., Serg't, D, 74th Illinois, age 26.	May 14, 1864.	Fracture of right elbow joint by conoidal ball.	May 14, 1864.	Elbow joint, by Surg's W. P. Pierce, 88th Illinois, and H. E. Hasse, 24th Wisconsin.	October 23, 1864, arm amputated. Discharged June 19, 1865; pensioned.
46	Collins, A., Pt., K, 14th Kentucky, age 25.	June 22, 1864.	Left elbow joint fractured by a conoidal ball.	June 22, 1864.	Excision, by Surgeon C. D. Moore, 13th Kentucky.	Arm amputated. Mustered out Jan. 31, 1865; pensioned.
47	Connor, J., Pt., G, 162d New York, age 43.	June 14, 1863.	Wound of right forearm just below elbow by conoidal ball.	Primary	Three inches of ulna, including olecranon, and three-fourths inch of head of radius.	Disch'd Dec. 26, 1863; pensioned. Partial rotation; double inguinal hernia. Died Oct. 13, 1865.
48	*Copeland, J. F.*, Serg't, I, 8th Georgia, age 27.	Oct. 7, 1864.	Compound fracture of left elbow joint.	Oct. 8, 1864.	Excision of a portion of humerus, radius, and ulna.	Retired March 3, 1865.
49	Copley, J. J., Capt., E, 86th New York, age 25.	May 6, 1864.	Fracture of left forearm, upper third of ulna, by a conoidal ball; also fracture of left leg.	May 7, 1864.	Excision of upper fourths of ulna and radius.	May 22, hæmorrhages; ulnar ligated; May 23, hæmorrhage recurred; May 25, arm amputated. Discharged September 27, 1864; pensioned. *Spec.* 2325.
50	Costello, J., Pt., E, 164th New York, age 18.	Nov. 25, 1864.	Wound of left elbow by canister shot.	Nov. 26, 1864.	Resection of three inches lower end of humerus through linear incision, by — Bayard, C. S. A.	Disch'd June 29, 1865; pensioned. Exfoliation; forearm and hand useless.
51	*Cowser, W. P.*, Pt., C, 4th Tennessee, age 25.	May 28, 1864.	Compound fracture, opening left elbow joint.	May 28, 1864.	End of ulna and two inches of humerus, through a V-shaped incision.	Retired Jan. 2, 1865. No union; arm only an encumbrance.
52	Crawford, R. R., 2d Lieut., I, 7th Infantry.	July 2, 1863.	Bones of left elbow comminuted by conoidal ball.	July 2, 1863.	Bones of joint, through an H incision, by Asst Surg. J. S. Billings, U. S. A.	Furloughed October 1, 1863; not a pensioner.
53	Crozier, J., Corp'l, M, 7th Michigan Cavalry, age 20.	June 12, 1864.	Conoidal ball fractured left humerus at elbow joint.	June 12, 1864.	Entire articular surface of humerus excised.	August 22, piece of bone and ball removed. Disch'd June 8, 1865; pens'd. Arm hangs useless.
54	Cruver, J. H., Pt., B, 96th Illinois, age 20.	Sept. 19, 1863.	Shot fracture of condyles of right humerus and olecranon process of ulna.	Sept. 19, 1863.	Two inches of lower extremity of humerus and portion of olecranon, by Surg. I. Moses, U. S. V.; March 5, 1865, re-excision of elbow joint, by A. A. Surg. R. N. Isham.	Disch'd September 4, 1865; pensioned. Complete anchylosis; arm useless. *Spec.* 2144.
55	Curran, J., Pt., I, 14th Wisconsin, age 27.	May 22, 1863.	Right elbow joint fractured by shell.	May, 1863, on field.	Olecranon and two inches of end of humerus, through a single straight incision.	Erysipelas. Disch'd October 9, 1865; pensioned. Firm anchylosis.
56	Cutting, H. P., Corp'l, C, 6th Iowa, age 23.	July 16, 1863.	Compound comminuted fracture of left elbow joint by conoidal ball.	July 16, 1863.	Two and a half inches of radius and ulna and three of humerus, by Surg. W. H. Leonard, 51st New York.	Arm amputated at middle third. Disch'd July 18, 1864; pens'd.
57	Daniels, D., Pt., A, 8th Missouri, age 29.	May 17, 1862.	Ball passed through right elbow joint.	May 18, 1862.	Resection of joint, by Surg. E. Andrews, 1st Illinois Artillery.	Disch'd Sept. 29, 1862; pens'd. No bony union; no control over movements of forearm.
58	Darling, J. J., Pt., E, 31st Ohio, age 19.	May 14, 1864.	Wound of left elbow by a conoidal ball.	May 16, 1864.	Excision of elbow through five-inch incision.	Disch'd Jan. 3, 1865; pensioned. Perfect anchylosis; little use of hand.
59	Davis, C. S., Corp'l, D, 32d Massachusetts, age 19.	May 12, 1864.	Conoidal ball through right elbow; ent'd thorax; removed from right lumbar region.	May 12, 1864.	Excision of elbow joint, by A. Surgeon S. W. Fletcher, 32d Massachusetts.	Disch'd April 22, 1865; pens'd. Firm anchylosis at a right angle.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
60	Dennick, J., Pt., K, 91st New York, age 20.	April 1, 1865.	Shot fracture of head of right ulna.	April 1, 1865.	Head and two inches of shaft of ulna excised.	Disch'd July 15, 1865; pensioned. Arm entirely useless for labor.
61	Dixon, W., Corp'l, K, 143d Pennsylvania, age 22.	May 5, 1864.	Internal condyle of right humerus fractured, and joint opened by a conoidal ball.	May 5, 1864.	Excision May 18; several fragments internal condyle removed through straight incision, by Surgeon Z. E. Bliss, U. S. V.	Hæmorrhage. Disch'd July 20, 1865; pens'd. Anchylosis; caries frequently opens, discharging spiculæ.
62	Donnell, S. P., Pt., H, 11th Missouri, age 20.	May 22, 1863.	Fracture of left elbow joint by conoidal ball.	May 22, 1863.	Excision of elbow joint, by Surg. M. W. Fish, 11th Missouri.	Union by fibrous tissue. Disch'd Oct. 14, 1863; pensioned. Arm useless; false joint.
63	*Dranghon, N. T.*, Pt., G, 60th Georgia, age 18.	July 9, 1864.	Fracture of right elbow by conoidal ball; condyles of humerus and head of radius involved.	July 10, 1864.	Two-thirds of an inch of end of humerus, head of radius, and one and a half inches of ulna, by Dr. Graves, C. S. A.	Good use of forearm and hand. Transferred November 19, 1864. *Specs.* 3238, 3949.
64	Dudley, A. H., Pt., A, 9th New York Heavy Artillery, age 32.	June 1, 1864.	Head of right radius and olecranon process fractured by conoidal ball.	June 1, 1864.	External condyle of humerus, head of radius, and ulna, thro' straight four-inch incision.	Disch'd Nov. 28, 1864; pensioned. Partial anchylosis; arm atrophied and of little use.
65	Durgin, J. P., 1st Serg't, F, 3d Maine, age 39.	May 12, 1864.	Compound comminuted fracture of left elbow joint by conoidal ball.	May 12, 1864.	Elbow joint, through T incision, by Surg. T. Hildreth, 3d Maine.	Disch'd May 4, 1865; pensioned. Complete anchylosis.
66	Durgin, N. S., Serg't, A, 5th New Hampshire.	April 7, 1865.	Fracture of left elbow joint by conoidal ball.	April 7, 1865.	Elbow joint excised, by Surg. W. Vosburg, 111th New York.	Disch'd July 19, 1865; pens'd. Ligamentous union; arm and hand completely useless.
67	*Dyer, J. O.*, Pt., D, 18th Mississippi.	Sept. 18, 1862.	Wound of right elbow joint, involving ulna.	Sept. 18, 1862.	Excision of part of ulna.....	Disch'd December 19, 1862.
68	Ellis, I. N., Pt., C, 103d Illinois, age 25.	Mar. 21, 1865.	Left radius and ulna fractured at upper third by conoidal ball.	Mar. 21, 1865.	Two inches of articular ends of radius and ulna, by Surg. D. Halderman, 40th Ohio.	May 16th, arm amputated. Discharged June 29, 1865; pens'd.
69	England, J., Serg't, K, 16th Pennsylvania Cavalry, age 26.	Aug. 23, 1864.	Fracture of left elbow joint by conoidal ball.	Aug. 23, 1864.	Excision.....	Disch'd Dec. 31, 1864; pens'd. Anchylosis; great atrophy of arm; useless for labor.
70	Ernst, J. C., Corp'l, G, 65th Ohio, age 22.	Nov. 25, 1863.	Head of right radius fractured by conoidal ball; joint involved.	Nov. 25, 1863.	Head of radius excised.....	Disch'd Aug. 18, 1864; pens'd. Anchylosis; forearm flexed at right angle; rotation not lost.
71	Fænger, J. C., 2d Lieut., C, 3d Michigan.	Nov. 30, 1863.	Shot fracture of internal condyle of left humerus.	Dec. 1, 1863.	Excision of condyle, by Surg. H. F. Lyster, 5th Michigan.	Disch'd May 28, 1864; pensioned. Complete anchylosis; rotation destroyed.
72	Farrell, M., Pt., F, 6th New Hampshire, age 22.	July 2, 1864.	Fracture of elbow joint by shell.	July 2, 1864.	Excision of olecranon process of ulna.	Disch'd Oct. 17, 1865; pens'd. Complete bony anchylosis at right angle.
73	Foote, G. W., Corp'l, E, 55th Ohio, age 21.	May 3, 1863.	Right humerus injured by a musket ball.	May 3, 1863.	External condyle of humerus removed.	Disch'd July 9, 1863; pensioned. Limb almost useless.
74	Funk, M., Private, C, 148th Pennsylvania, age 24.	May 3, 1863.	Wound of right elbow joint by a musket ball.	Primary	Articulating portion of humerus removed.	Disch'd Oct. 12, 1864; pensioned. Total anchylosis; great deformity and atrophy of arm.
75	Gannon, J., Pt., D, 126th Ohio.	Sept. 22, 1864.	External condyle of left humerus fractured by conoidal ball.	Sept. 22, 1864.	Excision of fractured condyle	November 7, 1864, amputation of arm. Disch'd June 23, 1865; pensioned.
76	Gardner, W. W., Private, A, 136th New York, age 20.	Mar. 19, 1865.	Fracture of right humerus by conoidal ball; elbow joint involved.	Mar. 19, 1865.	Two inches of humerus excised.	Disch'd June 26, 1865; pens'd. No bony union; arm useless.
77	Garvin, J. F., Pt., F, 1st Michigan Cavalry, age 21.	June 12, 1864.	Conoidal ball fractured condyle of left humerus.	June 12, 1864.	Three inches of lower end of humerus, through straight incision, by Surg. A. R. St. Clair, 5th Michigan Cavalry.	Disch'd June 12, 1865; pensioned. False movable joint; little power of rotation.
78	Gillespie, F. B., Pt., F, 80th Indiana, age 19.	May 14, 1864.	Fracture of head of right ulna by conoidal ball.	May 15, 1864.	Four inches of proximal extremity of bone, through straight incision, by A. Surg. S. K. Crawford, 50th Ohio.	Disch'd March 4, 1865; pens'd. Complete anchylosis of joint.
79	*Goan, J.*, Pt., C, 37th Tennessee, age 25.	Nov. 30, 1864.	Elbow joint fractured by a conoidal ball.	Dec. 1, 1864.	Joint excised through straight incision.	To Provost Marshal January 17, 1865.
80	Good, W., Pt., I, 99th Illinois, age 21.	May 21, 1863.	Ball entered three inches below right elbow and emerged at the joint.	May 21, 1863.	Excision of three inches of upper end of radius.	Complete anchylosis. Disch'd Feb. 3, 1864; pensioned. Fistulous openings; discharge of bone; arm useless.
81	*Goolsby, W. E.*, Lieut., L, 21st North Carolina, age 19.	July 1, 1863.	Compound comminuted fracture of left elbow joint.	July 2, 1863.	Excision of joint.....	Recovered. Transferred December 5, 1863.
82	Gordon, J. I., Corp'l, A, 139th Pennsylvania, age 19.	May 5, 1864.	Left elbow joint fractured by conoidal ball.	May 5, 1864.	Excision of entire joint, by Surgeon G. T. Stevens, 77th New York.	Disch'd Dec. 20, 1864; pensioned. Forearm revolves on arm like a flail; arm entirely useless.
83	Graham, A. S., Corp'l, F, 120th New York, age 24.	Nov. 7, 1864.	Wound of left elbow; lower end of humerus fractured by conoidal ball.	Nov. 8, 1864.	Three inches of lower third of humerus excised, by Surgeon H. F. Lyster, 5th Michigan.	Disch'd June 27, 1865; pensioned. Perfect anchylosis; forearm at a right angle.
84	Green, G. C., Serg't, F, 32d Massachusetts, age 21.	May 30, 1864.	Fracture of right elbow joint by conoidal ball.	May 31, 1864.	Exsection of three and a half inches of humerus.	Disch'd Oct. 16, 1865; pensioned. Arm useless. *Spec.* 4381.
85	Graves, H., Pt., H, 105th Pennsylvania.	May 31, 1862.	Shot comminuted fracture of right elbow joint, involving end of humerus; (also flesh wound of thigh.)	May 31, 1862.	Olecranon process gnawed off with forceps even with end of radius; lower end of humerus turned out and removed with ordinary saw.	Discharged March 26, 1863; pensioned. Artificial joint; arm useless.
86	Gyles, E. S., Pt., G, 179th New York.	July 30, 1864.	Gunshot fracture of upper third of left radius.	July 30, 1864.	Excision of three inches of radius, by Surg. W. V. White, 57th Massachusetts.	Disch'd Feb. 27, 1865; pensioned. Complete anchylosis; atrophy.
87	Hall, E. D., 2d Lieutenant, C, 8th Connecticut.	May 14, 1864.	Comminution of left humerus by conoidal ball.	May 14, 1864.	Three inches of lower end of humerus removed, by Surg. M. Storrs, 8th Connecticut.	Disch'd Oct. 4, 1864; pensioned. False point of motion; use of arm lost. *Spec.* 1421.
88	Hammerly, M., Pt., B, 12th Illinois, age 29.	July 22, 1864.	Wound of right elbow	July 22, 1864.	Exsection, by Surg. J. Zearing, 57th Illinois.	Mustered out Sept. 14, 1864; pensioned. Rotary motion nearly destroyed.
89	Hannan, J., Serg't, G, 11th Kentucky Cavalry, age 19.	June 29, 1864.	Compound comminuted fracture at upper third of left radius by conoidal ball; joint involved	Primary	Excision of head and four inches of radius, by Surg. C. W. McMillan, 1st Tennessee.	Good use of elbow, though partially anchylosed. To V. R. C. March 10, 1865; pensioned. Great atrophy of forearm.
90	Hanrahan, J., Pt., K, 90th Illinois, age 37.	July 22, 1864.	Right elbow joint fractured by conoidal ball.	July 22, 1864.	Excision of joint with two inches of humerus, by Surg. J. A. Hutchinson, 15th Michigan.	Disch'd June 10, 1865; pensioned. Anchylosis with atrophy; limb entirely useless.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
91	Harding, H. J., Corp'l, C, 8th New York Heavy Artillery, age 24.	June 3, 1864.	Shot wound through right elbow joint; ulna fractured.	June 3, 1864.	Five inches upper end of ulna excised through five-inch incision.	Disch'd July 12, 1865. False joint, motion free, rotation lost; hand and forearm useless for labor.
92	Hartings, J., Pt., B, 33d New Jersey.	May 25, 1864.	Right elbow joint severely fractured by a round bullet.	May 25, 1864.	Excision, by Surg. J. Riley, 33d New Jersey.	Duty November 23, 1864. Not a pensioner.
93	Hartwick, M. S., Corp'l, D, 55th Ohio, age 24.	Mar. 19, 1865.	Outer condyle of right humerus shattered by a conoidal ball.	Mar. 19, 1865.	Portion of outer condyle of humerus excised.	Disch'd July 25, 1865; pens'd. Bony anchylosis at angle of 45°.
94	Hathaway, G. W., Pt., D, 40th Massachusetts, age 20.	June 1, 1864.	Fracture of left elbow joint by a conoidal ball.	June 2, 1864.	Elbow joint, through four-inch incision on posterior aspect.	Disch'd Oct. 15, 1864; pensioned. Perfect anchylosis; arm almost useless.
95	Hawkins, A. P., Lieut., E, 8th New York Heavy Artillery, age 20.	Aug. 25, 1864.	Gunshot fracture of lower third of left humerus.	Aug. 26, 1864.	Condyles and one inch of humerus removed through three-inch incision, by Surgeon G. Chaddock, 7th Michigan.	September 1, 1864, amputation of arm; hæmorrhage; brachial ligated. Disch'd Jan. 25, 1865; pensioned. *Spec.* 2010.
96	Haynes, E. C., Lieut., D, 6th Iowa, age 21.	Aug. 22, 1864.	Ball passed through right elbow joint.	Aug. 22, 1864.	Excision of portion of shaft of humerus, by Surg. A. Goslin, 48th Illinois.	Erysipelas; hæmorrhage; arm amputated Sept. 2; hæmorrhage recurred. Disch'd July 21, 1865; pensioned. *Spec.* 3484.
97	*Hays, W. L.*, Pt., I, 44th Alabama, age 30.	Oct. 7, 1864.	Compound comminuted fracture of left elbow.	Oct. 7, 1864.	Three inches of bone from elbow joint, through a longitudinal incision.	Disch'd January 11, 1865. Entirely recovered, without union.
98	Heaton, H., Corp'l, F, 148th Pennsylvania, age 35.	Mar. 31, 1865.	Left olecranon fractured and elbow joint opened by conoidal ball.	Mar. 31, 1865.	Olecranon excised through straight incision.	Disch'd Sept. 29, 1865; pens'd. Complete anchylosis; atrophy; 1872, ulcer discharging.
99	Hinman, G. C., Corp'l, B, 188th Pennsylvania, age 20.	May 14, 1864.	Rifle ball passed from point of elbow down between bones, fracturing ulna.	May 14, 1864.	Excision of two inches of ulna, including the head.	Disch'd Oct. 8, 1864; pensioned. Complete anchylosis; limb useless.
100	Hopkins, G. B., Pt., A, 3d Vermont, age 23.	May 5, 1864.	Bones of right elbow comminuted by conoidal ball.	May 5, 1864.	Partial excision of elbow joint.	Mustered out May 13, 1865; pensioned. Flexion and extension lost; arm useless.
101	Horton, E., Pt., I, 71st Pennsylvania, age 25.	June 4, 1864.	Shell fracture of condyles of right humerus.	June 5, 1864.	Three inches of humerus, including condyles, by Surg. M. Rizer, 72d Pennsylvania.	Disch'd Nov. 29, 1864; pens'd. Arm of but little use for manual labor.
102	Howes, E., Pt., E, 1st Massachusetts.	May 18, 1864.	Fracture of elbow joint; outer condyle of left humerus shattered by a shell.	May 18, 1864.	Two inches end of humerus, by Surg. C. K. Irwine, 72d New York.	Left hospital Aug. 5, 1864; pensioned. Arm shortened three inches, abridging its use. *Spec.* 3234.
103	Hubbard, T. J., Sergeant, C, 8th Connecticut, age 30.	May 7, 1864.	Right elbow fractured by conoidal ball passing through it.	May 7, 1864.	Inferior articular extremity of humerus excised through straight incision.	Disch'd July 11, 1865; pens'd. Anchylosis; forearm flexed; 1873, occasional discharge of pieces of bone; atrophied.
104	Hubner, F., Pt., B, 26th Wisconsin, age 26.	May 26, 1864.	Comp'nd comminuted fracture condyles of humerus by conoidal ball.	May 26, 1864.	Excision of left elbow through six-inch incision.	Disch'd July 20, 1865; pensioned. Joint nearly anchylosed; rotation lost.
105	Hudson, C. W., Pt., C, 140th New York, age 22.	May 6, 1864.	Conoidal ball entered olecranon process and fractured the left elbow joint	May 7, 1864.	One and a half inches end of humerus, two inches radius and ulna, through four-inch linear incision.	Disch'd May 7, 1865; pensioned. False joint; limb useless; will never be restored for labor.
106	Hunt, P., Pt., I, 74th Ohio, age 35.	April 4, 1864.	Shot fracture of upper end of right ulna.	April 5, 1864.	Excision of six inches upper portion of ulna, by A. Surg. A. J. Gilson, 5th Connecticut.	Erysipelas. Disch'd September 17, 1864; pensioned. Permanent anchylosis; cannot flex fingers; forearm atrophied.
107	Ingersoll, G., Pt., E, 47th Illinois.	May 22, 1863.	Fracture of right elbow joint by a shell.	May 22, 1863.	Two and a half inches end of humerus, and olecranon process, by Surgeon H. Z. Gill, U. S. V.	Disch'd Nov. 25, 1863; pensioned. Can do manual labor not requiring elevation of arm.
108	Jackson, J. L., Pt., A, 72d Ohio.	June 8, 1863.	Fracture of olecranon and condyles of left humerus by conoidal ball.	June 8, 1863.	Excision of condyles and olecranon, by Surg. J. B. Rice, 72d Ohio.	Soft joint. Duty Nov. 23, 1863. Disch'd May 31, 1864; pensioned. Separation between bones, two inches; forearm hangs dangling.
109	Johnce, H., Pt., G, 62d Pennsylvania, age 22.	May 12, 1864.	Compound fracture of left elbow joint by a conoidal ball.	May 12, 1864.	Head and portion of shaft of ulna removed.	Hæmorrhage; arm amputated June 4, 1864. Disch'd January 18, 1865; pensioned.
110	*Johnson, G. W.*, Pt., L, 1st Virginia.	July 2, 1863.	Right elbow joint wounded by a conoidal ball.	July 3, 1863.	Resection of right elbow joint.	To City Point November 12, 1864, for exchange.
111	Johnson, J. A., Pt., B, 2d N. Y. M. R., age 23.	June 3, 1864.	Comminuted fracture of heads of left radius and ulna and condyles of humerus.	June 4, 1864.	Excision of joint.....	Disch'd July 14, 1865; pensioned. Complete anchylosis; periostitis and ostitis; arm worse than useless.
112	Johnston, J. E., Pt., B, 122d Ohio, age 19.	June 3, 1864.	Shot fracture of the right forearm.	June 3, 1864.	Head of radius excised through incision six inches long.	Disch'd Mar. 17, 1865; pensioned. Permanent anchylosis; arm of little use.
113	Jones, C. H., Serg't, A, 24th Massachusetts, age 26.	Oct. 7, 1864.	Right elbow joint fractured by a conoidal ball.	Oct. 7, 1864.	One and a half inches end of humerus.	Disch'd Jan. 29, 1866; pensioned. Necrosis of humerus; arm useless.
114	*Jones, J. A.*, Pt., B, 53d Georgia, age 18.	Nov. 29, 1863.	Fracture of radius and both condyles of left humerus; also wound three inches below shoulder joint.	Nov. 29, 1863.	Both condyles of humerus, olecranon process, and three inches radius, through longitudinal incision, by Surg. J. J. Knott, 53d Georgia.	Useful limb; ulna extending beyond radius formed a new olecranon process; no impairment of functions.
115	*Jones, J. A. H.*, Pt., B, 1st Palmetto Sharpshooters.	Oct. 27, 1864.	Wound of right elbow joint...	Oct. 27, 1864.	Excision of joint.....	Furloughed. Recovered.
116	Kelley, W., 1st Lieut., D, 59th New York, age 27.	June 22, 1864.	Fracture of left elbow joint ..	June 22, 1864.	Excision of elbow joint, by Surg. N. Hayward, 20th Massachusetts.	Disch'd Oct. 22, 1864; pensioned. No union; atrophied; no control over forearm; can use hand when arm is supported.
117	*Kerr, W. J.*, Pt., H, 11th Alabama, age 22.	Aug. 16, 1864.	Upper third left radius and ulna fractured by conoidal ball.	Aug. 16, 1864.	Both bones at elbow joint, three inches removed.	Did well. Retired January 2, 1865.
118	Kieffer, T. T., Pt., M, 14th New York Heavy Artillery, age 16.	June 18, 1864.	Fracture right elbow joint by conoidal ball; (also wound through body.)	June 18, 1864.	Head and upper third of radius excised.	Disch'd May 27, 1865; pensioned. Complete anchylosis; cough hectic. Died in May, 1866.
119	*King, C. B.*, Pt., B, 25th Virginia, age 25.	July 3, 1863.	Conoidal ball entered right elbow joint, injuring articular surfaces.	July 3, 1863.	Complete excision of elbow joint; removal of ball.	Gangrene; little motion at elbow. Sent to City Point for exchange March 3, 1864.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
120	King, W., Pt., B, 15th Michigan, age 20.	July 22, 1864.	Left humerus, radius, and ulna fractured at elbow.	July 22, 1864.	Three inches of ulna, end of radius smoothed, by Surg. J. H. Hutchinson, 15th Mich.	Disch'd Sept. 21, 1865; pensioned. Anchylosis and deformity; forearm and hand atrophied; useless for labor.
121	Lane, W. M., Pt., D, 9th New York Cavalry, age 22.	Aug. 25, 1864.	Conoidal ball penetrated right elbow joint, emerging at internal condyle.	Aug. 26, 1864.	Excision of upper portion of ulna through a straight incision.	Disch'd June 15, 1865; pens'd. Anchylosis; arm flexed and entirely useless.
122	Langdon, L., Pt., G, 17th Vermont, age 29.	May 6, 1864.	Fracture of right elbow joint by conoidal ball.	May 6, 1864.	Excision of three inches of shaft and condyles of humerus through linear incision.	Arm shortened nearly two inches. To V. R. C. December 14, 1864; pensioned. Died.
123	Leiblin, W., Pt., C, 20th Massachusetts.	Dec. 11, 1862.	Right elbow joint fractured by conoidal ball.	Dec. 11, 1862.	Lower two inches of humerus and olecranon process excised, by Surg. N. Hayward, 20th Massachusetts.	Arm amputated May 16, 1863. Disch'd August, 1864; pens'd. Died May 23, 1872. *Spec.* 1664.
124	Linsley, J., Private, G, 19th Michigan, age 20.	July 20, 1864.	Compound comminuted fracture of left humerus, involving elbow joint.	July 20, 1864.	Excision of three inches lower end of humerus through five-inch incision.	Erysipelas. Disch'd July 22, 1865; pensioned. Arm entirely useless.
125	Long, D., Pt., D, 72d Indiana.	June 27, 1863.	Gunshot wound of right elbow, comminuting head of ulna; soft parts much lacerated.	June 28, 1863.	Twenty-one fragments—one-third shaft of ulna, also olecranon process, thro' a straight incision, by Surg. I. Moses, U. S. V.	Hæmorrhage, gangrene. Amputation October 26, 1863. Disch'd February 24, 1864; pensioned. *Specs.* 1750, 2129.
126	Lovell, C. H., Serg't, D, 14th New York Heavy Artillery, age 23.	June 2, 1864.	Compound comminuted fracture of lower third of right humerus by a conoidal ball.	June 3, 1864.	Excision of four inches of articulating extremity of humerus through a linear incision.	Disch'd Sept. 6, 1864; pensioned. Extension and flexion of limb and grip of hand perfect; can do any work at arm's length.
127	Lucas, W. R., Pt., A, 10th Missouri.	May 14, 1863.	Shot fracture of left elbow joint	May 14, 1863.	Excision of entire lower end of humerus, including condyles and portion of ulna.	Disch'd Nov. 20, 1863; pens'd. Limb shortened over four inches; forearm hangs powerless.
128	Lyman, W., Serg't, A, 22d Massachusetts, age 33.	June 3, 1864.	Compound comminuted fracture of right ulna by a bullet.	June 6, 1864.	Upper portion of ulna excised through straight incision.	Disch'd Oct. 17, 1864; pensioned. Limb powerless; 1873, false anchylosis.
129	Lynch, C., Pt., H, 20th Massachusetts, age 22.	Aug. 14, 1864.	Shell wound of left elbow joint	Aug. 14, 1864.	Excision of joint through incision four inches long.	Furloughed September 16, 1864. Not a pensioner.
130	Mahon, J. J., Corp'l, G, 69th New York, age 30.	June 3, 1864.	Wound of left elbow joint, fracture of ulna by conoidal ball; articular surface of humerus destroyed by pus; (also w'nd of chest.)	June 5, 1864.	End of humerus above condyles, and ulna one inch below its articular facet, excised through linear incision, by A. A. Surg. E. DeWitt.	Disch'd June 8, 1865; pensioned. Joint weak and requires support; arm useless for manual labor.
131	Martin, J. W., Pt., F, 21st Kentucky.	July 22, 1864.	Shot fracture of left elbow....	July 22, 1864.	Excision, by Surg. C. J. Walton, 21st Kentucky.	Gangrene; August 3, 1864, arm amputated. Disch'd Feb. 23, 1865; pensioned.
132	*Maskew, J.*, Lieut., E, 1st Louisiana, age 23.	July 3, 1863.	Articular processes left elbow destroyed by conoidal ball.	July 4, 1863.	Resection of left elbow joint...	Recovery. Transferred for exchange March 21, 1864.
133	Mason, N., Pt., F, 29th Massachusetts, age 19.	June 17, 1864.	Fracture of shaft and condyles of left humerus by conoidal ball; joint involved.	June 19, 1864.	Two inches shaft and condyles of humerus, through straight incision.	Necrosis; arm shortened three inches. Disch'd Jan. 16, 1866; pensioned. An ulcer covers half of arm; emaciation; arm useless. Died Oct, 24, 1866.
134	*May, J. N.*, Pt., B, 6th Florida, aged 20.	May 31, 1864.	Fracture of right elbow joint..	May 31, 1864.	Excision of four inches of extremity of humerus.	Convalescent from measles. Furloughed July 28, 1864.
135	*McBride, B.*, Serg't, I, 10th Georgia, age 32.	May 3, 1863.	Compound fracture right radius, extending to elbow joint.	May 4, 1863.	Fractured portions through a longitudinal incision.	July 6, erysipelas. Furloughed August 12, 1863.
136	*McGowen, A.*, Pt., Carpenter's Va. Battery, age 24.	Nov. 30, 1863.	Extensive fracture of right elbow joint by conoidal ball.	Nov. 30, 1863.	One and an eighth inches of humerus, three of ulna, and two and a half of radius.	February 28, 1864, doing well. Recovered.
137	McGrath, J., Pt., C, 109th Pennsylvania, age 20.	May 3, 1863.	Left elbow joint fractured by a conoidal ball.	May 3, 1863.	Lower portion external condyle of humerus, by Surg. James L. Dunn, 109th Penn.	To V. R. C. January 11, 1864; pensioned. Complete anchylosis; in good position.
138	McGuire, J., Pt., C, 26th Massachusetts, age 18.	Sept. 19, 1864.	Shot fracture of left humerus and upper portion of ulna, involving joint; (also right radius and ulna fractured at middle third, and wound of jaw.)	Sept. 19, 1864.	Both condyles, and articular surface of ulna—left arm—through incision four inches, by Surg. C. H. Andrus, 176th New York.	Can raise hand to head. Disch'd June 5, 1865; pensioned. Anchylosis of both joints; limbs powerless and useless.
139	McIntyre, jr., T., Sergeant, B, 38th Mass., age 47.	Sept. 19, 1864.	Comminuted fracture of left ulna and internal condyle of humerus.	Sept. 20, 1864.	Four inches of ulna and internal condyle of humerus, by Surg. H. Fearn, 175th N. Y.	Discharged March 11, 1865; pensioned. Forearm and hand are powerless and useless.
140	McManus, P., Pt., I, 20th Massachusetts.	Oct. 27, 1864.	Left humerus fractured by a conoidal ball; joint opened.	Oct. 27, 1864.	Inner condyle of humerus, by Surg. S. H. Plumb, 82d N. Y.	To V. R. C. August 3, 1865. Not a pensioner.
141	McPherson, A., Corp'l, C, 4th Ohio, age 22.	May 24, 1864.	Shell fracture of left elbow joint.	May 24, 1864.	Excision of elbow joint.....	Duty October 7, 1864.
142	McTaggart, C. P., Lieut., K, 3d Michigan.	May 31, 1862.	Comminuted fracture of left elbow joint by a conoidal ball.	May 31, 1862.	Excision of elbow joint	June 1, 1862, arm amputated; Sept. 7, 1863, re-amputation. Mustered out Sept. 24, 1866; pensioned. Appointed Lieutenant March 1, 1867. *Spec.* 1741.
143	Mead, G. C., Pt., C, 10th Vermont, age 22.	June 3, 1864.	Fracture of left radius at elbow by a conoidal ball.	June 3, 1864.	Upper part of radius excised ..	Disch'd June 12, 1865; pensioned. Anchylosis at right angle; some use of hand.
144	Melody, H., Pt., B, 109th New York, age 47.	May 5, 1864.	Right humerus fractured by a conoidal ball; joint involved.	May 6, 1864.	Partial excision of elbow joint .	Disch'd June 5, 1865; pensioned. Complete anchylosis at right angle; atrophy.
145	Merriam, I. B., Serg't, I, 122d New York, age 21.	Sept. 19, 1864.	Outer condyle of right humerus shattered by a piece of shell.	Sept. 19, 1864.	Partial resection of elbow joint, all shattered portions of bone removed, by Surg. G. T. Stevens, 77th New York. A second piece of shell afterward found and removed.	Free use of elbow one month after injury. Disch'd July 1, 1865; pensioned. Sept., 1866, entire anchylosis of elbow joint at right angle; no rotation; atrophy of whole limb; has use of fingers.
146	Meyer, W., Pt., C, 7th Maryland, age 30.	Oct. 8, 1864.	Fracture of right forearm and humerus, involving elbow joint.	Oct. 8, 1864.	Excision of two inches of radius, including head, by Surg. A. A. White, 8th Maryland.	Disch'd June 26, 1865; pensioned. Sequestrum three inches long removed in 1866; anchylosis; arm atrophied and useless.
147	Miller, C., Serg't, H, 15th New York Heavy Artillery, age 25.	Feb. 6, 1865.	Fracture of left ulna	Feb. 6, 1865.	Resection upper third of ulna at elbow joint, by Surg. A. A. White, 8th Maryland.	Disch'd July 17, 1865; pensioned. Joint completely anchylosed at nearly right angle; rotation lost.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
148	Miricle, T., Pt., E, 7th Indiana Cavalry, age 17.	Oct. 20, 1864.	Shot fracture of olecranon process of left ulna by conoidal ball.	Oct. 21, 1864.	Olecranon process, thro' semicircular incision, by A. Surg. S. S. Jessop, U. S. V.	Favorable. To Veteran Reserve Corps May 11, 1865.
149	Mitchell, J., Lieut., B, 4th Artillery.	Mar. 29, 1865.	Gunshot fracture of olecranon process of ulna and head of radius by conoidal ball.	Mar. 30, 1865.	Two and a half inches olecranon process, articular end of radius, through longitudinal incision, by Surg. W. S. Thompson, U. S. V.	Duty October 24, 1865. Died November 13, 1869, while still in the service.
150	Mix, D. N., Serg't, F, 8th Connecticut, age 38.	June 3, 1864.	Fracture of right forearm at upper third by an explosive ball.	June 3, 1864.	Excision of elbow joint.....	Disch'd Jan. 16, 1865; pensioned. March, 1865, portion of missile removed; exfoliation; cannot feed himself with hand.
151	Monaghan, J., Corp'l, G, 91st Pennsylvania.	July 2, 1863.	Fracture of right elbow by a conoidal ball; olecranon fissured vertically.	July 4, 1863.	Olecranon and portion of ulna, through straight incision, by A. Surg. B. Howard, U. S. A.	To Veteran Reserve Corps February 4, 1864; not a pensioner. *Spec.* 1378.
152	Monroe, A. R., Corp'l, B, 11th Infantry, age 24.	May 12, 1864.	Gunshot wound of left elbow joint by a conoidal ball; (also wound of lung, and one on right side of spine.)	May 13, 1864.	Condyloid extremity left humerus, and olecranon process of ulna, through incision five inches long.	Gangrene. Disch'd Dec. 27, 1864; pensioned. Forearm dangles by loose attachment; muscles atrophied; arm useless.
153	Mooney, N., Corp'l, E, 25th Massachusetts, age 20.	June 3, 1864.	Comminution of left elbow joint by a conoidal ball.	June 6, 1864.	Excision of heads of radius and ulna and condyles of humerus through straight incision.	Motion and power of entire extremity retained. Disch'd Oct. 19, 1864; pensioned. Pension Examiner reports forearm useless; free use of fingers.
154	Moore, W. E., Pt., G, 66th Indiana, age 20.	Aug. 11, 1864.	Wound of left arm.....	Aug. 11, 1864.	Condyles and portion of humerus, four and a half inches in all, by Surg. J. Pogue, 66th Illinois.	Disch'd June 18, 1865; pensioned. Forearm entirely useless.
155	Morey, F. A., 1st Lieut., D, 125th New York, age 23.	May 31, 1864.	Wound of left elbow joint by ball.	May 31, 1864.	Excision of external condyle of humerus, by Surg. W. S. Cooper, 125th New York.	Disch'd Jan. 4, 1865; pensioned. Anchylosis at right angle; arm emaciated; unable to move wrist joint.
156	*Moseley, G. W.*, Serg't, K, 9th Tennessee, age 24.	Nov. 30, 1864.	Shot fracture of right ulna one inch below elbow joint by a conoidal ball.	Dec. 1, 1864.	Two and a half inches end of ulna, through five-inch incision, by Surg. Owens, 9th Tenn.	To Provost Marshal February 24, 1865.
157	Moulton, J., Pt., D, 1st Maine Cavalry, age 26.	Aug. 16, 1864.	Gunshot fracture of left elbow joint.	Aug. 16, 1864.	Condyloid extremity of humerus and olecranon process excised through an incision six inches long at back of elbow.	Hæmorrhage; amp. arm, middle third, Aug. 28; re-amp. upper third March 14, 1865. Disch'd Aug. 29, 1865; pensioned. Died December 20, 1869, of lung disease. *Spec.* 3649.
158	Mueller, G. H., Pt., F, 11th New Jersey, age 26.	Mar. 31, 1865.	Fracture of right elbow joint by fragments of shell.	April 1, 1865.	Excision of upper part of radius through six-inch incision.	Disch'd Sept. 18, 1865; pensioned. Complete anchylosis at obtuse angle; arm useless for labor.
159	Murphy, J., Corp'l, D, 139th New York, age 21.	June 2, 1864.	Conoidal ball entered anteriorly one inch above right elbow, making its exit through olecranon process.	June 2, 1864.	Excision of three and a half inches of humerus, radius and ulna.	Anchylosis; false joint; atrophy; forearm useless. Disch'd June 28, 1865; pensioned.
160	Murtaugh, J., Pt., D, 69th New York, age 30.	Dec. 13, 1862.	Comminution of lower end of right humerus; ball passed through condyles.	Dec. 15, 1862.	Two inches end of humerus, both condyles, and spiculæ removed thro' an S-shaped incision, by Surgeon D. W. Bliss, U. S. V.	Passive motion at elbow; motion of wrist and fingers unaffected. To V. R. C. Jan. 25, 1863; pensioned. Arm useless for labor. *Spec.* 2224.
161	*Myatt, H. B.*, Lieut., K, 14th Louisiana, age 26.	June 28, 1862.	Compound comminuted fracture of both condyles of left humerus and olecranon process of ulna by a shell; also wound of inguinal region.	June 28, 1862.	The olecranon sawn off at its base, and humerus resected two inches above the condyles through crucial incision, by Surg. F. Formento, jr.	Furloughed October 29, 1862; rejoined his regiment. Can use his left arm with as much facility as the other.
162	*New, A.*, Serg't, I, 24th Alabama, age 20.	Sept. 19, 1863.	Gunshot wound of elbow joint.	Sept. 19, 1863.	Excision of elbow joint thro' an H-shaped incision.	Favorable; recovered.
163	O'Donnell, M., Pt., H, 8th Pennsylvania Cavalry, age 21.	Aug. 23, 1864.	Fracture of left elbow by a conoidal ball.	Aug. 23, 1864.	Excision of elbow, including about six inches of bone.	Disch'd Feb. 28, 1865. In 1870 Pen. Exam. reports wound unhealed, limb shortened six inches. In 1873 four inches shortening; false joint; necrosis; discharging ulcers.
164	Ohland, F., Pt., H, 2d Michigan, age 20.	Nov. 24, 1863.	Compound fracture of right elbow joint by a conoidal ball.	Nov. 24, 1863.	Excision of right elbow joint, by Surg. G. B. Coggswell, 29th Massachusetts.	Disch'd June 8, 1864; pensioned. Arm hangs by the ligaments, and muscles useless.
165	Oliver, W. M., Pt., B, 174th Ohio, age 18.	Dec. 4, 1864.	Fracture of left radius and ulna by a conoidal ball, involving elbow joint.	Dec. 5, 1864.	Articular ends of radius and ulna, with three inches of shaft, through a T-shaped incision, by Surg. S. D. Turney, U. S. V.	Mustered out May 30, 1865; pensioned. Joint firmly anchylosed; forearm at an obtuse angle; atrophy; loss of use and strength of arm.
166	Owen, C. J., Pt., F, 66th Illinois, age 17.	May 28, 1864.	Conoidal ball passed laterally through right elbow joint, comminuting the bones.	On field.	Excision of lower end of humerus and upper ends of radius and ulna.	Artificial joint; muscles atrophied. Disch'd July 7, 1865. In 1867 arm dangles uselessly at side.
167	Palmer, V., Pt., G, 14th New Jersey, age 50.	Nov. 27, 1863.	Fracture of left elbow joint by a conoidal ball.	Nov. 27, 1863.	Condyles and lower third of humerus, through an incision four inches long, by Surg. J. S. Martin, 14th New Jersey.	No bony union. Disch'd June 11, 1865; pensioned. Arm useless for labor.
168	Pancoast, G. W., Pt., F, 83d New York, age 20.	Sept. 17, 1862.	Fracture of upper third of left radius.	Sept. 18, 1862.	Excision of head and one inch of shaft of radius, by A. Surg. H. Pinkney, 83d New York.	End of radius necrosed, surface of joint carious; amputation of arm Oct. 10, 1862. Disch'd Dec. 23, 1862; pensioned. *Spec.* 772.
169	*Partee, A. C.*, Pt., E, 53d Georgia, age 33.	May 3, 1863.	Fracture of right elbow joint, injuring olecranon.	May 4, 1863.	Both condyles of humerus, with olecranon process of ulna and head of radius, thro' incision nine inches long, by Surg. J. J. Knott, 53d Ga.	Recovered, with a useful limb.
170	Paul, A., Pt., B, 111th Illinois, age 26.	July 22, 1864.	Fracture of condyle of right humerus by a conoidal ball.	July 22, 1864.	Excision of condyle, by Surg. J. C. Morgan, 29th Missouri.	Disch'd June 6, 1865; pensioned. Anchylosis; joint at right angle; arm atrophied.
171	Paulman, C., Pt., B, 115th Pennsylvania, age 38.	May 6, 1864.	Fracture of left elbow joint....	May 6, 1864.	Excision of elbow joint with four inches of radius and ulna.	Disch'd March 4, 1865; pensioned. Forearm hangs by soft parts, and totally useless. Died Mar. 6, '68.

No.	Name, Age, and Military Description.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
172	*Prase, A. N.*, Pt., C, 3d South Carolina, age 23.	July 3, 1863.	Articulating surfaces left elbow joint fractured by a conoidal ball.	July 4, 1863.	Lower end of humerus, and upper end of radius and ulna, through longitudinal incision.	Slight motion of joint. For exchange September 28, 1863.
173	Peck, D., Corp'l, E, 9th New York Cavalry, age 22.	May 5, 1864.	Wound of left elbow by a conoidal ball.	May 5, 1864.	Excision of left elbow joint through an incision five inches long.	Disch'd Aug. 31, 1864; pensioned. Complete anchylosis; arm semiflexed; motion of fingers not much impaired.
174	Pendergast, R., Serg't, A, 2d Massachusetts, age 27.	Dec. 20, 1864.	Conoidal ball passed through right elbow, comminuting lower third of humerus.	Dec. 20, 1864.	Two and a half inches end of humerus, through linear incision over internal condyle, by Surg. P. S. Arndt, 31st Wis.	Duty, June 15, 1865; pensioned. No joint; no use of forearm; worse than useless.
175	Peterson, A. S., Pt., B, 2d Massachusetts, age 30.	Mar. 16, 1865.	Compound comminuted fracture of left elbow by a conoidal ball.	Mar. 16, 1865.	Resection of two and a half inches lower end of humerus through T incision, by Surg. H. Z. Gill, U. S. V.	Passive motion; movement 90°. Disc'd July 26, 1865; pensioned. Arm shortened two inches and forearm hangs by flesh; useless.
176	Phipps, E. P., 1st Lieut., A, 12th New Jersey, age 21.	May 12, 1864.	Shot fracture of left elbow by a conoidal ball.	May 12, 1864.	Excision of elbow joint, external condyle of humerus, and ends of radius and ulna.	Disch'd Sept. 20, 1864; pensioned. Complete anchylosis; forearm semiflexed; impaired.
177	Pollock, A. J., Corp'l, F, 122d Ohio, aged 29.	June 1, 1864.	Wound of right elbow, fracturing external condyle, by a minié ball.	June 1, 1864.	Excision of elbow joint, external condyle.	Disch'd Feb. 8, 1865; pensioned. Complete anchylosis; atrophy of arm and hand. Died Dec. 31, 1869, of consumption.
178	*Poole, J. M.*, Capt., E, 1st South Carolina.	May 24, 1864.	Ball passed through elbow joint.	May 25, 1864.	Complete resection of elbow joint through an H incision.	Furloughed July 23, 1864.
179	Poor, L., Serg't, A, 23d Massachusetts, age 27.	Mar. 8, 1865.	Wound through right elbow joint.	Mar. 8, 1865.	Excision of joint.....	Disch'd June 8, 1865; pensioned. Arm at right angle; strong and useful; cannot put hand to mouth; writes easily.
180	Primrose, W., Pt., F, 8th Colored Troops, age 22.	Oct. 12, 1864.	Fracture of left elbow joint by a conoidal ball.	Oct. 12, 1864.	Excision of elbow joint.....	Discharged April 14, 1865; pensioned. Arm useless.
181	Pringle, J., Pt., F, 11th W. Virginia, age 33.	Oct. 19, 1864.	Comminuted shot fracture of right elbow joint.	Oct. 20, 1864.	Excision of head of radius and internal condyle of humerus through straight incision over olecranon, by Surg C. H. Andrus, 176th New York.	Motion of joint quite limited. Disch'd May 29, 1865; pens'd. No bony union; cannot raise arm, the muscles having no fixed point of attachment.
182	*Pullin, R. H.*, Pt., E, 31st Virginia, age 35.	May 16, 1864.	Ball entered anterior aspect of left elbow joint and passed directly thro', crushing head of ulna.	May 17, 1864.	Excision of head and two inches of shaft of ulna.	Furloughed July 25, 1864.
183	Ratekin, J., Pt., B, 68th Indiana, age 23.	Sept. 19, 1863.	Gunshot fracture of lower end of right humerus; elbow joint opened.	Sept. 20, 1863.	Fractured portion of humerus exsected and ball extracted.	Disch'd November 29, 1864; pensioned. No union; forearm hangs pendant and useless.
184	Reardon, J., Pt., K, 21st Wisconsin.	May 14, 1864.	Fracture of left elbow joint by conoidal ball.	May 14, 1864.	Excision of elbow joint.....	Amputation of arm July 10, 1864. Disch'd June 11, 1865; pens'd.
185	Reynolds, J. F., Pt., I, 13th Indiana Cavalry, age 18.	Dec. 14, 1864.	Fracture of inner condyle of right humerus and upper end of ulna by a conoidal ball.	Dec. 15, 1864.	Head and three and a half inches of right ulna, and condyle of humerus, through T-shaped incision, by Surg. C. H. Bill, 5th Tennessee Cav.	Anchylosis. Mustered out Sept. 30, 1865; pensioned. Angle of flexion 30°; hand and arm weak and nearly useless.
186	Reynolds, O., Pt., B, 137th New York.	Nov. 24, 1863.	Gunshot fracture of left elbow joint.	Nov. 24, 1863.	Excision of left elbow joint, by Surg. C. J. Bellows, 7th Ohio.	Disch'd July 3, 1865; pensioned. Anchylosis at an angle of 45°; the entire limb is atrophied, and useless for labor.
187	Rhonds, S., Pt., I, 58th Indiana, age 32.	Sept. 19, 1863.	Shot comminuted fracture of end of left ulna and humerus; patient weakened by diarrhœa and erysipelas.	Sept. 20, 1863.	Excision of comminuted portion of ulna.	Amputation of left arm at surgical neck Nov. 3, 1863. Disch'd March 15, 1864; pens'd. *Spec.* 2076.
188	Richardson, E. E., Corp'l, H, 80th Indiana, age 28.	May 14, 1864.	Comminuted fracture of left elbow joint by a conoidal ball; also fracture of ilium.	May 15, 1864.	Three inches of lower end of humerus, by Surgeon C. S. Frink, U. S. V.	Disch'd April 14, 1865; pens'd. Hand and arm almost entirely useless.
189	Rockwood, N. P., 1st Lieut., D, 14th Connecticut, age 32.	May 6, 1864.	Fracture of left radius and ulna.	May 6, 1864.	Excision of head of radius, by Surgeon F. A. Dudley, 14th Connecticut.	Disch'd Nov. 30, 1864; pens'd. Anchylosis; arm at a little more than a right angle; powerless.
190	Roe, W. M., Pt., I, 143d New York, age 38.	July 20, 1864.	Shot wound of right elbow joint, fracturing olecranon process of ulna.	July 24, 1864.	Excision of one and a half inches of ulna, by Surgeon D. Mathews, 143d New York.	Duty June 27, 1865; pensioned. Complete anchylosis; muscles atrophied; arm useless for labor.
191	Rogers, H. C., Lieut.-Col., 8th Minnesota, age 31.	Dec. 7, 1864.	Shot fracture of right ulna extending into elbow joint.	Dec. 8, 1864.	Head and two and a half inches of shaft of ulna, through a T-shaped incision, by Surg. S. D. Turney, U. S. V.	Disch'd May 15, 1865; pens'd. Complete anchylosis and loss of use of arm. Died May 8, 1871.
192	*Ruddell, J. L.*, Pt., A, 15th Texas, age 21.	Sept. 1, 1864.	Wound of right elbow joint....	Sept. 1, 1864.	Five inches upper end of ulna excised.	Gangrene. Retired February 18, 1865.
193	Ryan, M., Pt., G, 1st Massachusetts Cavalry, age 24.	May 5, 1864.	Compound comminuted fracture of left humerus by a conoidal ball.	May 5, 1864.	Three and a half inches of condyles and shaft of humerus, through a linear incision over external condyle, by Surg. W. B. Rezner, 6th Ohio Cav., and A. Wood, 1st Mass. Cav.	Disch'd Oct. 26, 1864. In 1865, was able to draw forearm to shoulder; has a useful arm. In 1873, loss of motion in the joint; useless for labor; pensioned.
194	Seace, W. B., Pt., E, 96th Illinois, age 18.	May 9, 1864.	Compound shot fracture of right elbow joint.	May 9, 1864.	Partial excision, by Surg. C. J. Walton, 21st Kentucky.	Disch'd March 8, 1865; pens'd. Partial anchylosis of joint; cannot extend arm beyond right angle; atrophied.
